The Wheats referred to in the following Table are the same as those mentioned in the one above, and while the extraordinary difference between the figures affixed to some of these varieties shows how little "judgment from external characters may be relied on, in reference to the opinions of different individuals," a consideration of these figures with reference to the composition (see 1st Table) of the Wheats, of which they are the prices, demonstrates still more clearly, of how little value the various appearances are, by which Wheat has hitherto been judged of. It must be recollected that the proportion of gluten in Wheat is a main element in its value; the more of this substance flour contains, the more nutritious is the bread, and the more perfect is the operation of baking.

Wheats.	Prices by three Corn Factors.			Prices by three Bakers.			
	s.	s.	s.	s. d.	s. d.	s. d.	
1.	50	50	52 0	52 6	43 0	52 0	Pale Red Cape Wheat, 63 lbs.
2.	53	52	53 6	53 6	52 6	53 0	Duck's Bill Wheat, 63 lbs.
3.	46	46	43 0	51 0	50 0	46 0	Black-jointed Tremaine Wheat, 62 lbs.
4.	42	42	40 0	50 0	*	*	Grano Duro, of which Macaroni is made, 63½ lbs.
5.	40	45	42 0	48 0	*	45 0	Grano Tenero St. Brigida, 63 lbs.
6.	55	56	57 0	55 0	56 0	51 6	From Port Adelaide, South Australia, 65 lbs.
7.	51	50	52 0	49 6	52 0	50 0	Red Wheat, sown after Potatoes, 65 lbs.
8.	50	50	50 0	49 6	48 0	50 0	The same after Lea, 65 lbs.

* These Wheats being new to them they could not fix a value.

"Had the Wheats been mixed samples, a variation in the values might not have excited much surprise; but in the present case the samples were each of one sort, and unmixed; so that there could be no distraction to the eye, every one of the grains in each sample being exactly alike."

Here we see samples 3 and 5, of the same weight per bushel as No. 2, and containing more than double its quantity of gluten, yet valued at 6*s.* and 9*s.* less per quarter. If the quantity of gluten contained in Wheat be the true criterion of its value as food, then the above tables clearly show that the guides, now made use of by millers and bakers in valuing Wheat are not trustworthy.

Most of the Wheats mentioned by Sir G. Mackenzie appear from their names to be foreign, but the great differences which he shows to exist among them seem, from Colonel le Couteur's Paper on this subject in vol. i. of the English Agricultural Society's Journal, to be equally apparent in varieties now commonly cultivated. This is seen in the account given of the quantity of bread made from equal weights of the flour of several kinds of Wheat. To whichever component part of the flour the absorption of water in the preliminary processes of baking is owing, the fact that different quantities are absorbed by different varieties shows that the proportion these component parts bear to one another in those varieties is variable; thus:—

9 lbs. of flour of Bellevue Talavera Wheat made 11 lbs. of bread.
9 lbs. of flour of Whitington White Wheat made 11¾ lbs. of bread.
9 lbs. of flour of Jersey Dantzic Wheat made 12¾ lbs. of bread.
9 lbs. of flour of White Downy Wheat made 12½ lbs. of bread.

It appears, then, from the extracts we have made from Sir G. Mackenzie's valuable Pamphlet, that great differences do exist amongst varieties of Wheat, as regards the quality of their flour, and that no external indication is known by which these differences may be estimated.

ON THE AGRICULTURAL VALUE OF LAND.

(Continued from page 58.)

II. The value of land depends in great measure on the cultivation it has received.

The cultivation of land may be divided into three distinct branches, in each of which it influences the fertility of the soil.

1st—In the application of manures.

2d—In the pulverisation given to the soil by Agricultural implements.

3d—In the nature of the crops cultivated, and the manner in which these are made to succeed one another.

1st—The texture of a soil, though mainly dependent on its mineral composition, and therefore to be permanently improved only by an alteration in its mineral composition, depends, partially, and may, in some degree, be altered and improved by the cultivation it receives. The addition of some kinds of manure to a tenacious soil tends to make it looser, and will improve its texture, but the effect is not permanent, for the manure added becomes decomposed and its effects disappear if a fresh quantity be not applied. Manure, however, does not in general act as a means of improving the texture of the soil, but as a source whence the plants growing on it derive their nourishment.

From the researches of physiologists it appears that plants are incapable of making use of anything insoluble. The roots, through which all nourishment derived from the soil must pass, are terminated by a membranous substance termed a spongiole, which is so fine that nothing in mere mechanical suspension in water, can pass through it. Only those substances, therefore, which are at present soluble, or become so by exposure to the weather, are useful as manures; substances incapable of solution by ordinary natural agents may frequently, indeed, be made use of with advantage to alter and improve the texture of the soil, but they are useless as sources of nourishment to vegetation. The fact that the value of manure depends so much on its solubility seems to be generally neglected amongst farmers. Dung-heaps are often seen placed on some piece of waste land near the farm buildings, and are there suffered to dwindle away during a course of years, that they may be the more thoroughly rotted. One half, at least, of the weight of the manure is thus lost, and this is by far the most valuable half. The rain has carried away to some neighbouring brook all that was soluble in it, and the gases evolved during its decomposition have been given off to the air. The remainder is carried to the pasture lands, but in its then condition it can do them but little good. In some cases, however, the dung-heaps are managed a little better; clay or mould, or the scrapings off the roads being mingled with the manure, tend to retain the liquid and gaseous portions which would otherwise be lost. It is made in yards, where it lies during the summer and autumn, and after being cast up into heaps during winter is carried out to the Turnip-land, where it receives one or more turnings before being spread over the land. Here also, however, the rain is suffered to wash away to the horse-pool or elsewhere the soluble, and therefore the most valuable, part of the dung. Of farm-yard manure generally the two most valuable parts, the washings of the manure, and the urine of the cattle and horses, are lost: these might be collected in tanks in the yards, and being carted out over the arable or pasture land, or being spread over the dung when it was dry, would be found of the greatest value to the farmer.

The following Table gives the result of an experiment re-

garding the use of dung-water as a manure; it was applied in much too small a quantity.

Barleysown	Barley	Straw.	In-crease	In-crease.	Val-of man.	Cost	Pro-fit.	Loss	Soil
	s. c. q.	ct qr lb.	s. c. q.	ct qr lb.	s. d.	s.	s. d.	s. d.	Stone Brash.
Dung-water 200 galls. per acre.	43 0 0	27 3 12	2 2 0	2 3 2	11 10	2	9 10		
Saltpetre 1 cwt.	45 2 0	32 3 12	4 4 0	7 3 12	25 10	28	— —	2 2	
Nitrat. soda 1 cwt.	51 2 1	35 2 24	10 4 1	10 2 24	52 10	20	32 10		
Crop without manure	40 6 0	25 0 0							

A proper attention to the preparation of manure, and to the application of it in kind and quantity suited to the nature of the plant cultivated, would be influential in increasing the fertility of the soil.

2d—The stirrings given to land during its cultivation influence its fertility in two ways: by assisting the decomposition of the manure in the soil, and by giving a depth of loose land in which the roots of the plant may spread. In both of these, the depths of the stirrings and the fineness to which the mould is reduced by them are of the greatest importance. In the state in which manure is generally applied to land, it is useless, it is only after undergoing a process of fermentation in the soil that it becomes a source of nourishment. The products of that fermentation are soluble, and therefore admit of being taken up by the roots of plants. The presence of air is necessary for fermentation, and therefore land is in a proper condition only when in such a state of looseness that air has free access to every part of it. The proper degree of looseness varies, of course, with the plant cultivated. Thus in the case of the Swedish Turnip, which requires large and constant supplies of nourishment, the land should be as loose as possible, not only that the root may be able to increase in bulk, but also that the manure in the soil may rapidly undergo fermentation, while in the case of the Bean, or of Wheat, the nature of the plant requires a considerable degree of firmness. A degree of looseness in the soil and subsoil doubles the resources of the land. It is not liable to injury under extraordinary circumstances, as in the cases of extreme drought, or of extreme wetness. The roots of the plants, in the one case, stretch far downwards beyond the drying influence of the sun and air, whence they can supply the plants with moisture; while in places where the subsoil has been left firm and unstirred, the plants are withered for want of it. In the other case, if the stirring of the subsoil has been effected after a thorough drainage of the land, the plant is uninjured by the rain which, stagnant on land not thus treated, destroys the vegetation covering it. —*M.S.*

(To be continued.)

IN WHAT CONSISTS THE FERTILISING QUALITIES OF BONES?

WHILE every farmer occupying a sandy or peaty soil will acknowledge the incalculable value of bones as a manure, scarcely two practical agriculturists or chemists will agree as to what portion of the bones it is which furnishes the fertilising principle. Sufficient facts, however, seem now collected by the former class of persons, and sufficient analyses made by the latter, to furnish data to enable us to decide this not unimportant question; for it is only by ascertaining the precise fertilising principle of bones, that we can certainly calculate when certain soils are in need of a dressing of them, and when they are an injudicious application.

As regards the practical results of their application, we may safely lay down the ascertained facts, that they are most useful to peats and sands, and least useful to tenacious soils. It is likewise established that they are, of all crops, most useful to Turnips, and succeed when applied alone, in producing many tons per acre, on land which without manure would not mature a single plant.

It is settled, too, according to the authority of Fourcroy and Vauquelin, that bones consist of

Decomposable animal matter	51· Parts.
Phosphate of lime	37·7
Carbonate of lime	10·
Phosphate of magnesia	1·3
	100

Now the question arises, is it the mineral or gaseous principles to which their value is to be referred, seeing they contain these in nearly equal proportions?

To begin with the mineral. Many writers contend that this is the element to which bones owe their value. The Highland Society of Scotland offered the gold medal for the best essay on the subject of the fertilising qualities of bones as compared with farm-yard manure, and the prize was awarded to Dr. Madden, who gave it as his opinion, that the value of bones was principally due to the phosphates which they contain. His calculations, however, have been proved to be fallacious, and are known to be quite erroneous in principle, though at the time they were thought by some to have settled the question.

Now, admitting that about six cwt. of bones is the average application to an acre of land, something like $2\frac{1}{4}$ cwt. of phosphate of lime will be applied to the soil; on the other hand, calculating twenty tons as an ordinary dressing of foid-yard manure for Turnips, and calculating it to contain, on the very lowest average, three per cent. of phosphate of lime, we shall have no less than twelve cwt. of phosphate of lime supplied by it to the crop. If it were the phosphate of lime to which the whole of the credit were due, how does it happen that bones are peculiarly beneficial to Turnips, which, compared with many other plants, contain but a small comparative per centage of it, and why is it not equally efficacious on clay soils, where there is so constant a drainage of their phosphates by taking away the Wheat? and why is it so useful on peaty ground, which generally abounds in phosphates? To show that we have not over-rated the phosphates in farm-yard manure, under ordinary circumstances, we may just refer to Liebig, who gives horses' dung as containing 5 per cent. of phosphate of lime, cows' dung 10 per cent., and straw varying from 7 to 16 per cent.

As regards the very small quantity of phosphate of magnesia, the above remarks apply in greater degree.

Is it, then, the animal matter—consisting principally of gelatine, but also containing some fat, oil, and cartilage, to which bones owe their value? Gelatine, according to Gay, Lussac, and Thouard, consists of the following proportions of—

Carbon	47·88 Parts.
Oxygen	27·207
Hydrogen	7·914
Azote	16·998

It would therefore appear that bones contain about 8 per cent. of azote, and to this we submit, nearly the whole of their fertilising qualities owe their existence. Azote is the principal feature in all powerful or concentrated manures—the base, so to speak (if the term may be allowed in this sense) of all the forms of the nitrates, and the compounds of ammonia—two forms of gas by the quantity of which, as by a standard, nearly all manures may be reckoned in value, because crops supplied with a full quantity of azotised manure invariably excel in luxuriance, being thereby enabled to assimilate a greater quantity of their other constituents.

The great value of bones, moreover, above many other azotised manures, consists in its having its peculiar elements in a state of considerable fixity. While the nitrates require only solution in the soil to set free their azote with great rapidity, and while the various forms of ammonia are even still more volatile, the gelatine in bones requires to be fermented, and to undergo a process of decomposition anything but rapid, before the azote will be given off; and when it is so given off, it is in a way so gradual, as to be in strict applicability to the wants of the plants.

It has been asked, with some degree of confidence, if the bones owe their utility to the gelatine, how does it happen that burnt bones are also in some cases decidedly advantageous applications as manure? The experimenters, however, did not say how they were burnt. If they were burnt to whiteness, so as to crumble to powder, doubtless they would be deprived of the whole of their azotised matter; and if these were equally useful with unburnt bones, doubtless practice would decide against our theory. But if the bones were but partially burnt, only to blackness, or burnt in a confined position, the azote would not be dissipated in any great quantity, but only made more volatile, and therefore likely to produce an equal, if not greater effect upon the crops, though they would not be of such permanent value. For if the burning did partially carbonise the bones the carbon would take up the ammonia, for which it has considerable affinity, and give it off only on the application of excessive moisture. Bones thus burnt may therefore have even a more apparent influence on the first crop, and in its early stages, than unburnt bones; but this rather confirms than invalidates the opinions stated above.—*W. E. N.*

ON MINERAL & INORGANIC MANURES.—No. V.

BY PROFESSOR CHARLES SPRENGEL.

(Translated from the German.)

As it is useful, for reasons which every one may easily guess, that lime should be intimately mixed with the furrow-slice, it is generally brought on the fields during a summer fallow, after which the land is planted in the autumn with winter crops, Wheat, for instance, Rye, winter Barley, Spelt, Rape, &c. The use of lime on fallows is the more necessary, the greater the number of the crops that have been taken off the land. Lime, however, is also very often used for summer crops, viz., for Beans, Vetches, and Peas, which plants require much lime, and are therefore much benefited by it. The Peas grown after being manured with lime have the property of boiling better, and of being nicer to the taste than those grown after dung; the same is the case with Peas grown after the application of marl. We may assume that this property is derived from the nature of its component parts, and limed or marled Peas will probably contain more starch than dunged Peas, the latter on the other hand more *legumen*. Lime, moreover, is useful with other crops also, in producing more starch, whilst dung will promote the formation of nitrogenous substances, such as the legumen in Peas, which does not become soft after boiling; whilst starch, on the other hand, swells and softens the other component parts. This subject being interesting as respects the physiology of plants, shall be more closely adverted to.

If a Potato crop is manured with lime, the roots become not only much more mealy, but more savoury; because lime will not only neutralise the acid of the tuber, but may even form some saccharine matter in them. Again, it is not advisable to manure Flax with lime, to which it will impart a less tenacious and coarser fibre. In Belgium, where they know more about the growing of Flax than anywhere else, it is only after a lapse of seven years subsequent to the application of lime, that it is ever planted on the same field. Still less is the growth of Buckwheat improved by lime, although its ripening may be accelerated thereby. I have found by experiment that 300 lbs. of lime per acre will cause it to ripen eight or ten days sooner than usual, which will be of importance in soils where Buckwheat grows too luxuriantly, or where it continually flowers without forming any grain. Rape will grow exceedingly well after a joint manure of lime and dung, but in this case, only the half of the usual quantity of lime is to be used; and it will also be best that the lime should be well harrowed in, which will prevent it coming into close contact with the dung, which is important for reasons previously stated. All sorts of Cerealia manured with lime will be conspicuous for the grain having very thin husks, and being very heavy and mealy, but there will be less straw than after dung, and it will scarcely ever be laid down. After manuring with lime, the stubbles are generally so clear of grass that they will afford but a poor pasture for sheep, on which account lime manure has often been rejected, but without sufficient ground.

It is to be regretted that the present high price of burnt lime often prevents its application on a large scale, but wherever this does not hinder it, the application of lime should not be neglected, as all fodder, as well as straw grown on it, will be nutritious and wholesome. We have stated so many advantages to be derived from it, that lime must reach a very high price indeed, before its use will cease to be advantageous.

Respecting the quantity of lime which is to be put on a certain area, it is to be observed, that sandy soils require much less than heavy ones. 3000 lbs. per acre is generally sufficient for sandy soils, whilst stiff clayey soils will bear 5000 lbs. In England, where burnt lime, on account of the cheapness of fuel (coals), is so dear, even 10,000 lbs. are applied to an acre. Marshy soils generally require a large quantity of lime, still its effect is not always favourable, as this sort of soil is not only deficient in lime, but also in many other mineral substances, which are absolutely necessary for the growth of plants, as potash, silica, gypsum, &c. The application of lime will produce the greatest effect on marsh land, which is very natural, as it will find there much of the coal of humus ready for decomposition, and it will also be beneficial by changing the protoxides of iron and manganese, which are very abundant in such soils, into peroxides; the former being very noxious, the latter advantageous to vegetation. It kills also all insects, which are plentiful in new marshes, and increases thereby the amount of manure. On account of all these reasons a heavy liming will be required, and according as the soil is loamy, clayey, or sandy, 1000 to 1500 lbs. per acre are to be used. A soil which has entirely run wild and has been exhausted, requires also a strong lime manuring, but it must be soon followed by dung, else the ground will become absolutely useless. It may be put down as a general rule, that the amount of lime must be the greater the more clayey the soil is, the more humus it contains, and the more carboniferous and resinous the humus contained in it is. In fine, lime will act beneficially only where the soil has been previously well drained, which may be caused by the lime forming, as in that case, with the sand a sort of mortar, which becomes insoluble in water, can produce no effect.

In some countries, lime is also used along with wood-ashes, which, as can be easily understood, must produce a very beneficial effect, for wood-ashes contain all the mineral substances necessary for the nourishment of plants, as we shall hereafter see. For this purpose, the lime is placed in a heap, sprinkled over with a little water, and immediately covered with a thin stratum of ashes; the lime gradually slakes, swells, and becomes visible in some spots, after which the heap is stirred through, sprinkled with water, and again covered with ashes, and after the lime has again become inflated, the whole is stirred and worked up. This sprinkling with water, covering with ashes, and working up, is repeated until all lumps of lime have disappeared, and the whole presents a homogeneous pulveriform mass. That such a mixture of lime and wood-ashes will be more active than pure lime may be expected, because besides caustic lime, it contains also caustic potash (which latter has been formed by the action of the lime upon the carbonate of potash in the ashes), and which affects the vegetable remains and the coal of humus more powerfully than caustic lime, and produces from it humic acid after the lapse of a few hours. If the wood-ashes contain also sulphate of potash (as is the case at times), gypsum also will be produced. In order that the caustic potash thus obtained may not attract the carbonic acid of the air and become mild, the mixture is to be used as soon as possible, but also merely on fields which are not yet sown, else the alkali would act very detrimentally upon the plants. At times instead of wood-ashes, peat-ashes are used, in which case however, no such useful mixture will be obtained, as peat-ashes are always deficient in carbonate of potash. Peat-ashes (as we shall see hereafter) act merely by the salts containing gypsum, common salt, phosphate of lime, and magnesia; at times, also, by an admixture of sulphate of potash.

(To be continued.)

CULTURE OF THE LAND FOR WHEAT.

WHEN land is ploughed only to the depth of 3 or 4 inches the active soil is so very limited, that the least change in the weather is injurious to the plants growing on it. The manure which is always applied to the Wheat crop and this system of shallow ploughing forms a layer near the surface; the roots of the plant ramify only through the furrow-slice in which the dung is placed, and consequently the plant has but little hold of the ground. It is thus that severe weather in spring, the plant gets "thrown out," as it is termed, by the frost. The roots having spread out horizontally near the surface are easily exposed to the weather, and whether it be mild or frosty, dry or damp, are entirely under its influence: in a dry season the shallow soil and the manure in it become parched and inactive; in wet weather the roots having but little hold in the ground, a soaking rain and a little wind loosens the plant and it is blown out. Wheat sown on a deep cultivated soil, exerts the whole of its energy, at first, to

production of roots. These strike deeply in the soil, and the whole of it with their minute fibres. The plants may appear thin during winter and in spring—those which turn out the best crops often have this appearance then—but, whenever genial weather comes, the vegetative energies of the leaf being highly excited, are prepared for vigorous and luxuriant growth; and a wide field having been laid under contribution for the purpose, the roots easily provide the nourishment required to support them under it. If a plant in such a condition be pulled up—if the soil be deep, it will be found to have sent out its roots as minute fibres, 18 or 20 inches from it in all directions; it is evident that no variations of weather can affect it, situated thus: it draws its nourishment from sources beyond the influence of the variable-ness of external agents. Thus deep cultivation, by encouraging depth of rooting, *indirectly* effects for the plant a comparative independence of the weather; but it has a *direct* influence in the same direction, for if the weather be wet a great depth of soil readily absorbs the water and conveys it down to the drains; and if it be dry it retains for a longer time a sufficiency of moisture. Of two crops of Corn, equally luxuriant in their growth, that is not so liable to lodge which is grown on the deeper soil, for its growth has been more gradual and natural, and less the result of artificial excitement. The manure in the shallow soil has not had its rankness rectified by mixture with a great mass of earth, and Wheat grown upon it will spring up rapidly but without rigidity; and though it may at one stage of its growth look more luxuriantly, it will at another yield less abundantly than a neighbouring crop which has throughout grown slower and generally promised less. Of course it must be understood that deep cultivation can be safely entered upon only on soils that are naturally or artificially dry. And now a few words as to the depth at which Wheat ought to be planted. We think this has not yet been satisfactorily determined. Nature ought to be our guide in things of Nature; she always drops her seed on the surface; and when it is necessary that any particular seed should get deeper than its natural gravitation would enable it, she provides them with means for the purpose. Thus the Barley and Wild Oat have awns, or beards, by which every motion of the seed pushes it forward; such a seed, lying on the ground, assisted by the wind, very soon wriggles itself beneath the surface. We think, therefore, that the nearer the surface a seed is planted the better, provided it be placed deep enough to protect it from its enemies, the birds, &c. This conclusion at which we arrive is strengthened in reference to Wheat by another circumstance; for, if a Wheat-plant be observed in spring, it will be seen that at whatever depth the seed was originally planted, the lateral roots which it has sent out to supply it with nourishment are always sent out from it at a point not far below the surface, certainly not more than one inch below it.—*John Morton, Chester-hill, Stroud.*

ON GORSE, AS A WINTER FOOD FOR HORSES.

In these times, when the diminished prices of Agricultural produce demand a rigid application of a judicious economy to every expense of cultivation, there is none which requires closer attention than that large item of expenditure—the keep of horses; and yet, because it is not actually paid in hard cash, farmers are in general very careless about it.

The Harleston Farmers' Club have shown in a strong light the necessity of attention to this important point, in the fact, that, when a discussion was raised upon it in the Club, it appeared that a body of excellent managers, in one of the best-cultivated counties in England, upon the same description of soil, and using the same breed of cart-horses, differed in their estimates of the cost of maintaining them by as much as fifty per cent.!

In a recent Number of the "Journal of the Agricultural Society," the experienced Mr. Rodwell has shown at how cheap a rate horses may be kept in the summer by means of that invaluable plant, Lucerne, upon soils, and, it should be added, under a climate, adapted to its growth; for I believe it is a plant which has not been found to thrive in the north of England.

Mr. Rodwell describes the soil on which he cultivated Lucerne with so much success, as a sand upon a subsoil of dry sandy loam. I have always understood that it requires the presence of a considerable quantity of lime. In Kent, it flourishes in deep light soils abounding in calcareous matter, and resting on the chalk. From the geological relations of Mr. Rodwell's land, I should conclude that it likewise contains a considerable proportion of calcareous matter, derived from the subjacent chalk. This view is confirmed by a reference to Dr. Daubeny's table of the constituents of crops, founded on analyses, which, if not all that could be desired in point of accuracy, may be regarded as a good first approximation, and the best guide which we at present possess in these matters. It appears from that table that the quantity of lime contained in a given weight of Lucerne is much greater than that contained in the same weight of red Clover. Of the last, 1000 lbs. contain 584 lbs. of lime; while the same weight of Lucerne contains as much as 1304 lbs. I have seen Lucerne grow very well for a number of years on the non-calcareous soils of Middlesex, which were prepared for it by a dressing of lime or chalk.

There is another plant to which I wish to draw attention, as a food for horses in the winter, which flourishes most on sandy and gravelly soils—it is not necessary that they should be calcareous—but which is hardy and indigenous, and not very limited in its range either of soil or climate in Great Britain and Ireland. This is the Ulex Europæus, the common Furze, Whins, or Gorse.

Botanists make three varieties, or sub-species; two of them, U. Europæus and U. nanus, or dwarf Furze, may be seen on every common; the latter is the most abundant, the former is that best adapted for the food of horses and other cattle, and is the only one of the two worthy of cultivation. It is distinguished from the dwarf Gorse by its more vigorous and bushy growth, rising to the height of from 2 to 5 feet, as well as by the greater succulency of its young shoots. The U. nanus does not attain half this size, and is minuter in all its parts.

A third sub-species, or variety, is the U. strictus of Mackay's catalogue of Irish plants. It was discovered by Mr. J. White, in the park of the Marquis of Londonderry, in the county of Down, and is now well known in our gardens as Irish Gorse. It rarely flowers, but is readily propagated by cuttings. It is easily distinguished from U. Europæus by its smaller size, its dense and compact, rather formal mode of growth, and its upright branches, which are so soft and succulent that sheep and cattle are extremely fond of them; and Mr. Murray, of the Glasgow Botanical Garden, strongly recommends its cultivation for early spring feed. The species, however, which is actually cultivated in some districts for fodder is the U. Europæus.

The Gorse is not indigenous to Sweden, and Linnæus is said to have fallen on his knees in a transport of delight, when he first beheld a large extent of Heath glowing with its vegetable gold. Such a prospect, in the spring, is one of the most exhilirating which I know. Goldsmith has done homage to its beauty; but in his

"blossomed furze, *unprofitably* gay"

has greatly maligned its utility; for a more valuable plant, as a food for horses and milch-kine*, does not exist—to say nothing of its use for fuel, the only purpose for which it is cultivated in the south of England, except as a cover for foxes and game.

In the northern parts of the island, and in Wales, its value as food for horses has long been known; and during the Peninsular campaign, when our cavalry were suffering from want of fodder, some of the troopers who came from those districts cut and bruised for their horses the Gorse, with which the wastes of the country abounded; and the animals were found to thrive so much upon it, that the practice was generally adopted in the Army during the rest of the campaign. In consequence of hearing of this fact, my father proposed to sow a few acres of the poorest part of a farm which he then held with Gorse, as a winter-food for the horses; but my prejudices were against the plan, and I had sufficient influence to prevent its adoption. It was only subsequent experience of its use in Wales which convinced me of its value as a winter-food for horses. I have heard, that when properly bruised, it is equally good for cows, and produces very sweet butter; but on this point I do not speak from experience.—*J. Trimmer.*

(*To be continued.*)

* It has only recently been applied to the latter purpose. At Birmingham, I have been told that a dairy of 200 cows is fed exclusively with it in the winter.

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. IV.

(*Continued from page 37.*)

The next part of the process consists, after bruising the soil gently in the mortar, to pass it through a fine sieve which will retain a Mustard-seed. What remains in the sieve must be carefully weighed and noted down under the head of "coarse sand and undecomposed vegetable fibre."

The powder which passed through the sieve must now be placed in a clean porcelain crucible, boiled for five minutes with about two ounces of distilled water, being stirred during the process with a glass rod, so as completely to divide the particles of soil.

While hot, the contents must be quickly poured into a small narrow glass vessel (a half-pint glass measure will do very well).

In about one or two minutes the contents of the vessel will be found to have divided into two portions; the fine sand will, by its weight, have fallen to the bottom, while the impalpable matter remains dissolved in the water. This supernatant liquid must be carefully poured off into another vessel. If any of the sand has passed with the solution, which is generally the case, it will speedily sink to the bottom, when it can be removed by repeating the process of pouring off.

The vessels containing the sand must now be washed with cold water, and the contents brought into one vessel, at the same time carefully place the solution of impalpable matter on one side, for further operation presently.

It is not possible by this single operation to separate the sand from the powder completely. A little practice and tact will, however, enable any one to separate the two completely, by washing the sand frequently with cold water. This is done by adding a small quantity of distilled water, and shaking the vessel quickly, and at the proper moment pouring off the washing. The water thus used must be added to the solution containing the powder. When the washings remain clear after agitation with the sand, the operation need not be repeated, as it is now free from impalpable matter.

The sand thus separated must now be carefully dried in a clean porcelain crucible, over a spirit-lamp, and then weighed, and the amount noted down as "Fine Sand."

The process of washing and separating the sand from impalpable matter is most difficult with heavy soils; it is not at all so with light specimens.

The next part of the process is very simple. The solution of impalpable matter must be poured into a glass funnel, previously charged with a filtering paper, which has its weight marked upon it. The powder thus collected must be carefully dried, and its weight, after deducting that of the filter, noted down as "Impalpable Matter."

The amount of carbonate of lime in any soil is easily obtained, as follows:—

The coarse sand sometimes contains small lumps of chalk, but unless the soil is "chalky," the amount is inconsiderable in this part of the analysis. There will be no chalk found in the "Fine Sand." It must be sought for in the impalpable matter.

For this purpose, take 50 grains, and dissolve it in a solution of nuriatic acid and water (about half a dram of acid to a dram and a half of water), and set the solution aside for two or three hours. Then add an ounce more water, pass it through a marked filter, and dry as above. The loss in grains, after deducting the weight of the filter, will give the amount of carbonates (which are generally chalk) in the 50 grains operated upon, from which its proportion to the whole soil can easily be calculated.

The process of drying alluded to above is best done by a sand or water bath; where these cannot be obtained, it must be done in the porcelain crucible; but great care is necessary, in thus conducting the process, to prevent the contents from being charred by applying too much heat.

The animal or vegetable matter in the soil can be easily known by exposing a given quantity of the impalpable matter, say 50 grains, to a red heat in a Hessian crucible. The loss will give the requisite result. The oxide of iron and gypsum require a more complicated analysis, which can be found in chemical works.

For all ordinary purposes, however, the analysis has been now carried far enough. The information thus gained is extremely interesting to the farmer. A little practice will render the operations perfectly easy; no chemical knowledge is requisite. A determination to avail himself of the knowledge thus to be obtained, a tolerable share of patience, and the exercise of ordinary tact, will be all sufficient. The method is similar to that described by Sir H. Davy.

The paper of the late lamented Mr. Rham upon the same subject, in the "Agricultural Journal," is well worthy of perusal. My principal objection to it is the indefinite application of the terms clay and humus.

The table of M. Tnaer is still more ambiguous. The term clay is incomprehensible as an element of Chemical analysis. The less "impalpable matter" in a soil, the more sand will be found, and *vice versâ*. Clay is, in fact, "impalpable matter," and water with an excess of aluminous earth.

By the simple process I have described, then, the farmer will obtain in a very short time the following information about his soils:—

1st, Amount of moisture, showing the capabilities of the soil in retaining or parting with this important element.

2d, The amount of coarse sand, gravel, or undecomposed vegetable fibre.

3d, Fine sand, without which no soil is fertile.

4th, Impalpable matter, which is of the utmost importance, not only as containing the principal inorganic elements in the food of plants, but as having a most important bearing upon the fertility of soils, in the proportions in which it exists to that of the sand.—*C. R. Bree, Stowmarket.*

(*To be continued.*)

Home Correspondence.

Shed-Feeding Sheep.—My attention has been given to the Leading Article in your publication on the 13th inst., in which the subject of Shed-feeding sheep has a prominent place. I am not at all surprised that Mr. Childers has ascertained by actual experiment that "the sheep in the shed, though they consumed nearly one-fifth less food, made above one-third greater progress" than those which had been folded in the field. Shelter and warmth to all animals when fattening are most essentially important, and I have no doubt that the farmers who fold their sheep on open Turnip-fields in cold wet weather lose considerably by doing so, and would find their advantage (without our dwelling on the cruelty of the prevailing contrary system) in providing such cheap and easily-formed shelter as you have recommended. It is not long since I have seen sheep in the south of Scotland, during the most penetrating rain and snow storms, up to their knees in the mire of a clay field, which was almost bare of Turnips, and without the possibility of obtaining greater shelter than the wet ditch of a leafless hedge three feet high afforded them; there they lay cowering from the pitiless blast in misery, from day to day. And this was the systematic treatment pursued there towards store-sheep, with hardly an exception. The loss sustained in the comparative waste of manure, and in the condition of the sheep, by not taking to them Hay and Turnips, in covered sheds with yards during the severity of weather, is inconceivably great. But "the opinions of any agricultural correspondent, however safely built upon facts, are not (as you have judiciously stated) necessarily of general application, because that which is fact in his neighbourhood may not be fact elsewhere." What may be the best treatment for Leicester Hogs put up to fatten in a district where Turnips constitute the principal winter and spring food, may be totally inapplicable to other varieties of the species, under other circumstances of age, habits, soil, and climate, even within the limits of the same county or province. There are many breeds of sheep, for instance, which require, from their nature and peculiar habits, a constant liberty of range and free ventilation, and many localities in which they would nearly starve if they were restricted from roaming about, without any other means of obtaining shelter than the lea side of a hill or furze-bank, or stone wall. I shall suppose the case of the

blackfaced or Cheviot sheep; these, if confined in warm houses, would be injured in health, and after a few generations, rendered so delicate by the natural transmission of new habits, and even of physical conformation, as to be unfit for their native pastures. Those nomadic tribes accustomed to brave the wintry blast, and scrape up their scanty food from under a covering of snow, would become diseased, or perhaps die of *ennui*, if confined in close sheds and fed luxuriously. The Cheviot sheep farmer well knows that the healthy condition of his flock is preserved by their being kept out on the hills as long as a blade of grass can be cropped from the ground, and he is unwilling to divide among them even a few plaid-fulls of the bog hay which has been cut and stacked for them near the stells, as long as they can procure any food for themselves, lest they should become indolent and lose the robust vigour which active exercise imparts to them. But some shelter is necessary for the mountain sheep, of which countless thousands have at different periods perished from the want of it. Until stells were built to save them from snow-drifts, there often was no chance of saving them from being smothered in heavy snow-storms, but mere rain, or even cold wind, unaccompanied by much snow, are not dreaded if their range permits them to obtain the shelter of a hollow, or even of a hill-side on which the wind does not blow: necessity alone causes them to enter any of the numerous stells, which the good sense and humanity of the late Lord Napier, and other land-proprietors in Scotland have so liberally built, where the eddying winds are least likely to affect them. Sheep, like those in the hill districts, would feel a sense of suffocation if they were inclosed in a covered shed within a close country; and I think that all flocks, except the individuals of them which are actually fattening, enjoy more health in the open air, but with liberty to rest under some natural shelter, or such artificial shelter as consists with their liberty of movements, from wind or rain than if housed. For ewes in young, air and exercise and perfect freedom seem to be most necessary; but whether near the mountain or in the inclosed vale, an hospital should be provided for the sick, a small park for the tups, an inclosure for lambing and feeding-sheds, such as those represented in your plate to some extent. In short, the principle of affording shelter to sheep is most just and necessary; though confinement in sheds is unsuited to the nature and condition of the hardy varieties, which depend on their fleecy great coats for warmth, and which, if shut up in a warm place in their dripping raiment, would emit morbific evaporations. High-bred Leicesters, or other lowland sheep of the same indolent habits (comparatively with the mountain tribes) are only suited by their nature to lowland districts, where hedge-rows and plantations usually afford sufficient shelter, except in extremely severe weather; and therefore, except for the purpose of accelerating the process of fattening or sheltering flocks of sheep where there is not sufficient Grassland for their keep, as in many of the purely tillage farms of Great Britain, thatched sheds may be altogether dispensed with. You perceive, Sir, that my exceptions in favour of your system are few, and only such as any practical sheep-farmer would admit to be reasonable.—*Martin Doyle.*

Shed feeding of Sheep.—I am perfectly satisfied of the fact, so fully proved by Mr. Childers' valuable experiments, and dwelt upon in a late Number of your Paper, that sheep fed in sheds will produce much more mutton in proportion to the quantity of food they consume, than others allowed to go at large in the open field, exposed to all the variety of weather, and induced to take much more exercise. I have tried such experiments myself, and occasionally with much success; frequently, however, the whole advantage has been thrown away at the end, by the sheep being attacked—as they are very apt to be when confined for a length of time upon litter, which will hold a good deal of moisture, though often renewed—by a disease in the feet of so painful a nature, as to cause them to lose more flesh before it can be cured than they will recover in a month afterwards. The disease is the same, though I think more virulent, owing, perhaps, to the higher feeding to which the animal has been subjected, as that known by the name of foot-rot, or foot-halt, common to sheep fed in rich pastures, and in damp seasons. This circumstance is a great objection to the mode of feeding sheep in my case, and it may be presumed to be so in others; and it is desirable to know both how the evil may be prevented and cured.—*John Grey, Dilston.*

Sprengel on Inorganic Manures.—As your Paper is not intended for Chemists, it is requisite that the facts which it professes to give should be accurate and clearly expressed. The translation of Sprengel's lecture on Mineral Manures in your last No. (Jan. 20) is, I fear, wanting in both these essentials. Take the following specimens:—"By the action of quicklime, organic matter is converted chiefly into humic acid. To this, lime bears a strong affinity, and if previously combined with water it will lose it again through the above combination; the new compound, however, will again combine with water." Now to say that lime bears a strong affinity to humic acid, means, if it means anything, that it bears a strong resemblance to it, and no doubt it would be so understood by nine out of every ten of your readers. The sentence might, perhaps, have been more intelligible thus:—"By the action of quicklime, organic matter is converted chiefly into humic acid, with which the lime then enters into combination, forming a humate of lime, it having a strong affinity for that acid." The next paragraph is full of inaccuracies. We are told that caustic lime is soluble in water, "but 752 lbs. of water at 168° Fahr. are required to dissolve 1 lb. of calcareous earth." Now, according to Dalton, 750 parts of water at 60° are necessary to dissolve 1 pint of lime, and, which is a remarkable fact, the hotter the water the less lime it will dissolve; so that at 212°, 1280 pints of water are requisite. But why take the temperature 168°? What the farmer is chiefly concerned in is the solubility of lime at an ordinary temperature, 60°. And why use the words "calcareous earth?" by which he evidently means pure lime, though most people would think he meant limestone, or earth containing a quantity of carbonate of lime. He goes on;—"It (lime) is easily soluble in water if free from carbonic acid, and to this its action on the organic matter of the soil is owing!! In order that substances may act upon each other, one at least must be in a liquid state, and this explains why caustic lime dissolved in water will injure vegetation." Is a farmer to understand, then, that a heap of quicklime thrown on a grassplot would not kill the grass, but that watering it with lime-water would? The truth, probably, is, that quicklime destroys vegetable matter, (*i.e.*, causes the element to form new combinations), owing to its affinity for water and acids, and therefore, when mixed with vegetable matter it converts the oxygen, hydrogen, and carbon chiefly into water and humic acid. —*Crito.* [Probably the error of naming 168° as the temperature at which 1 of lime is soluble in 752 of water, was owing to the figures in the original being mistaken for centigrade degrees, and so reduced to those of Fahrenheit's scale.]

Experiments with Various Top-Dressings.—The following experiments were tried upon a mixture of equal parts of brick-clay and sand. The clay was dug from 20 feet below the surface, and clean white sand was intimately mixed with it, and the whole was put into beds upon a surface of white clay, each partition being carefully divided. Barley was sown on the 5th of March, and the top-dressings were applied on the 15th of April, as per Table, to each partition,—with the intention of its being in a manner a key to experiments with the same kinds of manure, sown, in the same proportions, in the field, in square rods and chains. The object of these experiments was to ascertain whether certain salts, &c. were mere stimulants or manures. There being no animal or vegetable matter in the mixed brick-earth and sand in the beds, if any effect resulted from these applications, the manures must be of a positive character; but a perusal of the following will give an idea of their relative effects, both upon the pure earth and upon the arable land:—

Manures.	Quantity, at the Rate of per Acre.	Value of Samples, from the Artificial Soil, per Quarter in the Market.	From the Natural Soil. Calculated Produce per Acre. Good Corn.	Off-Corn.	Value of the Sample per Qr. in the Market
	lbs.		qrs. bsh.	qrs. bsh.	
Nitrate of Soda	160	23*s.*	7 4	2 6	27*s.*
Saltpetre	160	34	7 4	— 1	35
Carbonate of Ammonia	160	35	5 5	— 3	—
Muriate of Ammonia	160	35	6 2	— 3	35
Guano	3 cwt.	—	6 2	— 4	35
	bush.				
Kiln-dust	40	32	5 7½	— —	—
Pale Malt-dust	40	35	6 2	— —	—
High-dried do.	40	35	5 5	— —	—
Wood-ashes from Kiln	40	—	5 6	— —	—
	cub yds.				
Red-burnt Earth	80	28	— —	— —	—
Black-burnt do.	80	35	— —	— —	—
Earth without dressing	—	32	5 0	— 4	35

It will be seen from the above that the results were similar, both as regards the bed of brick-clay and upon the field. The sample of the produce from the saltpetre upon the field was superior to any of the others, having less proportion of offal. The produce of the nitrate of soda was very inferior, with an enormous proportion of off-corn; this proves, so far as we can judge from so small an experiment, that it is unfit for Barley on clay-lands. The superior produce from the pale malt-dust, in comparison with high-dried or kiln-dust, justifies the idea that a large proportion of its manuring qualities are carried off by the application of too much heat. The superiority of the produce of black-burnt earth over the red is worthy of notice, as it was undoubtedly upon account of preserving its charcoal; ashes, containing much charcoal, from paring and burning the surface only, are in all cases superior to the red or mere burnt earth, it being destitute of charcoal. If means could be adopted for burning in a temporary furnace covered with a sheet-iron, in the same manner as it is prepared here in making pot-mould, by merely scorching the turf from which a rich compost is made for strong-feeding plants, it would open a new field for the employment of our labouring poor. I am convinced in the common manner of burning, too much heat in the fires is required to allow the charcoal of the plants to be preserved. Considerable caution is necessary in the application of saline manures; the evil effect of nitrate of soda is visible for several years in the working of heavy clays; but saltpetre is less so than the nitrate, as is muriate of ammonia less so even than saltpetre, and it likewise produces a kinder growth than either, being more like pale malt-dust in its effect. I am informed it may be purchased at the wholesale houses at the same price as saltpetre. There is certainly an imitation of Nature in the application of saline manures, or how is it that the fens of Lincolnshire, the hundreds of Essex, the Channel Islands, and the flats of Holland, are so much superior in fertility to soils of the same mechanical texture in the interior of the country at a distance from the sea?—or that animals fatten so much quicker upon the alluvial lands reclaimed from the sea?—or that they pine and die in the interior of America if salt is not often given them?—or that Sea-weed, where it can be procured, is a universally powerful manure? It is not a solitary experiment, either upon a large or small scale, but a multiplicity instituted upon various soils, and in various seasons, the climate, in respect to distance from the sea, altitude, &c., being taken into account, which alone can inform us of the truth in these matters.—*John Rivers, Sawbridgeworth, Herts.*

Tests for Manures.—The season is now approaching when artificial manures will be applied to the land; and I think you cannot render a better service to the Agricultural portion of your readers than by pointing out a mode by which the purity of each kind may be sufficiently ascertained by the farmer for practical purposes. It is a matter of the highest importance to the welfare of Agriculture that the general use of artificial manures applicable by the drill should not be impeded by the frauds which are continually practised by dishonest dealers. I feel persuaded that the produce of the land may be immeasurably increased, and at a much less cost than at present, by the use of the manure-drill and horse-hoe; we need hear no more of worn-out soils; and the cleanliness of cultivation resulting from their use will, if not entirely supersede the necessity for fallowing, at least materially prolong the interval. Farm-yard manure, though undoubtedly containing all the necessary food of plants, also contains the seeds of all pernicious weeds, under circumstances most favourable to their germination. By great expense in preparation, and submitting to great loss of manure in the process of fermentation, such manure may be delivered on the land free from the seeds of weeds, but the cost much exceeds what most people imagine, and what the same degree of fertility may be produced for by means of artificial manures applied by the drill. A very great advantage arising from the use of the latter is, that on heavy land they may be applied at the most favourable moment without the expensive, long, and injurious process of kneading it by the haulage of farm-yard manure in damp weather, thereby producing not unfrequently sterility rather than fertility. I am well aware that the efficiency of artificial manures containing only two elements can only be reasonably calculated upon after an accurate analysis of the soil to which it is proposed to apply them, and that much disappointment has arisen from the want of such caution; but I am anxious that my brother farmers who intend to purchase artificial manures shall have the means of testing by a simple process whether they receive what is proposed to be sent them or something wholly different.—*A Farmer.*

[We have some matter in preparation with reference to this certainly very important subject, and no time will be lost in publishing it. But the task is one of great difficulty and in part insurmountable; for who is to be alive to the ever-varying devices of fraud, where there is a desire to practise it. Moreover, it is not even easy to give plain and simple rules which farmers can employ. We gave formerly a ready and simple test for common salt in nitrate of soda; but we never heard of any one making use of it. So long as farmers will attempt to buy manures *cheaper than they can be made*, frauds will be practised. Dishonest men are always to be found ready to cheat under the pretence of selling cheap, especially when it is so easy to lay the failure of such agents as manures at the door of Chemistry. If a fair price is paid, and only venders of known respectability employed, there will be no fraud.]

Phosphoric Manure.—I have received two or three letters requesting me to state in your Paper the composition of the phosphoric salts used in the experiments upon Turnips. The following is the composition:—The phosphate of potash, soda, and magnesia, weighed about 80 lbs. per bushel, and contained about 50 to 60 per cent. of the pure salts, the residue being sulphate of lime. The phosphate of ammonia was in crystals, and pure. The superphosphate of lime weighed 75 lbs. per bushel, and consisted entirely of superphosphate and sulphate of lime, and no free sulphuric acid. In my experiments on unburnt bones given last week, it is important to remark that the bones were quite pure, reduced by grinding to a powder, and sifted through a muslin sieve. This accounts for the action of sulphuric acid not being so much superior. Repeated experiments with the bone-dust of commerce have satisfied me that on my soil it is quite useless. —*J. B. Lawes.*

Sea-weed as Manure.—I beg to inform your correspondent "M. T.," in reply to his inquiry in your last *Gazette*, that I do not live near enough to the sea to avail myself of the weed as a manure, but I have conversed with farmers who are in the habit of using it, and their account is, that for a single crop it answers well, but that it seems to melt away in the earth. Nevertheless, the repeated use of it must, in the end, materially affect the staple of the soil; for, besides a great multitude of animalcules and small crustacea always entangled in it, a considerable quantity of inorganic substances must be thus accumulated, for it contains potash, soda, sulphur, lime, and magnesia; from this last, indeed, there may be some danger, if carried to excess; for every pint of sea-water contains about 40 grains of magnesian salts, and this earth in large quantities is known to be injurious. The Sea-weed is seldom carted before decomposition has begun, because the quantity of water which it contains when fresh adds so much both to its weight and bulk; and before that process begins it would be useless.—*L. Vernon Harcourt.*

Societies.

AGRICULTURAL SOCIETY OF IRELAND.

At the Council Meeting, on Thursday, January 25th, the Secretary laid on the table the list of Members of the

Society for 1843, and also a copy of a circular letter, to be addressed to the Secretaries of the different local Farming Societies now in connexion with the central one, and amounting to one hundred in number, calling on them to forward the names of such Members as were common to it in common, and also to inform the Council how they proceed to qualify for the Society's premiums this current year, pursuant to the resolution to that effect, which was passed at the last general Meeting of the Society; namely, That each local Society, to entitle it to the premiums of the Central one, should have five of its Members at least, also annual Members of the other Society, or that a sum equivalent to five annual subscriptions of one pound each should be contributed by the Members of the Local body, to the Central Society each year. The Secretary stated, that the beneficial effects of that resolution were already most sensibly felt. Many of the proprietors in the different local societies, from which, hitherto, only one pound, and sometimes no subscription at all, was received, have begun to look up, in order to qualify the local society in time for receiving the premiums of the central body this year. Upon the motion of Mr. William Blacker, it was resolved, that the noble Chairman of the council, the Marquess of Downshire, be requested to communicate with the council of the Royal Agricultural Society of England, and of the Highland Society of Scotland, upon the subject of establishing a uniform system of weights and measures throughout the United Kingdom, for the sale of all agricultural produce. The Secretary having brought forward the voluminous reports upon thorough-draining, from the different proprietors in Ireland, who were competitors for the Societies' gold medal, it was suggested by Mr. Blacker, and agreed to, that the Secretary be directed to write to the different competitors to ascertain from them the beneficial effects that have hitherto arisen from any previous experiments made by them in that department, or from any other experiments in draining, instituted by them previous to those in question. These reports were prepared with the greatest accuracy, and framed as they were from undertakings commenced upon an extensive scale, in different parts of the country, afforded some of the best and most valuable information, not only upon the subject of thorough-draining in general, but also upon the price of labour and other statistical information in various parts of the country. A letter was also read from the Marquess of Downshire, chairman of the council, stating his regret that the city of Kilkenny was not fixed upon for holding the next great annual meeting and cattle show of the Society, and expressing a hope that it was not too late to reconsider the matter. Letters were also read from Professor Kane, inclosing some copies of the paper on the growth and cultivation of Flax, read at a late meeting of the Royal Irish Academy. Letters and reports were also read from the Agricultural Society lately established in Jamaica, seeking for the co-operation and correspondence of the central Society.

Miscellaneous.

Scottish Agricultural Chemistry Association.—The objects of this association have now been fully and positively defined in consequence of the success of the subscriptions necessary for carrying their views into effect; and as its operations are on the very eve of actively commencing, through the instrumentality of their able and distinguished chemist, Professor Johnston, we think it is full time to submit, for the information of our readers, the following statement of the chief objects of the Agricultural Chemistry Association—the duties of the chemist—and the privileges of subscribers:—*Objects of the Association.*—1. The diffusion of existing information, theoretical and practical, by means of occasional verbal expositions, addresses, and correspondence; and 2. The enlargement of our present knowledge, by experimental investigations of practical Agriculturists in the field, and of the Chemist in the laboratory. *Duties of the Chemist.*—The Chemist will be expected to assist in suggesting such series of experiments as are most likely to promote the objects of the association,—to consider and explain theoretically the results obtained—and to point out how they may be best turned to account by the practical farmer. Before commencing the analysis of any substance submitted to him, the chemist may require a statement of the precise object which is proposed to be attained by it. He shall be bound to give only such an analysis as is adapted to the particular practical object for which it is required, and he will apprize the party of the charge to be made for it. The Chemist will have his laboratory in Edinburgh, but during a portion of the year he shall visit different parts of Scotland, on invitations, and at times approved of by the committee. A short journal must be kept by the Chemist of his proceedings, whether in Edinburgh or in the country, a record kept of all the analyses he makes and of any reports he may draw up—all of which, as well as the correspondence on the business of the association, must be patent to the committee of management. All applications for analysis or advice, are to be addressed to the Chemist. *Scale of charges.*—1. Testing saline manures, (such as gypsum, nitrate of soda, sulphate of soda, guano, bone-dust, rape-dust, &c..) for adulterations, for each sample, 5*s*. 2. Examining limestones, marls, shell-sands, &c., to ascertain the proportion of lime, and the presence of magnesia and alumina, 5*s*. 3. Ascertaining the proportion also of the latter, or of any other ingredients, for each ingredient 2*s*. 6*d*. extra. 4. Examining a soil, or the ashes of a plant, to determine the proportion of one ingredient, 5*s*. The proportion of every other ingredient to be charged 2*s*. 6*d*. additional for each. 5. Examining, with a view to its commercial and Agricultural value, any artificial mixed manure (such as manufactured Guano, humus, animalised carbon, patent manures, &c.), 6*s*. 6. Examining the products of vegetation, to determine, for example, the quantity of water, or of starch, or of sugar, in Potatoes or Turnips; or of oil or gluten in wheaten flour, from 2*s*. 6*d*. to 5*s*. 7. Letters asking advice, unless accompanying, and in reference exclusively to substances transmitted for analysis, to inclose 2*s*. 6*d*. 8. No sample to be sent for analysis without the fee being inclosed with it. *Privileges of Subscribers.*—1. Every landed proprietor who pays 1*l*. yearly, and every tenant farming other persons' land, who pays 10*s*. yearly, shall, on subscribing their names, or authorising their names to be inscribed in a book to be kept for that purpose, be entitled to the services of the Chemist on the terms before mentioned. 2. Every 10*s*. subscribed by a tenant, or 20*s*. by a proprietor, will entitle to two analyses yearly on the above terms, and all beyond that number to be charged one-half more. To the numbers of letters of advice, it appears unnecessary at first to prescribe any limits or check beyond the small charge above stated. 3. The Directors of the Highland and Agricultural Society shall be entitled to publish exclusively, in their Transactions, the reports made to the general meetings of the subscribers, as well as such chemical analyses as in the opinion of the committee are deserving of publication. 4. Every Agricultural Society, by paying to the funds of the Association 5*l*. yearly, shall be entitled to one lecture from the Chemist; by paying 10*l*., two lectures; and by paying 15*l*. three lectures;—and such Society shall have the right to prescribe the particular subject of each lecture, as well as to have these lectures delivered either separately or together.—*The Fife Sentinel.*

The Nature of Soils.—"The study of the soils and of the rocks that lie beneath them has led geologists to conclude that the loose materials of which the soil is composed are derived from the solid rocks that lie beneath them—that there was a time when these rocks were everywhere on the surface; but that gradually, by the operation of the rains and other natural causes, these rocks have been worn down and disintegrated, till what had been solid rock became the loose materials which form the soil. These rocks are essentially of three kinds—limestone, sandstone, and clay or slate, the latter in various degrees of hardness; so that if you want to know the kind of soil in any given district, you have only to inquire into the nature of the rocks which form the substratum of that district. But, besides this, the physical examination of the soil tells a good deal of its nature. For instance, if you were to take a quantity of soil of a given weight, and pour water over it in a vessel, then allow a minute or two for the heavy particles to subside, and pour off the water with the lighter particles floating in it into another vessel, and repeat this till all the lighter particles were carried away, then again dry the heavy materials and weigh them a second time—the difference between the first and second weight of the soil would give the amount of the fertilising matter contained in the soil; for all the vegetable or fertilising substances would be carried off in the water, leaving the inorganic and unfertilising substances behind. Exactly the same result would be arrived at by heating a quantity of soil of given weight in an oven or other place—the vegetable matter would be burnt out, and the difference between the first weight and that of the residuum would be the amount of fertilising substances in the soil. These are rude chemical tests, but when you examine the soil by more refined analysis, you discover that there are eleven substances, every one of which are necessary for the growth of vegetation." This the Professor said he would dwell upon more particularly in his next lecture. He then referred to the subsoil and that part of the soil to which the vegetables did not usually penetrate. "Every farmer knows that a few years after he has limed the surface of his fields, the presence of the lime becomes gradually less and less, till it altogether disappears. Now, it happens that this lime is to be found sunk into the subsoil. So it often happens that the very substances of which the upper soil is most deficient are to be found in the subsoil. The cause of this might be easily explained, for when you consider the action of the rains, &c., you see that their tendency is to carry fertilising substances from the surface down to the subsoil. It becomes, therefore, a matter of importance to know whether it would be advisable to bring up the subsoil to the surface and mix the two together. This is not in every case advisable. For instance, here is a section of a soil 18 inches deep, which I have received from a place in Renfrewshire, the surface of which contains a certain quantity of fertilising substances, while the subsoil contains only half the quantity. It is clearly unadvisable, therefore, in this case, to do more than, by draining, to open up the soil, and let the roots of the plant draw from the subsoil that nourishment which it is capable of affording."—*Lecture at Edinburgh on the 10th January by Professor Johnston.*

Wasteful Management of Manure.—Some idea of this may be gained by analogy. Let us imagine that a farmer keeps three teams of horses, who consume, say two quarters of Oats per week. Let the farmer give one quarter each week to the horses, and dispose of the other quarter as follows:—There may possibly be some ruts in the road leading to and from his farm-yard; let him pour as many as possible of the Oats into every one of the horse-holes and ruts of this road, beginning at the gate of the yard, and proceeding to the nearest turnpike-road. There may seem much trouble in all this, but nothing valuable can ever be gained or done without trouble, and this experiment will probably always be conclusive. Some farmyards are nicely drained, and very frequently the drains run into the horse-pond. Let the farmer insist on one of his labourers (who may possibly have some prejudice against it) pouring a good drill of Oats into every drain that leads out of the yard till it arrives at the pond, where he may throw in a bushel or so, and if the drain terminates, as drains sometimes do, on a hard road, let him leave a small heap of Oats in every black puddle. When he shall have done this, let him cause some of the Oats to be scattered in every direction round his stable, and take every possible precaution so that the birds of the air, the mice and rats of the field, the fishes of the ponds, and the creeping things of the earth, may come in for a share of the Oats. The farmer's neighbours may call him mad, but let him not mind this. Ulysses was formerly called mad for sowing salt, but now, many people sow salt who are considered sensible, and even clever. Let the enterprising improver keep perseveringly on with this practice for—say three weeks. On or about this period, the ribs of each of his three teams, when in single harness, will probably form a very respectable representation of a park paling. At this point it is time to pause, and seriously ask himself the question, whether it is wise for a man actually to facilitate the waste and destruction of produce which it has cost him much money to gain, and the economical management of which will produce more money. That which we have imagined it possible for a farmer to do with his horse-food, is not a whit more unwise than the practice of some slovenly farmers with respect to their Manures. What Oats are to his horses,—Manure, and especially the liquid and gaseous portions of Manure, are to his fields. Every atom of earth which comes into contact with his dung, preserves for it some of its fertilising virtues, yet he accumulates it in unpaved yards. Every breath of air that passes over it becomes the vehicle for carrying the volatile gases, in which plants delight, from the farmer's dung-yard to everybody else's field; yet he keeps it for a year uncovered with mould. Every drop of rain which falls from the heavens dissolves some of its most valuable portions, and conveys it into the horse-pond, or some of the neighbouring ditches; yet the good man never dreams of sinking a tank, in order to preserve a substance every pound of which Liebig tells us will suffice to grow a pound of Wheat. Nothing can show more clearly than this national waste, the necessity of men being made acquainted with the laws of Nature, which can never be transgressed with impunity, which combine to ruin every man who regards them not; whilst there is not one law amongst them which, if understood, may not be made the ready and willing instrument of his will.—*Maidstone Gazette.*

Importance of Co-operation between the Farmer and Chemist.—We believe that by far the greatest obstacle to the advancement of scientific Agriculture hitherto, has been the want of co-operation between the farmer and the chemist. Each has tried to move forward alone, and thus each has been led astray. We may not inaptly apply to them the well-known story of the lame and the blind, neither of whom alone could proceed with safety, but when united arm-in-arm, the defects of each were fully compensated for by the superior advantages of the other. Thus the farmer, from his knowledge of practice, is enabled to progress in any given direction, but, from his want of acquaintance with the fundamental principles of his art, may be justly considered blind; whereas the chemist, however clearly he may see the end to be attained, makes but a very lame progression, owing to his ignorance of practice. Let the two but consent to become mutually dependent, and, proceeding arm-in-arm, the assured step of the well-practised farmer will be guided in the right way by the clear-sighted knowledge of the enlightened chemist.—*Dr. Madden, on the Advantages of Extended Chemical Analysis to Agriculture.*

Ewes and Lambs.—A difficulty is sometimes experienced in making ewes own their lambs, and oftener, perhaps, when cases of twin lambs occur than at other times. Those who desire to rear all their lambs may find a benefit in sprinkling a little fine salt over the disowned ones. This will usually attract the mother, and when once the operation of licking has been performed, there is seldom any danger of desertion. A friend assures us he has practised this method with decided success, and no injury to the lambs may be apprehended from the application. Sheep, when about to lamb, should be moved and disturbed as little as possible, as all such disturbances, especially with young or wild ewes, greatly increase the probability of their forsaking their young.—*Ayrshire Agriculturist.*

Preparation of Stiff-land for Turnips.—Every Agriculturist is aware of the difficulty, and, in some seasons, of the almost utter impossibility, of reducing strong adhesive clay soils to a state fit for sowing Turnips. A field on this farm, allotted for Turnips for the present season, is exactly of the description of the soil here referred to, and with the view of surmounting the difficulty experienced in preparing such a soil, Mr. Richardson directed that it should undergo a thorough autumn tillage. It was accordingly ploughed from stubble betwixt the 3d and 7th of October. Betwixt the 10th and 13th of the same month the drills were opened, and farm-yard dung driven from the close, applied to it, at the rate of about 18 tons per Scotch acre, and the whole covered up. In this state it lay till the usual period of sowing in May, when the whole was found to be in a highly pulverised state, equal to the finest garden mould—only covered with a large crop of surface weeds, an article abundantly prolific on this farm. To remove the surface-weeds the drills were lightly harrowed, and a potato-grubber passed between them, and any soil that had thus been brought down was laid up by a double-moulded plough, and the seeds, Purple top Swedes, sown on the 11th of May. The result of this experiment seems clearly to indicate that in a similar way soils of even the most stubborn nature may be prepared for Turnips, and

though it is not pretended that there is anything novel or particular in this mode of tillage, yet as it is not generally practised, it may be of use to keep it before the public. When the crop began to be lifted, a friend suggested the idea of having a part of the field measured and the crop weighed, which was accordingly carefully done, and though this season has generally been considered not the most favourable to the growth of Turnips, yet the result in this case was found to be at the rate of 28 tons 18 cwt. of cleared bulbs per Scotch acre. The same variety of Turnips was grown on another field of this farm, but here the soil was a light loam on a gravelly bottom. This field received an equal quantity of the same sort of manure laid on the stubble, and ploughed in betwixt the 10th and 17th October last, and cross-ploughed and prepared for seed in the last week of April and 1st of May, and sown on the 22d May. A similar space of this field was measured and the crop carefully weighed, giving at the rate of 24 tons 5 cwt. of cleared bulbs per Scotch acre. If the additional produce be the result of the different period of tillage in the former case, and there is no reason to doubt that it is, this is another reason why the practice should be brought into public notice.—*Alexander Ross, Farm Overseer, N. Berwick Abbey.—Kelso Warder.*

Gluten in Grain.—The quantity of gluten in Wheat, Rye, and Barley, is very different; and they contain nitrogen in varying proportions. Even in samples of the same seed the quantity varies; and why? Evidently because one variety has been better fed with its own appropriate fertiliser, than another which has been reared on a soil less accurately adapted by artificial means for its growth. French Wheat contains 12 per cent. of gluten; Bavarian, 24 per cent. Sir H. Davey obtained 19 per cent. from winter, and 24 from summer Wheat; from Sicilian 21, from Barbary Wheat 19 per cent. Such great differences must be owing to some cause; and this we find in the different methods of cultivation. An increase of animal manure gives rise not only to an increase in the number of seeds, but also to a remarkable difference in the proportion of gluten which those seeds contain. Among manures of animal origin there is great diversity. Cow-dung contains but a small proportion of nitrogen. One hundred parts of Wheat, grown on a soil to which this material was applied, afforded only 11 parts of gluten, and 64 of starch; while the same quantity of Wheat, grown on a soil fertilised with human urine, yielded 35 per cent. of gluten, and, of course, a smaller proportion of less valuable ingredients.—*Smith's Productive Farming.*

Notices to Correspondents.

Our Correspondents will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

Agricultural Machines.—*Nemo.*—We shall, in the course of this year, publish a series of articles on this subject in the *Gazette*, which we shall endeavour to make *practically* useful to our readers.

Bone-dust.—*A. H.*—Apply from 2 to 3 qrs. per acre. Bone-dust acts more powerfully on light than on clayey soils.

Buckwheat.—*H.*—Light soil suits this plant; sow it after the rate of 1½ bushel per acre, broadcast, at any time between the beginning of May and Midsummer.

Books.—*J. S.*—Grisenthwaite's "Theory of Agriculture" is a good work on the general subject of Agricultural Chemistry. The article by the late Rev. W. L. Rham, on the "Analysis of Soils," in the 1st vol. of the English Agricultural Society's Journal will teach you how to execute a rough analysis. The "Elements of Chemical Analysis," by E. A. Parnell, Esq., is the most complete work on the subject we know, but it requires a practical knowledge of Chemistry before it can be made use of.

Clover Lea.—*Jack Spratt.*—Sow Italian Rye-grass in the blanks early in March, during wet weather, and rake or harrow it in.

Effect of Winds on Vegetation.—*J. Russell.*—There is no doubt that the shaking and stirring of plants by winds benefits them when it is not too violent, but the cases of fertility in upland districts which you may have noticed, cannot be attributed to this, as they are decidedly exceptions to the general rule. The lateness of the crops at the gateways of fields is owing to the trampling of the land there. If any of the facts on which you base the opinions you allude to have any useful bearing on Agriculture we shall be glad to publish them.

Feed for Young Cattle.—*A Subscriber.*—Your best plan will be to give them 4 lbs. of oil-cake a-piece daily, and Straw *ad lib.* The oil-cake will cost you 1*s.* 9*d.* a week.

Geological Map.—*A Notts Farmer* will find the Geological Map of England, by G. B. Greenough, Esq., sold at the Geological Society's rooms, Somerset House, to be the best published "on a large scale." Maps of particular districts are to be had, but there is no *series* of county geological maps published. This desideratum is being supplied by the maps of the Ordnance Geological survey now proceeding.

Grasses for Cover.—*H.*—Messrs. Lawson and Sons recommend for cover Aira cæspitosa, Arrhenatherum avenaceum, Brachypódium sylváticum, and Bromus giganteus, with some others of less importance. To these we should add more of the coarse Sedges, such as Carex pendula, acuta, paniculata, and lævigata. —*J. L.*

Gorse-crushing Machines.—*J. T. Nicol, M.D.*—See article on Gorse in this and next Numbers of the *Gazette*. We shall take up this subject in the course of our articles on Agricultural Mechanics.

Inorganic Constituents of Onion-tribe.—*T. Price.*—We have not been able to meet with an analysis of the Onion.

Mange.—*Trefoil.*—This is an extremely infectious disease, and consists essentially in the presence of an infinite number of minute insects, invisible to the naked eye, which pierce the skin, and thus produce the well-known irritation. Its cure is effected by totally destroying these insects, which can be done by the application of several drugs: but from the circumstance of the bodies of horses and cattle being covered with hair, and occupying so large an extent of surface, it often happens, that while the infection is removed from nine-tenths of the body, one tenth may continue diseased, and re-infect the whole, or where a number are affected, those convalescent may again receive the complaint, either from those only partially cured, or from contact with the stalls or mangers against which the animals may have previously rubbed. All these liabilities must be guarded against in accomplishing a cure. The animal should be first well washed with soap and water, and when dry, the following application should be thoroughly rubbed in, either with the hand or a brush, over every part of the body. This should be repeated every alternate day two or three times, and then the animal should be again well washed, and examined, and if necessary, the process repeated. Amongst a very numerous class of prophylactics which the writer has employed with success, the old remedy, sulphur, stands first, and the following combination he considers the best:—Sulphur powdered, 1 lb.; white Hellebore, 1 oz., oil of tar, ½ lb.; Linseed Oil, sufficient to make a semi-fluid mixture, or liniment. The mangers, racks, stalls, &c., should be washed from time to time with warm water, and afterwards with a solution of chloride of lime, or whitewash.—*W. C. S.*

Manures.—*A Constant Reader.*—Cover up your minced horse-flesh, a most valuable manure, with plenty of fresh mould, and wait till it has rotted, and then mix it all up together before you apply it to the land. Your fresh-grubbed wood-land is surely full of vegetable matter already. Your best plan is to plant it to Potatoes in spring, and then sow Wheat in autumn. Ammoniacal liquor should not be applied so very long before the land is to be grubbed up. You had better wait till a week or a fortnight before planting the ground. The bones referred to in the Leader, No. 3, *Agricultural Gazette*, were, we believe, boiled bones.

Markets.—*W. R.*—The report of the wool market by Mr. Perrin does not refer to the London market exclusively, but to the general state of the British wool trade. Can you suggest one or two markets for feeding stock the report of which would be *generally* useful?

Nitrate of Soda.—*Omega.*—Scatter it in wet weather broadcast; that will do as well as dissolving it; but whichever way you do, you may apply from 1 cwt. to 2 cwt per acre.

Operation on the Snouts of Pigs.—*F.*—There are two tendons which, with their parent muscles, elevate the snout, and endow it with the power of rooting up the earth. These tendons may be divided about an inch-and-a-half from the nose. A portion of each should be excised, and the wound kept open a while by means of a little tow; a simple division of these would answer no end, as they would soon unite again: but by cutting out a portion, their power would, to a certain extent, be destroyed. The operation is, however, by no means customary in these parts, and I cannot speak from experience of its practical benefit, but am inclined to doubt its superiority to the old practice of ringing.—*W. C. S.*

Potatoes.—*Economist.*—Philipp's Purple will answer your purpose as well as any other. All Potatoes are the better of steaming. The Mangold Wurtzel Potato is very moist, and of bad quality, though it is a large bearer.

Rats.—*Nemo.*—Try smearing their holes, and the passages they frequent, with some arsenical ointment. They are very cleanly animals, and if they rub themselves against any of the greasy ointment, they will lick themselves clean.

Refuse Lime from Gas-works.—*Amicus.*—Make it into a compost with mud, earth, &c., in the proportion of one of the former to six of the latter, and turn frequently so as to expose it as much as possible to the air. Apply at the rate of 12 to 20 cart-loads an acre. The above figures are quite arbitrary; a smaller quantity of earth to mix it with might do equally well. Do not apply it close to the seed or growing-plant.

Salt.—*N. H. Grifton* wishes to be informed whence Mr. Mackenzie has quoted the words printed in a late No., in inverted commas, "salt of the earth."

Sainfoin.—*G. D. V.*—Sainfoin may be sown with a crop, as Clover or Grass. Sow four bushels of it per acre, in the end of March. Barley is the best crop to sow it with. It likes a calcareous rocky soil, and probably would not flourish on a deep sandy loam.

Steeping Seeds.—*T. Price.*—See Leader, No. 4, *Agricultural Gazette.*

Sulphuric Acid and Bones.—*Anonymous.*—Superphosphate of lime is prepared by submitting dry bones to the action of three-fourths their weight of sulphuric acid, which has been previously diluted with its weight of water. It is obtained in the form of a solution, and must be thrown upon dry earth, or sawdust, or something of the kind, in order to carry it to the field. Sulphuric acid is sold at from 1½*d.* to 2*d.* per lb. by wholesale manufacturing chemists. We have written to Mr. Campbell for an answer to your question.

Task-work.—*A Subscriber.*—The dung was measured before turning. 5*s.* or 9*s.* a week, with some cider, a quart or so per diem is the average wage of the labourer in this neighbourhood; but this is of little importance in estimating the proper payment to be made, as may be illustrated by the answer which the story tells us a labourer once made to a farmer, who asked the wages he was willing to be hired at: "Why, master, I've got a shilling stroke, an eighteenpenny stroke, and a two shilling stroke; and you may have just which you've a mind to."

*** As usual, many communications have been received too late for answering this week.

Markets.

SMITHFIELD, Monday, Jan. 29.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	4*s* 10	to 4*s* 2	Best Downs & Half-breds	4*s* 0	to 4*s* 4
Best Short Horns	3 6	3 10	Best Long-wools	3 10	4 2
Second quality Beasts	3 2	3 6	Ewes and second quality	3 4	3 8
Calves	4 6	5 4	Pigs	3 4	4 4

Numbers.—Beasts, 2744; Sheep, 26,170; Calves, 83; Pigs, 270.

The supply continuing moderate, there is a brisk trade to-day, but very little alteration in prices. The best Scots, Herefords, &c. were readily sold at fully last week's prices, but the Short-horns were heavy on hand, barely maintaining our last quotations. In Sheep, the Long-wools were in demand at a slight advance, owing to the continued improvement in coarse wools; other qualities remain about the same. Veal is still dear. Pork is very heavy trade.

Friday, Feb. 2.

Our supply to-day is rather larger than last Friday, and the roughness of the weather has caused a slack attendance of buyers. Beef is a little lower, say 2*d.* per 8 lbs. Mutton is about the same as Monday. Veal is quite as dear; indeed, in some instances the very best have realised 5*s.* 6*d.* per 8 lbs. Pork is a little more in demand.

Numbers.—Beasts, 668; Sheep, 2200; Calves, 134; Pigs, 293.

41, West Smithfield.

POTATOES.—Southwark Waterside, Jan. 29.

Having had during the past week a continuance of fine weather, which has brought the Turnip-tops into the Green Market earlier and more abundant than usual, and consequently arrested the improvement in the demand for Potatoes, though holders of Scotch Reds have increased their pretensions; yet where it was necessary to clear vessels coming on demurrage, no advance whatever could be obtained on last week's price. We have quoted 70*s.* for Perth and Devonshire Reds, as that price has been generally asked, but can only be regarded as nominal.

York Reds		60*s* to 80*s*	Kent and Essex Whites	50*s*	55*s*
Perth		65 70	— — Kidneys	—	65
Early Devons		65 70	Wisbeach Kidneys	—	65
Cornwall		65 70	— Whites and Blues	50	55
Jersey and Guernsey Blues		60 —	Prince Regents	55	65

The supply during the past week has been limited, but these, with former arrivals, have been fully sufficient for the present demand.

SEEDS, Friday, Feb. 2.

Southdown Fleeces	1 0		1	1					

James Pearse, Wool Broker.

MARK LANE, Friday, February 2.—The arrivals of Corn since Monday have been small, which is in some measure attributable to the stormy state of the weather; the few samples of English Wheat fresh up have been disposed of at fully Monday's prices. The inquiry for free Foreign Wheat is limited, but in some instances the finest qualities realise a trifling advance. We have not heard of any transactions in bonded to-day.—Barley meets a steady sale at our quotations.—In Beans and Peas we observe no alteration.—Oats are held firmly by the Factors at late prices, with which the buyers are unwilling to comply.

Kingsford and Lay.

COVENT GARDEN, Feb. 2.—Notwithstanding the great change that has taken place in the weather, the market has been tolerably well supplied during the week, and little alteration has taken place in the Prices of most articles; but trade is not brisk. Fine Apples continue scarce, and have advanced a little in price since our last report; they are rather small, and consist principally of Queens. No hothouse Grapes are now to be found in the market, but Portugals continue sufficient for the demand. The supply of good dessert Pears is rather on the decrease; good specimens of Beurre Rance and Easter Beurré have, however, been brought to the market, and are offered at nearly the same prices as last week. The prices of Apples are also nearly the same as those quoted in our last report. Tangerine Oranges continue to be brought to the market. Lemons are plentiful, and Filberts are sufficient for the demand. Among Vegetables, Cabbages are good and plentiful, Brussels Sprouts and Greens are also abundant; but Broccoli still continues scarce. The supply of Lettuces and Endive is pretty good. Seakale and Rhubarb are sufficient for the demand; Shallots and Onions are good and plentiful. Asparagus is rather scarce. Celery is sufficient to meet the demand, but is rather inferior in quality. Among Cut Flowers we noticed Erica gracilis and hyemalis, Cypripedium insigne, Euphorbia splendens, Lachenalia tricolor, Combretum purpureum, Bignonia venusta, Cinerarias, Acacias, Primulas, Tulips, Hyacinths, and Fuchsias, Pelargoniums and Roses.

FRUITS.

Pine Apple, per lb., 4*s* to 8*s*	Almonds, per peck, 6*s*
Grapes, Portugal, per lb. 1*s* to 2*s* 6*d*	Sweet Almonds, per lb., 2*s* 6*d* to 3*s*

Marshall's Early Scarlet Rhubarbs, 9d. each.			
[illegible]shire Gooseberries, in fine variety, 8s. per doz.			
Cape Currants, 6s. per doz.			

Mixed Grasses for Lawns and Pastures, of the very finest quality.
[illegible] collections of seeds carefully assorted and packed for all climates.
Standard and Dwarf Roses, in fine variety.
Metallic Wire and Labels, Garden Tools, Knives, &c. &c.
Agents for the Sale of Humphreys's Compound.

[illegible] and M'MULLEN beg to thank their Friends for the kind [illegible]ntinuance of their encouraging patronage they have received, and to assure [illegible] their commands shall have careful and prompt attention.
[illegible] Wholesale and Retail Seed Establishment, 6, Leadenhall-street; [illegible]ce, 19, Vine-street, Minories.

JAMES DICKSON & SONS, NURSERY SEEDSMEN and [illegible], in returning their sincere thanks for the liberal [illegible]ge they have hitherto enjoyed from the Nobility, Gentry, [illegible] Public at large, both in this Country, England, and Ireland, [illegible] respectfully to intimate that they have received their Full [illegible]SEEDS, in fine condition, for SPRING SOWING, of [illegible] quality.

From the arrangements they have recently made with some of [illegible] growers, their Customers may depend on receiving [illegible] seeds of all descriptions, carefully selected for J. D. & S.'s [illegible].

J. D. & S. Sons beg to call the attention of their Friends to their [illegible] EVERGREENS, FRUIT and FOREST TREES, in their [illegible] Inverleith and Broughton Park, which will be [illegible] in quality and extent to any in Scotland.

J. D. & S. Sons beg further respectfully to intimate that they [illegible] extended the Floral Branch of their Business; [illegible] assure their numerous Customers and the Public at [illegible] no pains or expense will be spared by which the [illegible] in every department of the concern shall be secured, [illegible] a first-rate article at the lowest figure.

[illegible]es of every article connected with their trade have [illegible] and can be forwarded, per post, on the [illegible] of postage stamps to the amount of sixpence.

[illegible]—Noblemen and Gentlemen provided with experienced [illegible], Land Stewards, and Wood Foresters, whose [illegible] and abilities may be depended on.—32, South Han-[illegible] Street, Edinburgh, January 31, 1844.

SEED TRADE—NO MONOPOLY.

J. G. WAITE, WHOLESALE SEEDSMAN, 1 & 4, Eyre Street-hill, Hatton Garden, London, most respectfully solicits the attention of the Country Trade to his prices of SEEDS recently advertised in the *Chronicle*, and to remind them that everything is quoted very much below the *London Agreed List*. All articles sold at his Establishment are of superior Quality, and genuine Stock-lists to be had on application.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

CHEAP FUEL FOR HOTHOUSES AND STOVES.—Coke, the same as used by the Horticultural Society, to be had in large quantities, at very reduced prices, at the Phœnix Gas Works, Bankside, or Greenwich.

CHARCOAL FOR SALE.—1000 bushels of Charcoal for sale, in quantities of 100 bushels and upwards. Apply to T. H. DARTON, near Hitchin, Herts.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c. &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had detailing the prices, &c.

GUANO.—The Subscribers will bring in a cargo of this MANURE to Berwick-upon-Tweed, in all February and March, direct from Valparaiso.

Haddington, Jan. 22, 1844. BANKS & SON.

Note.—As this will be one of the very few cargoes from the Pacific, whose charterparties will admit of their discharging on this coast, BANKS and SON would recommend intending purchasers to apply for what they may require as early as possible.

POTTER'S GUANO.—Sir Robert Peel, the Earl of Zetland, and others, have used POTTER'S MANURE with the greatest success on almost every kind of crop and soil. Testimonials may be obtained by application, per post, at the Works, 28, Upper Fore-street, Lambeth, or of any of Mr. POTTER'S agents.—See also the Advertisement in this Paper of the 6th Jan., containing some of the Testimonials referred to.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with synopsis of mode of use, on applications to MARK FOTHERGILL, 40, Upper Thames-street, London.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt.

Phosphate of Potash	15s.	per cwt.
,, Soda	12s.	,,
,, Magnesia	9s.	,,
,, Ammonia	1s.	per lb.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported,—Apply to COTESWORTH, POWELL, and PRYOR, London; EDWARDS, DANSON, and Co., Liverpool; or WILLIAM J. MYERS and Co., Liverpool, the Importers.

GENUINE PERUVIAN & BOLIVIAN GUANO ON SALE, BY THE IMPORTERS, ANTONY GIBBS AND SONS, LONDON; GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL. 47, Lime-st., Jan. 31, 1844.

GUANO ON SALE BY THE IMPORTERS, JOHN BOYD & Co., Wellington Chambers, London Bridge, Borough.

LIQUID MANURE.

PUMPS of a Superior Construction, fixed and portable, for Liquid Manure. Garden Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps for Ships, Barges, Tanners, Soap Boilers, Brewers, &c. Well-Digging and Boring executed. BENJAMIN FOWLER (late George Turner), 63, Dorset-street, Fleet-street.

TO AGRICULTURISTS.—IMPORTANT DISCOVERY.

"Quid faciat lætas segetes"—VIRGIL.

THE CORN-PRODUCING LIQUIDS.—"One of the most extraordinary exhibitions in the yard (at the late Agricultural Show, Dundee), was that presented by Mr. JAMES CAMPBELL, of the Dundee public seminaries. It consisted of magnificent plants of Oats and Barley, grown from seed which had undergone a certain chemical preparation, and without the aid of any manure whatever.

"Such a mode of culture is at variance with all practical experience; but Mr. CAMPBELL declares that his prepared seeds, which have produced these strong, healthy plants, were sown by him on land which, to his certain knowledge, had had no manure of any kind for eleven years; and he declared himself quite ready to verify his statement by experiment, and said he was willing, at any time, to impregnate with his chemical preparations the seed which any member of the Society should send to him for that purpose, so as to enable gentlemen to satisfy themselves fully as to the efficacy of this wonderful mode of culture."—*Journal of Agriculture, October*, 1843.

In this discovery is actually realised that boast of science, which some years ago prophetically asserted, that the time would soon come when one might carry in his pocket matter sufficient to manure an acre of land.

After impregnation with these liquids, the seed possesses within itself elements which not only afford additional nourishment to the grain during the progress of germination, but communicate to the expanding vessels of the plant an aptitude to absorb food, both from the soil and the atmosphere.

Of one specimen of Oats exhibited, the average produce of 33 seeds was 1600 grains from each, or a total of 52,800 grains, weighing 48 lbs. per bushel.

The produce of Barley was an average of upwards of 500 grains from each seed sown; and of Wheat sown on 5th July, and taken up on 8th August, to be exhibited, the result was, that while the unprepared seeds gave plants with two, three, and four stems only, the impregnated grain yielded plants with nine, ten, and eleven stems.

The material for these liquids, at the following prices, may be had of the following Agents.

Wheat	material for one gallon		2s. 6d.
Barley	do.	do.	2 0
Oats and Grasses	do.	do.	1 6
Beans and Peas	do.	do.	2 0
Turnip and Rape-seed	do.	do.	2 6

Agents:—Messrs. GEORGE GIBBS & Co., Down-street, Piccadilly, London; JAMES HADEN, Ironmonger, Warminster, Wilts; JOHN CAMPBELL, 5, Mersey-street, Liverpool; E. R. CROUCH, Newcastle-on-Tyne; SAMUEL WALDIE, Carlisle; W. W. FYFE *Agriculturist* Office, Berwick; Messrs. P. LAWSON & SON, Edinburgh; DRYSDALE & Co., Glasgow; DRUMMOND & SON, Stirling; and DICKSON & TURNBULL, Perth.

One-third, or even one-half less grain, is required for seed than is commonly used; and twelve gallons will impregnate eight bushels of grain; for the operation may be repeated in the residual liquid with additional measures of grain, as not more than one-tenth is absorbed in each operation.

Particular printed instructions for using the liquids will accompany invoices. No order under 20 gallons will be supplied.

1, Dudhope-street, Dundee.

MANURE FOR GRASS, &c.—POTTER'S GUANO.

Testimonial of Lord Zetland, Dec. 2, 1842.

POTTER'S GUANO, 2 cwt. per acre, yielded of *Hay*	2 tons	8 cwt.
Peruvian Guano, 2 cwt. per acre, yielded of *Hay*	1 ,,	18 ,,
Difference in favour of Potter's Guano		10 cwt.

BEAUTIFUL FLOWERS. — POTTER'S CONCENTRATED LIQUID GUANO, in quart bottles, 1s. 9d. each, at the principal Chemists and Seedsmen in town and country.

"I used POTTER'S GUANO on my Pansies; they were *much larger* than I ever had them before, and remained in full blow longer than I ever recollect. JOHN RITSON, Sunderland."

"POTTER'S GUANO will convert your desert into a paradise."—Professor LINDLEY, in *Gardeners' Chronicle*, 1843, p. 560.

Works, 28, Upper Fore-street, Lambeth.

For further testimonials see this Paper of the 6th Jan., 1844.

THE URATE of the LONDON MANURE COMPANY, 5*l*. per Ton. It is with the greatest satisfaction after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3ft. 3in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

HEATH-SOIL.—Numerous gentlemen, visitors at Bournemouth, having applied to R. WHITE & Co. for supplies of the fine Heath Peat Soil which abounds in that locality, they beg to inform them that they have now made arrangements to be allowed to remove the same, and can consequently offer it and the White Sand at 10s. 6d. per sugar hogshead, delivered free on board a coasting-vessel here.

Poole Nursery, Feb. 3, 1844.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient "Protective Material" to Plants, and is now in use at the "Royal Horticultural Society's Gardens, Chiswick." It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade.

THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

SUPERIOR SUBSTITUTE FOR TARPAULIN, &c.

C. MACINTOSH & Co. having made a considerable reduction in the price of the Patent India Rubber Covers for Carts, Waggons, Ricks, &c., beg to call the attention of Users of Tarpaulin and Oiled Sheets, to the superiority of their manufacture as an effectual protection against wet, not liable to crack on being folded, and more economical than any other Waterproof cover.—22, York-street, Manchester; and 46 Cheapside, London.

ESSEX AGRICULTURAL PROTECTION SOCIETY.—At a Meeting of the Central Committee, at the Saracen's Head, Chelmsford, on the 20th January, Mr. ROBERT BAKER, Chairman, the following resolutions were agreed to:—

That it is the opinion of this Committee that the great demonstration of feeling on behalf of protection to Agriculture, originating in the Chelmsford Meeting, and since followed up by most of the counties of England, holds forth a reasonable prospect that the great object in view may be accomplished without (at all events in the present stage) recommending the preparation of petitions to Parliament.

That this Committee at present entertain no intention of employing lecturers throughout the county as advocates on its behalf. Chelmsford, Jan. 26, 1844. H. T. BIDDELL, Sec.

SPALDING ASSOCIATION for the PROTECTION of AGRICULTURE.—At a Meeting of the Members of the above Society, and of other parties interested in the Protection of Agriculture, held, pursuant to advertisement, at the Town Hall, Spalding, on Jan. 23, ROBERT EVERARD, Esq., in the Chair, the following Resolutions were unanimously adopted:—

1. Resolved, That it is the bounden duty of all parties in any way dependent upon the prosperity of British Agriculture, to oppose to the utmost the efforts of the Anti-Corn-Law League, engaged as the members of that League are in an unconstitutional conspiracy, adverse alike to the Agricultural interest generally, and to the stability of the most valued institutions of the country.

2. Resolved, That the protection afforded by the present Corn Law is barely sufficient to keep up the progressive improvements in Agriculture, and that if the efforts for extended improvement cease, as must be the case if protection were withdrawn, the increasing population of this country would be dependent for support on the production of foreign countries.

3. Resolved, That the evils of a free trade in Corn are generally considered only through the medium of the low prices which would result from the withdrawal of protection, but this meeting considers that free trade would induce such a superabundant importation of foreign corn that the home-grown produce would not at all times find a market at any price, and that the having to wait for a market for British-grown Corn would, more than any other cause, occasion the poorer tracts of land to be altogether thrown out of cultivation, and the labouring classes employed thereon to lose their only means of support.

4. Resolved therefore, That this Meeting do pledge themselves not only not to give their support to any Government or party which shall, either directly or indirectly, attempt to deprive the Agricultural classes of any portion of the protection afforded by the present Corn-law, but that they will by every constitutional means oppose any proposed diminution of such protection.

5. Resolved, That a Petition to Parliament against any further alteration in the Corn-laws be prepared, and that copies thereof be sent to some influential person in each of the neighbouring parishes for the signatures of the landed proprietors, occupiers, labourers, and other parties dependent upon Agriculture, and that such petitions be transmitted to the Members for this division for presentation in the House of Commons.

6. Resolved also, That it is highly expedient that this Association be extended for the general protection of British Agriculture, and to co-operate with any societies of a similar character, or with any central or general association in this county in opposing the exertions of the Anti-Corn-Law League, and that a subscription be opened to enable such Association to act as the exigency of circumstances may require.

Resolved also, That the above Resolutions be advertised.

ROBERT EVERARD, Chairman.

Mr. Everard having vacated the chair, it was Resolved, that thanks be given to him for his able conduct of the proceedings.

THE DUBLIN UNIVERSITY MAGAZINE, for February, price 2s. 6d., contains:—L'Irlande Apocryphe—The Mishaps of Mister Latitat Nabhum, during a Short Professional Visit to the Sister Island. Chaps. I. to IV.—Life of Gerald Griffin—Stray Leaflets from the German Oak. Fifth Brit—An Ecclesiastical Legislature. No. II. Convocations—Beranger and his Songs. Just published, with 37 Illustrations, price 3s. 6d., cloth,

MRS. LOUDON'S GLIMPSES OF NATURE, and Objects of Interest described, during a Visit to the Isle of Wight. Designed to assist and encourage Young Persons in forming habits of observation.

"We could not recommend a more valuable little volume: it is full of information, conveyed in the most agreeable manner. Our friend, Mr. Loudon, is the Mr. Merton of the story; this adds a melancholy interest to all parts of the work, enriched by his kindly and instructive conversation."—*Literary Gazette.*

"A more fitting present, or one more adapted to stimulate the faculties of 'little people,' could not be published."—*Bath and Cheltenham Gazette.*

London: GRANT and GRIFFITH, successors to JOHN HARRIS, corner of St. Paul's Church-yard.

BOTANICAL & GARDENING WORKS
PRINTED FOR
LONGMAN, BROWN, GREEN, & LONGMANS.

THE THEORY OF HORTICULTURE;
Or, an Attempt to explain the Principal Operations of Gardening upon Physiological Principles.
By JOHN LINDLEY, Ph.D., F.R.S. 8vo. Illustrations on Wood. 12s. cloth.

INTRODUCTION TO BOTANY.
By Prof. J. LINDLEY, Ph. D. F.R.S. Third Edition, with Corrections and considerable Additions. 8vo. Six Plates and numerous Woodcuts, 18s.

A NATURAL SYSTEM OF BOTANY;
Or, a Systematic View of the Organization, Natural Affinities, and Geographical Distribution of the whole Vegetable Kingdom; together with the uses of the most important species in Medicine, the Arts, and Rural or Domestic Economy.
By JOHN LINDLEY, Ph.D., F.R.S. Second Edition, with numerous Additions and Corrections, and a complete List of Genera, with their Synonyms. 8vo. 18s.

SCHOOL BOTANY;
Or, an Explanation of the Characters and Differences of the principal Natural Classes and Orders of Plants belonging to the Flora of Europe, in the Botanical Classification of DE CANDOLLE. For the use of Students preparing for their matriculation examination in the University of London, and applicable to Botanical Study in general.
By JOHN LINDLEY, Ph.D, F.R.S., Fcp. 8vo., with upwards of 160 Woodcuts, 6s.

A SYNOPSIS OF THE BRITISH FLORA,
Arranged according to the Natural Orders.
By Professor JOHN LINDLEY, Ph.D. F.R.S., &c. The Third Edition, with numerous Additions, Corrections, and Improvements, 12mo. 10s. 6d.

GUIDE TO ORCHARD AND KITCHEN GARDEN;
Or, an Account of the most valuable Fruits and Vegetables cultivated in Great Britain: with Kalendars of the Work required in the Orchard and Kitchen Garden during every month in the year.
By GEORGE LINDLEY, C.M.H.S. Edited by Professor LINDLEY. 8vo. 16s.

AN ENCYCLOPÆDIA OF GARDENING;
Presenting in one systematic view, the History and Present State of Gardening in all Countries, and its Theory and Practice in Great Britain. with the Management of the Kitchen Garden, the Flower Garden, Laying out Grounds, &c.
By J. C. LOUDON, F.L.S., &c. New Edition, enlarged and much improved. 8vo. With nearly 1,000 Woodcuts, 2l. 10s.

AN ENCYCLOPÆDIA OF PLANTS;
Including all the Plants which are now found in, or have been introduced into Great Britain; giving their Natural History, accompanied by such descriptions, engraved figures, and elementary details, as may enable a beginner, who is a mere English reader, to discover the name of every Plant which he may find in flower, and acquire all information respecting it. New Edition, with a Supplement.
By J. C. LOUDON; W. H. BAXTER, Jun.; GEORGE DON, F.L.S.; and J. D. C. SOWERBY, F.L.S. 1 vol. 8vo. with nearly 10,000 Woodcuts, 3l. 13s. 6d.

HORTUS BRITANNICUS;
A Catalogue of all the Plants indigenous to, or introduced into Britain. Third Edition, with a NEW SUPPLEMENT, prepared, under the direction of J. C. LOUDON, by W. H. BAXTER, and revised by GEORGE DON, F.L.S. 8vo. 31s. 6d.
The First Supplement, separately, 2s. 6d.; the New Supplement, separately, 8s.

THE ROSE AMATEUR'S GUIDE;
Containing ample Descriptions of all the fine leading varieties of Roses, regularly classed in their respective families; their History, and Mode of Culture. By T. RIVERS, Jun. Third Edition, corrected and improved. Fcp. 8vo. 6s.

THE TREE-LIFTER;
Or, a New Method of Transplanting Trees.
By Colonel GEORGE GREENWOOD. 8vo. with illustrative Plate. Nearly ready.

A SCRIPTURE HERBAL.
With upwards of 120 Wood Engravings. By LADY CALLCOTT. Square crown 8vo. 1l. 5s.

CONVERSATIONS ON BOTANY.
Ninth Edition, improved, fcp. 8vo., with 22 Plates, 7s. 6d.; with the Plates coloured, 12s.

THE PRINCIPLES OF DESCRIPTIVE AND PHYSIOLOGICAL BOTANY.
By J. S. HENSLOW, M.A., F.L.S., &c. Fcp. 8vo. with Vignette Title, and nearly 70 Woodcuts, 6s.

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS.
By CLEMENT HOARE. Third Edition, 8vo. 7s. 6d.

AN INTRODUCTION TO THE STUDY OF BOTANY.
By Sir J. E. SMITH, late President of the Linnean Society. Seventh Edition (1833), corrected; in which the object of Smith's "Grammar of Botany" is combined with that of the "Introduction."
By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., &c. 8vo. 36 Steel Plates, 16s.; with the Plates coloured, 2l. 12s. 6d.

THE ENGLISH FLORA.
By Sir JAMES EDWARD SMITH, M.D. F.R.S., late President of the Linnean Society, &c. 6 vols. 8vo. 3l. 12s.
CONTENTS:
Vols. I. to IV. The FLOWERING PLANTS and the FERNS, 2l. 8s.
Vol. V. Part 1, 12s.—CRYPTOGAMIA; comprising the Mosses, Hepaticæ, Lichens, Characeæ, and Algæ. By Sir W. J. HOOKER.
VOL. V. Part 2, 12s.—The FUNGI—completing the work, by Sir J. W. HOOKER, and the Rev. M. J. BERKELEY, F.L.S., &c.

COMPENDIUM OF THE ENGLISH FLORA.
By Sir J. E. SMITH. Second Edition, with Additions and Corrections by Sir W. J. HOOKER. 12mo. 7s. 6d.
THE SAME IN LATIN. Fifth Edition, 12mo. 7s. 6d.

THE BRITISH FLORA.
In Two Vols. Vol. I.; comprising Phænogamous or Flowering Plants and the Ferns.
By Sir WILLIAM JACKSON HOOKER, K.H. LL.D., F.R.A., and L.S. &c. &c. &c. Fifth Edition, with Additions and Corrections; and 173 Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. 8vo. with 12 Plates, 14s.; with the Plates coloured, 24s.
Vol. II. in Two Parts, comprising the Cryptogamia and Fungi, completing the British Flora, and forming Vol. V., Parts 1 and 2, of Smith's English Flora, 24s.

THE VEGETABLE CULTIVATOR.
Containing a plain and accurate Description of all the different Species of Culinary Vegetables, with the most approved Method of Cultivating them by Natural and Artificial Means, and the best Modes of Cooking them; with a Description of the Physical Herbs in General Use.
By JOHN ROGERS, Author of "The Fruit Cultivator."
Foolscap 8vo. 7s.

LONDON: LONGMAN, BROWN, GREEN & LONGMANS.

BLACK ON BREWING—THIRD EDITION.
On Wednesday, February 14, Third Edition, in 1 vol. 8vo.,
A PRACTICAL TREATISE ON BREWING, based on Chemical and Economical Principles: with Formulæ for Public Brewers and Instructions for Private Families.
By WILLIAM BLACK. Third Edition, revised and corrected, with considerable Additions. The Additions are revised by Professor GRAHAM, of the London University.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

CURTIS'S BOTANICAL MAGAZINE.—Just published, price 3s. 6d. coloured, No. 206 of the NEW SERIES of this interesting and scientific work, edited by Sir William Jackson Hooker. It contains beautifully coloured figures of Cereus Extensus—Dinema Polybulbon—Ipomœa crassipes—Erica Scannoniana—Tetranema Mexicánum—Scaphyglottis violacea. The above work has been published monthly, without any intermission, for the last fifty-eight years, and stands unrivalled by any other botanical publication in beauty and extent. The whole or any part of the work from its commencement may be had of Mr. SAMUEL CURTIS, at the Botanical Magazine Warehouse, Glazewood, near Braintree, Essex.

THE IRISH FARMERS' GAZETTE and HORTICULTURAL JOURNAL. Edited by EDMUND MURPHY, A.B., T.C.D., Landscape Gardener and Improver of Estates, &c.

This Paper was commenced in May, 1843, and having been adapted to the circumstances of Irish Farming—now in a transition-state from the worst to an excellent system—not only points out the best practice, but, giving plain instructions how every operation should be performed, is now recognised as the ORGAN of AGRICULTURAL IMPROVEMENT in IRELAND, where the advantages which have already resulted from it are universally recognised. The result of practices recommended, and of experiments on all subjects connected with the improvement of land, and the increase of its produce, are freely communicated to the Editor and recorded. Selections of the most practically useful articles are made from the various works on farming with which the press now teems, and utterly eschewing politics—so long the bane of the Irish Farmer—and devoting its columns exclusively to Agricultural and Horticultural improvement.

THE FARMERS' GAZETTE has the distinguished honour to be stamped with the approbation of those eminent individuals Wm. Blacker, Esq., James Smith, Esq., of Deanston, and the late Mr. London, and is received with such confidence that the practice of having its contents read at stated periods to assembled farmers is becoming general. The circulation of the IRISH FARMERS' GAZETTE has of late been extending even to England and Scotland, where, up to this period, no effort has been made to bring it under notice, but where the principles of good husbandry being everywhere the same, it is calculated to be equally useful as it has been found to be in Ireland. The most practically useful essays on Farming are, from time to time, struck off for distribution in the shape of TRACTS FOR FARMERS, and have been very extensively circulated, viz.:—On the Dairy; A Catechism of Thorough Draining and Subsoiling; The Culture of Flax; Management of Manure, and Green-Cropping and House-Feeding, are nearly ready. Also, on the 1st Jan. was published, the "Irish Farmers, Gardeners, and Foresters' Almanac."

THE IRISH FARMERS' GAZETTE is published every Friday, at 22, Bachelor's Walk, Dublin, and goes free by post. Annual subscription, 16s., half-yearly, 8s.; payable in advance; and orders directed to the publisher are immediately attended to.

Each volume complete in itself.

CONTENTS of the FOURTH NUMBER for 1844 OF
THE ATHENÆUM,
JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND ART.
Twenty-four Large Quarto Pages, PRICE FOURPENCE,
Or Stamped, to go free by post, 5d.

REVIEWS OF, WITH EXTRACTS FROM—
Westminster Bridge Alterations, by Mr. Barry. Report on the same by Messrs. Walker and Burgess; and Professor Hosking on Bridges.

BETTS'S PATENT BRANDY.—DISTILLERY, No. 7, SMITHFIELD BARS.—Notwithstanding the publicity for many years past given to the superiority of BETTS'S PATENT FRENCH DISTILLED BRANDY over every other Spirit, British or Foreign, it is yet but partially known: J. T. BETTS and Co. therefore feel a duty they owe to the Public and themselves, to invite a comparison between the Patent and the French Brandy, until every Family in the kingdom, in which Brandy is consumed, have made trial of their Patent Brandy,—and, consequently, discontinued the use of the Foreign article. Their respective merits are fairly developed in the following Testimonials, to which they again beg to refer:—

EXTRACTS FROM TESTIMONIALS.

"I do not hesitate to express my conviction that your Patent Brandy is fully as free from everything injurious to health, and contains as pure a spirit as the best varieties of Foreign Brandy. EDWARD TURNER, Professor of Chemistry in the University of London. "John T. Betts, Esq."

"I am bound to say, and do assert it with confidence, that, for purity of spirit, this cannot be surpassed; and that your Patent Brandy is also quite free from those acids which, though minute in quantity, always contaminate the Foreign Spirit. JOSEPH HUME, Chemist to His Majesty. "J. T. Betts, Esq."

"Your Brandy is free from uncombined acid and astringent matter, which exists, more or less, in most of the Brandies imported from France. JOHN THOMAS COOPER, Lecturer on Chemistry. "To Mr. Betts."

It is this perfect freedom from the above objectionable qualities, and its agreeable similarity in flavour to the finest samples of Cognac Brandy, that constitute the peculiar value of the PATENT BRANDY.

J. T. BETTS and Co. are, at length, enabled to give a distinct assurance that arrangements will be completed in the course of the present month, which will afford an unfailing protection to purchasers against the continuance of those frauds, from which they have hitherto so extensively suffered; as each bottle will be secured by a PATENT METALLIC CAPSULE, or covering for the cork, of solid metal, with their name, address, and the words "BETTS'S PATENT BRANDY" embossed upon it; the forgery of which subjects the guilty party to a Penalty of Fifty Pounds for every offence.

This valuable Spirit is manufactured only at the Distillery, No. 7, Smithfield Bars, leading to St. John-street; where it may be obtained, either pale or coloured, in quantities not less than Two Gallons, at 18s. per Gallon, for Cash, on delivery.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet street.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—It. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Hollies-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

ROYAL POLYTECHNIC INSTITUTION.—POPULAR LECTURES daily, abounding in BEAUTIFUL EXPERIMENTS. With the view to amuse the Visitors as well as to afford instruction in CHEMISTRY, EXPERIMENTAL PHILOSOPHY, and other branches of Science, Dr. Ryan, Prof. Bachhoffner, Mr. Goddard, and other Lecturers vary their subjects as much as possible, and have arranged so that each Lecture shall seldom occupy more than half an hour—a List of which for the week is suspended in the Hall of Manufactures. The first commences at a quarter past 12. The Apparatus, &c. used for illustration is of the most elaborate and perfect description, amongst which is Armstrong's HYDRO-ELECTRIC MACHINE which is exhibited daily at 3 o'clock, and at 8 in the evenings, Longbottom's OPAQUE MICROSCOPE, NEW DISSOLVING VIEWS, DIVER and DIVING BELL, &c. &c. Conductor of the Music, T. WALLIS, Mus. Doc. Admission, 1s.; Season's Half price.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1l. 8s. Garden-Lights made and glazed from 1s. per foot, at JAS. WATTS' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

BANKERS.—Union Bank of London.

COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN.—Patrick Fraser, Esq, M.D., No. 62, Guildford-st.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually low rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, remission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

TO EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

Auditors.

H. H. Cannan, Esq. | Robert E. Alison, Esq.

Medical Adviser.—Marshall Hall, M.D., F.R.S., L. and E.

Solicitors.—Messrs. Palmer, France, and Palmer.

THIS IS THE ONLY COMPANY who are bound by their deed of Constitution not to dispute any policy, unless they can prove that it was obtained by fraudulent misrepresentations; and numerous cases have shown how worthless may be a Policy obtained from the most influential office, which is unrestrained by this equitable principle, which removes all anxiety as to future dispute or litigation, and enhances immeasurably the value of the Policies as documents of security.

THIS IS THE ONLY COMPANY who give to the assured on the mutual principle the whole of the mutual accumulations, and also guarantee the sums assured.

THIS IS THE ONLY COMPANY who bind themselves to pay the sums in the Policies, although the debts for which they were effected shall have been liquidated before the claims arise.

THIS IS ALMOST THE ONLY COMPANY who grant in favour of creditors *whole-world Policies*, whereby the debt is secured, although the debtor should go beyond the limits of Europe.

The premiums, calculated according to the Carlisle tables, are lower than usual upon young lives, where participation in the profits is not required; and for short assurances, which at the option of the assured may be continued for life, the rates are as low as a due regard to complete security will permit.

Triennial Ascending Scale to assure £100.

Age	First 3 Years	Second 3 Years.	Third 3 Years.	Fourth 3 Years.	Remainder of Life.
25	£1 2 7	£1 9 9	£1 16 11	£2 4 1	£2 11 3
35	1 9 9	1 19 6	2 9 3	2 19 0	3 8 9
45	2 1 0	2 14 10	3 8 8	4 2 6	4 16 4
55	3 11 1	4 10 9	5 10 5	6 10 1	7 9 9
60	4 8 11	5 17 4	7 5 9	8 14 2	10 3 7

BY THE HALF-PREMIUM PLAN only one-half of the first seven years' premium is required, the other half being payable at the convenience of the assured; thus allowing a Policy to be continued for seven years, at one half of the usual rate, or to be dropped at one-half of the usual sacrifice; and entitling the assured, seven years hence, when loss of health may prevent him from effecting a new assurance, to continue a Policy at a rate of premium applicable to an age seven years younger.

Prospectuses and Schedules are forwarded to applicants, free of expense, by the manager and Agents.

ACTUARY: Peter Hardy, Esq., F.R.S.

Extract from the Report of the Directors of the Society, to a General Meeting of the Members, holden the 17th January, 1844:

"At the end of the six years which have been completed since the 31st of December, 1837, there are in existence in the Society three times as many policies as there were in existence at the end of the year 1837. The capital sums assured under these policies are nearly doubled in amount. The corresponding income derived from annual premiums is also nearly doubled. The accumulated property of the Society is four times as great as it was at the end of that year, and the present divisible surplus is nearly six times as much as that declared in the division of the year 1837."

The Directors invite the public to compare the following Table of the Additions made to the Ten oldest existing Policies in the Society, up to the 31st of December, 1843, with the additions made by other Societies within the same time:—

1834, Policy No.	Sum Assured.	Premium.	Age at Admission.	Total Addition made in 1842.	Increase, 1843.	Total Addition made in 1843.	Amount of Premiums paid.	The total addition is equivalent to the following per centage on the amount of premiums paid.
	£	£ s. d.		£ s. d.	£ s. d.	£ s. d.	£ s. d.

PETER HARDY, Actuary.

DISEASED AND HEALTHY LIVES ASSURED. MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London.—This Office is provided with very accurately-constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families Assured at Equitable Rates.

E. G. P. NEISON, Actuary.

ACHILLES BRITISH AND FOREIGN LIFE ASSURANCE ASSOCIATION, 46, Moorgate-street.

Loans granted to policy holders.

Every description of Life Assurance may be effected upon a moderate scale of Premium, either with or without participation in profits.

Endowments for children or widows, and Immediate or Deferred Annuities granted upon fair and equitable terms.

Loans may be obtained on personal or other security by individuals assuring their lives with this Association.

Risks taken on the Lives of Master Mariners and Passengers by sea, either for the whole term of life or for the voyage.

EDWARD GILBERTSON, Secretary.

Prospectuses and every other information may be obtained by applying at the Offices, 46, Moorgate-street, City.

WARM WINTER WRAPPERS, SHOOTING JACKETS, and SUPERIOR OUTSIDE GARMENTS of all kinds (really waterproof).—An extensive variety of the above, also of BERDOE'S well-known VENTILATING FROCK (in lieu of the Mackintosh) always kept ready—guaranteed to exclude any description or continuance of rain whatever. Those who require really good, efficient, and respectable Garments at the smallest cost possible consistent with TRUE economy, or who wish to avoid disappointment and vexation, will not regret the inspection now confidently invited. Every article made on the premises in the best manner.

W. BERDOE, Tailor, Waterproofer, &c., 69. Cornhill (north side).

ISLEWORTH.

TO BE LET.—A detached House, Pleasure-grounds, and Paddock, in all seven acres, throughout in excellent repair. Unfurnished, for a term of years, from May next. Any Floriculturist will find many advantages in this property, the present proprietor having expended large sums in pursuit of this elegant science. The Orchidaceous-house, Heath, and Stove-house, also the collection of plants therein, if desired, may be taken by valuation.—Apply to LAHEE & SON, 65, New Bond-st.

TERMS FOR THE PERUSAL OF NEW PUBLICATIONS. Now ready, Gratis, and Post Free,

THE TERMS OF SUBSCRIPTION TO THE BRITISH AND FOREIGN LIBRARY, CONDUIT STREET, HANOVER SQUARE.—Families in Town or Country are supplied with all the New and Standard Works for perusal, in any quantity. The New Catalogue is just published, comprising (besides a Large Collection of French and Italian Works) the most esteemed productions in the following branches of English Literature:—

History | Belles Lettres | Voyages and Travels
Biography | Moral Philosophy | Fiction, Poetry
Divinity | Political Philosophy | The Drama.

SAUNDERS and OTLEY, Publishers, Conduit-street.

70, STRAND.

RAMS FOR RAISING WATER WITHOUT LABOUR.

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps.

News of the Week.

HER Majesty opened Parliament on Thursday with a speech from the Throne, longer and more varied in its details than is usual with State documents of this description. The Speech commenced by adverting with satisfaction to the uninterrupted continuance of the general peace, and laid great stress on the cordial understanding established with the Government of France. After alluding to the Chinese treaty and the annexation of Scinde, it passed to the subject of the Estimates, and congratulated the country on the improvement of trade. A brief reference was made to the Bank Charter, and to the necessity of preventing any further accumulation of debt in times of peace. With regard to Ireland, her Majesty announced her resolution to act in strict conformity with the declarations made at the close of the last session relative to the maintenance of the Union, but forbore from observations on the judicial investigations now in progress. Allusion, however, was made to Lord Devon's commission for inquiring into the law of landlord and tenant, and to the propriety of improving the laws affecting the registration of voters, with a view to an extension of the county franchise.—The business of the session was commenced in the Lords by the Earl of Eldon, who moved the adoption of the usual Address. Lord Hill seconded the motion, and after a brief discussion, presenting no particular feature beyond an unwillingness to disturb the unanimity of the House, the Address was carried without a dissenting voice. In the Commons the Address was moved by Lord Clive and seconded by Mr. Cardwell. Amendments were moved by Mr. Hume and Mr. Sharman Crawford; by the former for the purpose of introducing a declaration about the Corn-Laws, and a modification of that passage in the speech which touched upon taxation; and by the latter with the view of stopping the supplies, as a means of redressing grievances. In the debate which ensued, Lord J. Russell condemned the principle avowed by Mr. Crawford, and declared his determination to resist the attempt to stop the supplies by an obstructive minority. Sir R. Peel followed, and in the course of his speech emphatically declared that the Government have never contemplated and do not contemplate any alteration in the existing Corn-Law, and that whenever the Agriculturists demand a fixed duty in preference to the sliding-scale, he was inclined to think that Lord J. Russell would be the party to propose such a measure, and not himself. Mr. Hume's amendments were then negatived by a majority of 186, and Mr. Crawford's by a majority of 256.—Our report of the State Trials in Ireland comes down only to the 15th day, the state of the weather and the snow-storm on Thursday having delayed the mail with the account of that day's proceedings. Mr. Sheil opened the defence on Saturday, and the whole week has been occupied by the addresses of counsel in behalf of their respective clients. Mr. O'Connell is not expected to commence his speech to the jury until Monday, and the examination of witnesses will probably prolong the defence to the end of next week.

The long-protracted debate on the Address in the French Chamber was closed on Saturday by the rejection of all the amendments and the adoption of the Address by a majority of 30. Every effort was used by the Legitimists to induce the Chamber to modify the expressions ap-

plied to the late demonstration in Belgrave-square, but without success; and they at length made a personal attack on M. Guizot on the subject of his memorable journey to Ghent, by which he was changed from the accuser into the accused. For the details of the extraordinary scene which followed and of M. Guizot's defence we must refer the reader to our Foreign News.

Home News.

COURT.—The Queen and Prince Albert accompanied by the Princess Royal arrived at Buckingham Palace on Wednesday afternoon from Windsor Castle. Soon after her arrival, her Majesty held a Privy Council at which the Queen's speech on opening Parliament was arranged and agreed upon. Her Majesty then pricked the list of Sheriffs for the present year. New seals for the settlements on the Gold Coast and the Falkland Islands were examined and adopted, and some reports of the Judicial Committee approved of. At the close of the Privy Council her Majesty gave audience to Sir R. Peel and other Ministers. On Thursday the Queen opened Parliament in person with a speech from the throne which will be found in another part of our Paper; and in the evening of the same day her Majesty accompanied by Prince Albert honoured Drury Lane theatre with her presence.—Viscount Hawarden has succeeded the Earl of Warwick as the Lord in Waiting. Mr. Grimston has succeeded Captain Maynell as the Groom in Waiting, and the Countess of Dunmore has succeeded the Viscountess Canning as the Lady in Waiting on the Queen. Col. Wylde has succeeded Major-General Sir F. Bowyer as Equerry in Waiting on Prince Albert. Her Majesty has presented to Mrs. Holderness, of Horton, a very elegant piece of silver candlestick, highly chased, and bearing her Majesty's initial surmounted with an imperial crown, as a token of the estimation entertained by her Majesty of the loyal and dutiful attention of that lady on the occasion of her recent accident while driving in the neighbourhood of Horton, the particulars of which were given in this Paper at the time.—It is rumoured that negotiations are proceeding on behalf of her Majesty for a mansion in the neighbourhood of Cowes in the Isle of Wight, which it is intended to convert into a marine residence for her Majesty and the Royal family.—It is said that the Duke of Cambridge met with an accident in the beginning of the week while shooting in the grounds of Petworth House, by falling over the stump of a tree, but he fortunately escaped with only a few bruises. His Royal Highness returned to Kew on Wednesday from Goodwood, and was present at the opening of Parliament.

Parliamentary Movements.—It is rumoured that Mr. Marton, one of the Conservative Members for Lancaster, intends shortly to vacate his seat in favour of Mr. Garnett, the late high sheriff of the county. A requisition has been presented to Mr. Sotheron, the Member for Devizes, requesting him to come forward as a candidate for North Wilts, vacant by the death of Sir F. Burdett.

Official Appointments.—Her Majesty has been pleased to appoint the Earl of Stradbroke to be Lord Lieutenant and Custos Rotulorum of Suffolk.

New Sheriffs.—At the Court at Buckingham Palace on Wednesday, the Queen in Council appointed the following Sheriffs for the present year:—*Bedfordshire*, G. J. Sullivan, of Lenigrave, Esq.—*Berks*, E. M. Atkins, of Kingstone Lisle, Esq.—*Bucks*, J. Barnes, of Chorley Wood, Esq.—*Cambridge and Huntingdon*, R. U. Lewin, of March, Esq.—*Cumberland*, G. Harrison, of Lineth-waite, Esq.—*Cheshire*, G. Wilbraham, of Delamere House, Esq.—*Derbyshire*, Sir J. R. Browne Cave, of Stretton-en-le-Fields, Bart.—*Devon*, H. Cartwright, of Forde House, Esq.—*Dorset*, J. Fooks, of West Stafford, Esq.—*Durham*, H. Witham, of Lartington, Esq.—*Essex*, S. Brocket Brocket, of Spainshall, Esq.—*Gloucestershire*, J. Yorke, of Forthampton Court, Esq.—*Herefordshire*, T. G. Symons, of Mynde Park, Esq.—*Herts*, F. Cass, of Little Grove, East Barnet, Esq.—*Kent*, Sir J. H. Hawley, of Leybourne Grange, Bart.—*Leicestershire*, Lord Archibald St. Maur, of Burton on the Wolds.—*Lincolnshire*, The Hon. C. T. Chaplin, of Irnham.—*Monmouthshire*, W. Jones, of Clytha House, Esq.—*Norfolk*, Sir J. P. Boileau, of Ketteringham, Bart.—*Northamptonshire*, Sir H. E. L. Dryden, of Canons Ashby, Bart.—*Northumberland*, E. J. Collingwood, of Chirton House and Lilburn Tower, Esq.—*Nottinghamshire*, C. Paget, of Ruddington, Esq.—*Oxfordshire*, W. Strickland, of Cokethorpe Park, Esq.—*Rutlandshire*, Postponed.—*Shropshire*, J. C. Barton Borough, of Cardwood Park, Esq.—*Somerset*, J. F. Luttrell, of Dunster Castle, Esq.—*Staffordshire*, Ralph Sneyd, of Keel Hall, Esq.—*County of Southampton*, J. T. Washington, of Twyford Lodge, Winchester, Esq.—*Suffolk*, Sir P. Broke, of Nacton, Bart.—*Surrey*, W. Strachan, of Ashurst, Esq.—*Sussex*, E. Hussey, of Scotney Castle, Esq.—*Warwickshire*, Sir F. Shuckburgh, of Shuckburgh, Bart.—*Wilts*, G. E. Eyre, of Warrens, Esq.—*Worcestershire*, J. Richards, of Wassell Grove, Esq.—*Yorkshire*, T. Hutton, of Clifton Castle, Esq. WALES:—*Anglesey*, F. E. Meyrick, of Cefnoch, Esq.—*Brecknockshire*, Llewellyn, of Abercrave, Esq.—*Cardiganshire*, J. P. A. Lloyd Philipps, of Mabus, Esq.—*Carmarthenshire*, R. A. Mansel, of Llanddarog, Esq.—*Carnarvonshire*, J. Price, of Garth-y-Glo, Esq.—*Denbighshire*, H. W. Meredith, of Penrebyrhan Wrexham, Esq.—*Flintshire*, Sir R. Pulston, of Emral, Bart.—*Glamorganshire*, J. Bruce Pryce, of Duffryn, Esq.—*Merionethshire*, D. W. Griffith, of Sygun, Esq.—*Montgomeryshire*, J. Owen, of Brynkinalt, Esq.—*Pembrokeshire*, W. C. A. Phillipps, of St. Bride's Hill, Esq.—*Radnorshire*, D. James, of Presteigne, Esq. In addition to the above, it is announced in last night's *Gazette* that Henry Lewis Stephens, Esq., of Tregenna Castle, has been appointed by the Council of the Prince of Wales, Sheriff of Cornwall for the present year.

The Silver Coinage.—A proclamation will be issued in a few days calling in the old silver coinage of King George III., issued in 1816; George IV., in 1821; and William IV., in 1831; as the greater part of it is so defaced by wear and tear, and so deteriorated in weight, that many of the half-crowns are not worth more than 2s., the shillings 9*d.*, and the sixpences 3*d.* The panic anticipated by the Bank of England in consequence of the proclamation of the 2d October on the light gold currency having subsided, the old silver coinage will be called in without any loss being sustained by the public, as the new coinage will be given in exchange without deduction.

Foreign.

FRANCE.—The twelve days' debate on the separate paragraphs of the Address was closed on Saturday, the whole of the amendments having been rejected; and a vote of the Chamber was taken upon the whole Address, when it was carried in favour of the Cabinet by a majority of 30, the numbers being 220 to 190. The details of the debate prior to this result are extremely interesting. The debate on the paragraph relative to the liberty of education was brought to a conclusion on Thursday, in consequence of a suggestion made by M. Odilon Barrot that all the amendments of which notice had been given should be withdrawn, and that Ministers should be allowed to bring in the measure they had in contemplation, not according to any suggestions from the Chamber, but their own responsibility. This suggestion was received with applause on all sides of the House, and the consequence was that M. de Bouillard, M. de Gasperin, M. St. Priest and others withdrew their amendments, and the paragraph was ultimately adopted. On Friday the Chamber had to decide on the paragraph relative to the Legitimists, and a scene ensued so violent and outrageous that it is likened by some of the papers to the worst period of the first revolution. The Legitimists rose one after the other against the word "branded," tried every plea, from obsequiousness to menace, to prevail on the Chamber not to inflict upon them this word of reprobation. M. Bechart showed that the stigma of the Chamber would fall on such men as him and M. Berryer who sate in the Chamber, whilst it would leave untouched such Legitimists as Chateaubriand, who refused to take any oath of allegiance. It was for the tribunals to punish treason, he said, not for a majority of the Chamber to pass sentence on a hostile minority. Whilst he thus pleaded, a number of voices exclaimed that it was by a proceeding of this kind that the majority of Villele's Chamber had expelled the deputy Manuel. M. Berryer rose afterwards and explained his view of allegiance. The Chamber, he said, had exercised in 1830 the right to change the succession. Of course it preserved that right, and he had taken the oath, like any other member, to be faithful to Louis Philippe's Government until it should please the Chamber to interpret the national sovereignty and will anew. M. Duchatel combatted this theory, by observing that it was not the Chamber who assumed any right in 1830, it was the old dynasty which had broken its oaths, and thus released Chamber and nation from their fidelity. The Marquis de la Rochejacquelin followed, and owned that he had sworn allegiance to the King of the French, an oath which would prevent his conspiring; but it was not one of that devotion and self-sacrifice which he could have made to a Monarch of the old dynasty. M. Guizot rose to press the necessity of the Chamber marking, at least by one expression of blame, its sense of the manifestation of the Legitimists in London. This called up M. Berryer, who complained of the injustice of branding a body of honourable men with political immorality who merely went, when the world was in a state of profound peace, to pay their respects to the Duc de Bordeaux, "thinking, as they did, that the principles which might call that Prince to the throne offered the best guarantees for the future glory of France," and anxious "to talk to him of his country and to tell him how much that country wanted peace." He denied that in doing this they had outstepped their duties as citizens, and he drew a parallel between their conduct and the conduct of their accusers on a previous occasion. "If," said M. Berryer, "we had gone to the entrance into France to give political counsel to a King in the midst of a hostile army." This evident allusion to Ghent produced great confusion. Then pointing to M. Guizot he added, "You glory in it;" and as soon as the tumult would allow, he appealed to the House "if the parallel was not in his favour?" The Minister was thus changed from the accuser into the accused, and found it necessary to defend himself. He immediately mounted the tribune, when a scene ensued such as has not been witnessed for fifty years. For more than an hour M. Guizot stood in the tribune utterly unable to obtain a hearing. "Yes, I have been at Ghent," said M. Guizot; but beyond that the Chamber for an immense time was unable to hear a single word, and at the end of about an hour and half he was still ejaculating "I went to Ghent." "I went to Ghent," he was at last able to say, "to give Louis XVIII. the counsels of those constitutional Royalists who foreseeing his probable return to France"—"What! you foresaw Waterloo?" shrieked one. "Our armies had first to be destroyed," cried another. "Order, order! I invite the Chamber to silence," said the President. "Liberty of speech." "No liberty for treason," were the next cries. "Silence; you shall speak next." "I was fighting," exclaimed another, "for my country at Waterloo, when M. le Ministre was betraying it at Ghent." At length M. Guizot obtained a hearing, and proceeded with wonderful perseverance and courage to face the Chamber, line by line, his bold justification of his life and conduct. He faced it, as even the Opposition papers admit, like a man. He told them that he understood and always had understood them and their prejudices; that he knew perfectly what he was about when he went to Ghent; that nothing better could have been done for France than what he took part in doing; and that as to all their talk "it would never raise him above his disdain." Nothing could surpass the excitement which followed the close of this scene, and the Chamber adjourned in the utmost confusion. On Saturday MM. Cordier and Courtais moved an amendment for leaving out the word "branded." Whilst M. Cordier was supporting this amendment, above fifty members approached the ministerial bench and shook hands with M. Guizot, and M. Berryer himself addressed him with much courtesy. M. Ledru Rollin supported the amendment, and succeeded in imparting some animation to the discussion by comparing the acts of the Restoration with what had been done since 1830. M. de Lamartine then addressed the Chamber for the first time this session, and delivered a conciliatory speech, in which he declared against the strong language adopted in that paragraph, and in favour of one of the proposed amendments, though he had no objection to the sanctity of oaths being proclaimed. After a long debate all the amendments were rejected, and the original paragraph adopted. Upon the division taking place the Marquis de la Rochejacquelin, M. Berryer, the Duc de Valmy, and the other Legitimists resigned their seats in the Chamber. The vote was then taken on the whole address, which was adopted by a majority of 30 in favour of Ministers. All the Royalists had previously retired, and took no part in the division which has ended this protracted and memorable discussion.

SPAIN.—We have accounts from Madrid to the 31st ult. At Saragossa the Captain-General had published a bando disbanding the National Guard of that city, and disturbances were expected to take place. It was said in Madrid that the new Cabinet, in case of a change which was considered inevitable, would be under the leadership of General Narvaez as Prime Minister. General Mazarredo it was thought would go as Captain-General to Cuba, M. Gonzales Bravo as ambassador to the United States, and Colonel Portello would once more be appointed inspector of carabineers. The Archbishops of Seville and Santiago who had been for some time detained at Madrid had been authorised to return to their dioceses. Several of the provinces had voted addresses to Queen Christina urging her to return to Spain.

PORTUGAL.—Accounts from Lisbon of the 25th ult. state that after a discussion of four days the address in reply to the Queen's speech was carried by a large majority. During the debate the Minister of the Interior adverted to the necessity of making some alterations in the tariff and of adopting a mixed system in the mode of levying import duties, applying the *ad valorem* principle to certain articles of foreign manufacture. The question of the negotiations with the court of Rome and the state of the finances were the leading topics of discussion. By a return just published it appears that the consumption of Madeira wine is rapidly increasing in Great Britain. The quantity which paid duty in 1843 was 68,906 gallons against 51,513 in 1842, showing an increase of 17,393 gallons in a year in which the consumption of most other kinds of wine decreased.

GERMANY.—Letters from Dresden of the 20th ult. state that Queen Victoria will go to Germany in the spring, first visiting the Prussian Court. She will arrive at Dresden in the beginning of May and then go to Gotha to visit her father-in-law. So much they say is now decided, but it is possible that her journey may be further extended.—His Majesty the King of Prussia has conferred the Star of the Order of the Red Eagle on Chevalier Bunsen, his Minister and Envoy to this Court. This distinction is the more flattering as it was conferred on the 21st ult., the anniversary of his Majesty's coronation, and at the same time that a similar honour was conferred on another of the most distinguished men of the age, Baron Alexander Humboldt.—The railroad system in Germany is in rapid progress of completion. The line of the north which is already practicable as far as Olmutz, on the Silesian frontier, will next year be opened as far as Prague. The Trieste Railway, which will connect Vienna with the Adriatic and the Italian provinces, has been opened for some time as far as Glocknitz at the foot of the Styrian Alps. The works are now carried on in the vicinity of Gratz, to which capital the railway will be opened next year, and in 1847 the Trieste line will be completed. A railway treaty has also been concluded between the Saxon and Austrian Governments connecting the Prague line with that of Dresden and Leipsic, which has been continued in the other direction beyond Halle. The Ostend and Cologne line being finished the only part of the railway communication between the German Ocean and the Adriatic not completed or in progress, is the line between Cologne and Herse. A few days ago an imperial ordinance appeared for connecting the Trieste railway with that of Venice and Lombardy *viâ* Goritz. This line is rather strategic than commercial, for it insures rapidity of communication with Italy even should the Adriatic forts be blockaded by a hostile power.—About three weeks ago fifty or sixty members of the Baden Diet, now in session at Carlsruhe, all of the ultra-Liberal Party, received through a bookseller, who could not account how the parcel had been forwarded to him, a copy of a pamphlet with the following title:—"Results of the Protocol of the

Ministerial Conference held at Vienna, the 12th June, [illegible]. It was at first suspected that the documents it contained had been fraudulently abstracted from the papers of the late M. de Berg, Minister from Baden at Vienna at the time, and therefore the matter made some stir; but since then several of the distinguished statesmen mentioned as having been present at the conference have officially declared the whole a forgery.

ITALY.—The quarrel between the Court of Sardinia and Rome is said to be in a fair way of a satisfactory adjustment.—The Italian Scientific Association will hold its ninth congress this year at Milan, and the day of meeting is fixed for September 12. Count Boromeo is to be President; M. Piola, the mathematician, C. Bassi, the naturalist, Assessors; and Cesar Cantu, the historian, Secretary-General.—Accounts from Palermo state that the number of deaths occasioned by the burning lava emitted at the late eruption of Mount Etna amounts to 143, and are chiefly foreigners; among whom are many English, who were attracted to the spot by curiosity to witness this phenomenon of nature. The damage done to the fields, vineyards, and cattle is estimated at a million and a half of ducats.

GREECE.—We have received by the Levant packet a summary of the projected constitution of Greece, drawn up by the committee to whom the task was entrusted. The following are the principal articles which were to be brought under discussion forthwith in the National Assembly:—The dominant religion is that of the orthodox church of the East. The Greek church in all spiritual matters and dogmas is united to the Christian Church of Constantinople; in civil matters it is independent and governed by a synod. There is nevertheless freedom in Greece for all religious persuasions. All citizens are equal before the law. Individual liberty is inviolable. The Slave-trade is prohibited. A slave of any nation is free on setting foot on the soil of Greece. There is liberty of the press, and the censorship is not permitted under any pretext. There are three powers: the King, the Senate, and the Chamber of Representatives. The initiative in the passing of laws is in all the three; measures of finance to be first voted by the Chamber of Representatives. The person of the King is inviolable—the Ministers alone are responsible. The King appoints the Ministry, commands the armies, declares war, makes treaties, sanctions and promulgates the laws, and prorogues and dissolves the Chambers. The Crown is hereditary, and passes to the descendants of King Otho, from male to male, to the absolute exclusion of females and their descendants. In default of heirs of King Otho, the Crown descends to his brother Prince Leopold. The King's majority to be fixed at the age of 18 years.

Parliament.

HOUSE OF LORDS.

Thursday.—Parliament was opened this day by the Queen in person with the usual formalities. Her Majesty having arrived at the House of Lords and taken her seat on the throne read the following most gracious Speech:—

THE QUEEN'S SPEECH.

"My Lords and Gentlemen,—It affords me great satisfaction to meet you in Parliament, and to have the opportunity of profiting by your assistance and advice.

"I entertain a confident hope that the general peace so necessary for the happiness and prosperity of all nations will continue unbroken.

"My friendly relations with the King of the French, and the cordial understanding happily established between my Government and that of his Majesty, with the continued assurances of his friendship and amicable dispositions of all Princes and States, confirm me in this expectation.

"I have directed that the Treaty which I have concluded with the Emperor of China shall be laid before you, and I rejoice to believe that it will in its results prove highly advantageous to the commercial interests of my country.

"Throughout the whole course of my negotiations with the Government of China, I have uniformly disclaimed the wish for any exclusive advantages.

"It has been my desire that equal favour should be shown to the industry and commercial enterprise of all nations.

"The hostilities which took place during the past year in China have led to the annexation of a considerable portion of territory to the British possessions in the East.

"The military operations, and especially in the battles of Meanee and Hyderabad, the constancy and valour of the troops, British and European, and the skill and gallantry of their distinguished Commander, have been most conspicuous.

"I have directed that additional information explanatory of the transactions in Scinde shall be forthwith communicated to you.

"Gentlemen of the House of Commons,—The Estimates for the ensuing year will be immediately laid before you.

"They have been prepared with a strict regard to economy, and at the same time with a due consideration of those exigencies of the public service which are connected with the maintenance of our maritime strength, and the multiplied demands for naval and military establishments from the various parts of our widely-extended empire.

"My Lords and Gentlemen,—I congratulate you on the improved condition of several important branches of the trade and manufactures of the country.

"I trust that the increased demand for labour has relieved in a considerable degree many classes of my faithful subjects from severe distress and privations, which at former periods I have had to deplore.

"In several successive years the annual produce of the Revenue, above that of the Public Expenditure. I confidently trust that in the present year the public Income will be amply sufficient to meet all charges upon it.

"I am assured that in considering all matters connected with the financial concerns of the country you will bear in mind the serious evil of accumulating debt during the time of peace, and I am sure you will firmly resolve to uphold that public credit the maintenance of which concerns equally the permanent interests of the Crown and reputation of a great country.

"In the course of the present year the opportunity will occur for renewing the Charter of the Bank of England on the subject of the privileges granted by its charter.

"It will be advisable that during this session of Parliament, and previously to the arrival of the period assigned for the giving of notice, the state of the law with regard to the privileges of the Bank of England and to other banking establishments, should be brought under your consideration.

"At the close of the last session of Parliament I declared to you my firm determination to maintain inviolate the Legislative Union between Great Britain and Ireland.

"I expressed at the same time my earnest desire to co-operate with Parliament in the adoption of all such measures as might tend to improve the social condition of Ireland, and to develope the natural resources of that part of the United Kingdom.

"I am resolved to act in strict conformity with this declaration.

"I forbear from observations on events in Ireland, in respect to which proceedings are pending before the proper legal tribunal.

"My attention has been directed to the state of the law and practice with regard to the occupation of land in Ireland.

"I have deemed it advisable to institute extensive local inquiries into a subject of so much importance, and have appointed a commission with ample authority to conduct the requisite investigation.

"I recommend to your early consideration the enactments at present in force in Ireland concerning the Registration of Voters for Members of Parliament.

"You will probably find that a revision of the law of Registration, taken in conjunction with other causes at present in operation, would produce a material diminution of the number of county voters, and that it may be advisable on that account to consider the state of the law with a view to an extension of the county franchise in Ireland.

"I commit to your deliberate consideration the various important questions of public policy which will necessarily come under your review, with full confidence in your loyalty and wisdom and with an earnest prayer to Almighty God to direct and favour your efforts to promote the welfare of all classes of my people."

The House again met at five o'clock. The Earl of Glasgow, the Marquess of Winchester, and Lord Suffield took the oaths and their seats. Soon after five o'clock the Lord Chancellor entered the House, and read her Majesty's Speech, which was again read by the Clerk at the table.—The Earl of Eldon then moved an address to the Crown for the gracious Speech from the Throne. In doing so he said that it was his good fortune to have nothing but matters of congratulation to touch upon in the few remarks he had to address to the House. In reference to one point noticed in the Speech, he was satisfied there could be but one opinion; he referred to the state of Ireland; he was happy that steps were taken most likely to calm the troubled waters of that country, and that speedy justice would soon be accomplished for Ireland. With the result of certain trials going on there he had nothing to do, but of this he was certain, that their Lordships would assist and co-operate with her Majesty in preserving peace and the legislative union of the two countries, even though extreme means should be deemed necessary for such purposes. He considered that much benefit would be derived from the proceedings of the Landlord and Tenant Commission which had been appointed—he had the fullest confidence in the Commissioners. After alluding to the affairs of the East, the noble Earl referred, in terms of exultation to her Majesty's recent visit to the King of the French, which doubtless was accompanied with much advantage to both countries. After a brief reference to China and Scinde, he touched upon a subject which was not mentioned in the Speech, viz., the Corn-Laws, and begged to express a hope that protection would be still afforded to the agriculturists of this country. With regard to another topic not mentioned in the Speech, he referred to a melancholy circumstance which took place last year by which one Officer fell by the hands of another; he sincerely trusted that some measure would be proposed by Parliament for the prevention, if possible, of such lamentable occurrences. He should not further detain their Lordships, but conclude by moving an Address to her Majesty. The Address was then read; it was, as usual, an echo of the speech from the Throne.

Lord Hill, in a few words, seconded the Address, regretting that he could not congratulate their Lordships on any revival in Agriculture similar to that which had been announced in Manufactures. He was followed by the Marquess of Normanby, Lord Brougham, the Marquess of Clanricarde, Earl Fitzwilliam, and Lord Campbell.—Lord Brougham descanted on a variety of topics, and the state of Ireland was briefly glanced at by the different speakers, but there was a prevailing indisposition to disturb the unanimity of the House, and the Address was agreed to without opposition. The Earl of Shaftesbury was then re-appointed chairman.

Friday.—The House met at half-past 12, when the Bishop of Lichfield read prayers, after which their Lordships waited until nearly 2 o'clock without transacting any business. The Lord Chancellor arrived shortly before 2, when the Peers went in procession to Buckingham Palace, to present the Address agreed to on Thursday night, in answer to her Majesty's Speech on the opening of Parliament. The House then adjourned until Monday.

HOUSE OF COMMONS.

Thursday.—The House met shortly before two o'clock. At 10 minutes past two o'clock the Deputy Usher of the Black Rod summoned the House to the House of Lords to hear the Royal Speech read on the opening of Parliament. The Speaker, accompanied by the members present, immediately proceeded to the House of Lords. On their return the House adjourned. At a quarter before four the Speaker resumed the chair. The attendance of members was rather numerous; there appeared about an equal number on both sides. The following new members took the oaths and their seats:—Mr. Warburton, for the borough of Kendal; Mr. Pattison, for the City of London; Mr. Campbell, for the City of Salisbury; Mr. P. Butler, for the county of Kilkenny; Mr. D. M'Neile, for Argyleshire. On the motion of Sir T. Fremantle, new writs were ordered for North Wilts, in the room of Sir F. Burdett, deceased; and for Devizes, in the room of Mr. Sotheron, who had accepted the Chiltern Hundreds.

The following notices of motion were then given:—by Lord Ashley, on the 8th inst., to move an Address to the Crown relating to the affairs of Scinde; and on the 15th inst. to move for the appointment of a committee to inquire into the system of medical relief in union workhouses; by Lord J. Russell, on the 13th inst., to move for a committee of the whole House to take into its consideration the present state of Ireland; by an hon. Member, on behalf of Mr. Mackinnon, to move on an early day relating to the subject of prison discipline; by Mr. Divett, to move relating to the appointment of Mr. F. R. Bonham to the office of Storekeeper of the Ordnance; by Mr. Milnes, on the 8th inst., to bring forward a motion relating to the Church of England; by Dr. Bowring on the 15th inst. to call the attention of the House to the late commercial treaty with Turkey; by Mr. French, to bring forward a motion relating to the present state of the poor in Ireland; by Sir T. Fremantle, on behalf of Mr. Gladstone, to bring forward a motion, for the 5th inst., relating to the present laws affecting railroads; on behalf of the Home Secretary, on the 8th inst., to bring forward a motion relating to factories; and on behalf of Sir R. Peel, to move on the 8th inst., the thanks of the House to the army in Scinde; by Mr. Wallace, on the 5th inst., to move that all orders and motions on the printed paper be called on and disposed of in the order in which they were printed; and on the 9th, to move for a return of the loss sustained by the public in light sovereigns and half-sovereigns, and the amount of bullion in the Bank.

Sir R. Peel entered the House shortly before five o'clock, and was loudly cheered.

THE ADDRESS.

The Speaker having read her Majesty's Speech on the opening of Parliament, Lord Clive rose and moved, that a humble Address be presented to her Majesty, in answer to the Speech which had just been read. The noble Lord took a review of all the leading facts in the Speech, and expressed his opinion that it must prove satisfactory to the country at large. It was most satisfactory to know that the friendly relations of this country with foreign powers remained unchanged. Her Majesty's recent visit to France would no doubt tend to cement the pacific and friendly feeling which existed between these two great nations. Each succeeding year he hoped would prove the permanency of the peace which had been concluded. The noble Lord then remarked on peace with China, and the successful termination of hostilities in that part of the world, under the able management of Sir H. Pottinger, and after remarking on other subjects contained in the Speech, he moved that a loyal and dutiful address be presented to her Majesty in answer to her most gracious Speech. The noble Lord then read the Address, which was an echo of the Speech.

Mr. Cardwell seconded the Address and was much cheered. The hon. Member congratulated the House on the present aspect of the country. Trade and commerce were improving. There was a surplus revenue and national prosperity was returning. He most cordially seconded the Address.

The Speaker then read the Address at length, after which Mr. Hume rose and complained of the House being called upon to return an answer to the Royal Speech within a few hours after it was delivered. He thought a lapse of 24 hours at all events ought to intervene before it was considered. Some portion of the Speech he agreed with, but others he did not, and therefore time ought to be given fully to consider all the subjects which it alluded to. He believed whilst France and England remained united and acted together, the peace of the world would be maintained. He called on Sir R. Peel no longer to leave the farmers in doubt as to his intentions, reprobated the language used at the Anti-League or agricultural meetings, and proposed two amendments embodying the views which he wished to be added to the address in answer to the Royal speech.—Mr. Sharman Crawford followed with an amendment on the paragraph relating to the estimates, which had for its object the withholding of the supplies until alleged grievances were redressed.—Mr. Fielden seconded this amendment, which was supported by Mr. Warburton and Mr. Wallace.—Lord John Russell said if the amendment meant that a minority might take upon itself to resist the will of the majority in a deliberative assembly and stop the granting of supplies, such a principle could never receive his sanction. It was reasonable to concur in the address, as no one was pledged by it to any approval of the general policy of the Government, and suitable occasions would arise for the discussion of the various topics involved. In regard to the Corn Laws three theories floated in the public mind in relation to them: one insisted on protection to all articles of British industry, a second contended that there should be no tax on commodities but for revenue, and even then not on articles of general consumption, by which the price of the home-grown article would be raised; and a third theory was intermediate, not to abrogate too suddenly that old-established protection which in itself might be disapproved. This latter was the theory adopted by Sir R. Peel; yet, if his corn-law were good for anything, it could only be defended on the old protection principle, which had been given up by Ministers as untenable. This was putting the agriculturists in a false position. Sir R. Peel last year very fairly refused to make any alteration, but reserved to himself the right of judging by the condition of the country the expediency of maintaining it. He should be surprised indeed if Sir Robert were now to declare himself so enamoured of his law as that nothing should induce him to change it.

Sir R. Peel, after hearty commendations of the ability displayed by the mover and seconder of the Address, applied himself to the amendment of Mr. S. Crawford. Even if he approved of the introduction of more of the democratic element into the constitution, he should deprecate the motion. The abuse of privilege was a fatal example, and if those who set it were ever to obtain the government of the country, they would strike at the root of their power. Looking at it in this sense, he thought that Mr. Crawford's good sense would prevail over rash declarations; and that no light use would be attempted to be made of so great an instrument as the power of stopping the supplies. It was expedient not to disturb unanimity in voting the address. He briefly referred to the foreign relations of the country in France and Greece, and after declaring his intention of abstaining at present from discussion on the state of Ireland, he came to the question of the Corn-Laws. Had any alteration been contemplated, it would have been intimated in the Royal Speech. Mr. Hume was therefore quite right in his inference that the absence of all allusion to it was an indication that no change was intended. In a community so complicated as ours it might be exceedingly dangerous to apply, in practice, principles that might be abstractly true. He adhered therefore to a sliding scale in preference to a fixed duty; and if Lord J. Russell advocated a fixed duty on the ground of revenue simply, why not deal with Wheat as with Barley, and raise your revenue at the mill? Last year he refused to make any declaration of general adherence to the law, because such a declaration would be contrary to his duty as a Minister of the Crown. But it was not with any reserve or evasion that he had refused so to declare himself. Ministers had never contemplated and did not now contemplate any change in a law under which prices had maintained a steadiness almost without parallel during the last half-century. The state of the revenue was satisfactory; the balance of income and expenditure had been restored; there was an improvement in most of the great branches of trade; and though there was still distress existing in the country he considered that Ministers had realized the expectations which they had held out, and that they met Parliament under more favourable circumstances than had been witnessed for some years.

Lord Palmerston followed in a short speech, in which he criticized the results of the foreign policy of the Government.—Mr. Roebuck condemned the abstinence from all discussion on the critical state of Ireland, because certain State trials were going on. The blame of the omission he threw chiefly on Lord J. Russell and the Liberal party in the House.—Lord Howick considered that Mr. Roebuck had grossly misrepresented Lord John Russell. On the subject of the Corn Laws he thought that Sir Robert Peel was no friend to the Agriculturist in destroying all chance of the settlement of the question by what was certainly a fair compromise between conflicting interests—a moderate fixed duty. For his part, if he were reduced to the alternative of choosing between the maintenance of the existing law and total repeal, he would have no hesitation in adopting the latter.—Mr. Wyse and the O'Conor Don followed on the subject of Ireland; and Mr. M. Gibson, Mr. Brotherton, and Mr. Villiers, on the present condition of the country and the Corn-law question. Mr. Villiers read passages from an article in the new Number of the "Foreign and Colonial Review," which he understood to have been written by Mr. Gladstone, and in which free-trade principles were freely avowed.—Mr. Gladstone declared that he was not the author of the article; that he did not know who had written it, and that he had never even read a line of it.—Several other Members joined in the debate, amongst whom were Mr. Muntz and Mr. Mark Philips, who warned the House not to be led away by exaggerated notions of returning prosperity.—After some remarks from Mr. Fielden and Mr. Sharman Crawford, the House divided on the amendment, when there appeared—For the amendment, 29; against it, 285; majority, 256.

Mr. Hume's amendment was next put, when there appeared—For the amendment, 49; against it, 235: majority, 186.

The address was then read by the Speaker, when Mr. T. Duncombe gave notice that when the report was brought up he would move an amendment in that passage of her Majesty's speech with respect to certain proceedings now taking place in Ireland, and another amendment to the effect that an extension of the franchise should be applicable to boroughs and cities as well as to counties, in Ireland, as intimated in that passage of the speech recommending a revision of the elective franchise in that kingdom.

Friday.—After the presentation of numerous petitions, and the disposal of several motions for Returns, Mr. S. Wortley asked

whether the policy adopted by Sir Charles Metcalfe in Canada, met with the approbation of the Government.—Lord STANLEY said, the policy and government of Sir C. Metcalfe had met with the full approbation of her Majesty's government. He had, in fact, carried out the intention of her Majesty's government with the greatest success.—Lord J. RUSSELL rose to address the house, and was proceeding to remark on the policy adopted towards Canada, when Mr. ROEBUCK called the noble Lord to order, as there was no question before the house.—Several members asked questions relating to Canada, which Lord Stanley said it was not advisable to answer.—In answer to a question by Mr. Hawes, Sir R. PEEL said, the commercial treaty with the government of Brazil would expire in November next, and then would be the time to consider the subject.—In answer to Sir G. Grey, Sir J. GRAHAM said that the government intended to bring in bills relating to Charitable Trusts and to Ecclesiastical Courts.—Sir R. PEEL asked the hon. member for Exeter what was the nature of his motion respecting the appointment of his friend, Mr. Bonham, to the office of Storekeeper to the Ordnance.—Mr. DIVETT said he was quite ready to make his statement at any time most convenient to the house, and he hoped the transactions of which he had to complain would be satisfactorily explained.—Mr. WALLACE moved that the practice of the House on the presentation of petitions complaining of the grievances of the people be altered, so that in future petitions may be publicly discussed at the time of their presentation; and that any rule or order of this House which controls or prohibits the discussion of the petition of the people at the time of their presentation be rescinded.—Dr. BOWRING seconded the motion.—Sir R. PEEL opposed it. It would be impossible to discuss the thousands of petitions which were every session presented to the House.—Mr. BROTHERTON was anxious that the petitions of the people should be discussed, but he was convinced, on reflection, that the present rule ought not to be departed from.—Mr. WALLACE withdrew his motion.—Sir GEO. CLERK then moved the usual Sessional orders.

CITY.

Money Market, Friday. — **Consols closed at 97 ⅛; Three per Cents. Red., 98 ⅞; Three-and-Half per Cents. Red., 102 ¾; New Three-and-Half per Cents., 102 ¾; Bank Stock, 193; India Stock 276; Exchequer Bills, 67*s.* to 69*s.* prem.**

Metropolis and its Vicinity.

Opening of Parliament.—On Thursday at an early hour crowds were to be seen proceeding from all parts of the metropolis to St. James's Park, and by one o'clock there was a larger assemblage than had ever collected on a similar occasion. The day throughout was most propitious. The streets in the line to the Houses of Parliament and every commanding eminence were thronged, while the balconies and windows of the houses at Whitehall and the government-offices were filled with company. Her Majesty was loudly cheered at differents parts of the route.

Anti-Corn-Law League.—The second weekly meeting of the League was held at Covent Garden Theatre on Thursday evening. The theatre, as on all former meetings, was densely crowded and hundreds were unable to obtain admittance. Mr. George Wilson the chairman presided and several gentlemen addressed the meeting on the usual topics.

The Walbrook Accounts.—At a meeting of the Court of Common Council on Tuesday, Alderman Gibbs requested the attention of his brother magistrates while he offered an explanation of circumstances personally affecting himself, which had recently occupied a considerable share of public attention. As the recent vestry meetings of Walbrook were irregular and illegal he did not choose to give explanations which had it been his pleasure he might have given. He had acted throughout in strict conformity with the duties prescribed for him as a public officer by the rules and regulations of the Ecclesiastical Court to which he was amenable. The charges brought against him of refusing as churchwarden to produce his accounts before persons entitled to demand them was utterly without foundation. The accounts were regularly kept from the commencement of his taking office; and although they were not from time to time audited in a formal manner, they were regularly laid before the vestry who were alone entitled to inspect them. The production of them was a spontaneous and not a compulsory act; but when he found himself assailed by violence and clamour, and by persons who had no right to see them, he was induced to submit to all the obloquy cast upon him rather than submit to illegal dictation, conscious that the day would arrive when his conduct would rise above the suspicions so unworthily cast upon him. The accounts had been audited by the vestry as soon as they were permitted to hold their meeting, and for the whole of the period he had been in office. The accounts had been since printed and extensively circulated in the parish and elsewhere. As to the imputations and insinuations cast upon his management of the pecuniary affairs of the Margate Infirmary, he could truly say that the accounts had been annually printed and circulated, and he was quite sure he need not fear the strictest scrutiny they could undergo. Alderman Copeland said that he had performed an act of duty as a director of the Margate Infirmary in examining the accounts of that institution, and he found that they were correct in every point. The whole of the work had been done by Alderman Gibbs, whom he, as a governor, publicly thanked for the great care and attention which he had bestowed upon the institution, manifesting the deep interest he took in its welfare. With respect to the parish accounts, he found that they had been audited by gentlemen of unquestionable candour and honour, and they were perfectly satisfied with the details. Sir C. Hunter said that his hon. friend had been abominably treated, and he always thought so. The parish accounts reflected the greatest credit upon Alderman Gibbs, and for the zeal and activity he had manifested in conducting the Sea-bathing Infirmary he merited the warmest approbation. Never had a man been more cruelly written down, and how he had the temper to bear such reiterated attacks was matter of the greatest surprise. Sir C. Marshall said he was glad to hear of the result, but he had not read the accounts. He wished to be informed whether it was true that there were arrears owing by the parish to Alderman Gibbs? Alderman Gibbs—Yes. Sir C. Marshall—And for years running on? Alderman Gibbs—Yes. Sir C. Marshall—And can you make the present inhabitants pay these arrears? Alderman Thompson submitted that the question just asked was one of law, which could not be decided in that Court. As a matter of courtesy and justice to Alderman Gibbs the Court had heard his explanation, but it was quite out of order to put questions of the kind just proposed. He rejoiced that the time had arrived when all the obloquy so unjustly and unmercifully cast upon his hon. friend would be removed, and he trusted that the public would do prompt justice to one against whom so many weapons of attack had been levelled. Perhaps some persons would call the conduct of Alderman Gibbs obstinacy. He rejoiced, however, that the public mind must be speedily disabused with respect to his hon. friend, who had acted all through in the office in which he was placed, with honour, zeal, and ability.

New Royal Exchange.—On Tuesday there was a private view of Mr. Westmacott's sculptures intended to adorn the pediment of the new Exchange. The height of the pediment from the spectator is about 56 feet, and the dimensions of the recess are 76 feet in width at the base, by 13 feet at the greatest height. The recess being of sufficient depth to admit of it, the artist has produced his figures in the round, or full figure, instead of alto-relief, which is more frequently used on such occasions. The principal figure in the centre is one allegorical of the genius of commerce, and being the only allegorical figure in the composition, is distinguished from the rest by its superior magnitude, being about 10 feet in height, whilst the others are upon a scale of 7 feet. This principal figure is one of considerable dignity, though severe simplicity. The prow of an ancient vessel, a bee-hive, and a cornucopia, are the accessories which denote its character, with the addition of a parchment scroll, with a seal attached, in the left hand. The groups o f figures on either hand consist of 16 personages—8 on either side—and represent, in appropriate attitudes, the merchants of England, and the various nations with whom their commerce connects them. The Turk, the Armenian, the Greek, the Indian, Hindoo and Mahomedan, on the left of Commerce, are, for the most part, in attitudes of repose and contemplation; on the right, the Persian, the Syrian, the Negro, and further on, a British sailor and a factor are represented, engaged in appropriate occupations. In the extreme recesses left and right are groups of anchors, bales of goods, and other objects connected with navigation and commerce.

East India House.—On Friday a Special General Court of the East India Company was held to take into consideration the conduct of the Government of India towards the Ameers of Scinde. The chairman said that the Board of Control had promised to supply additional papers as soon as Parliament met, and suggested the adjournment of the discussion. It was however agreed that the debate should proceed, and Mr. Sullivan stated the case at great length. At the close of his speech it was resolved that the Court adjourn to Wednesday the 21st inst.

The State of the Streets.—Tuesday being appointed by the commissioners of sewers for the settlement of the question regarding the cleansing the streets of the City, Mr. Gore accompanied by his solicitor was in attendance. Mr. Whitworth the patentee of the machines was also present. Alderman Gibbs the chairman inquired of the inspectors if they had any complaints to make relative to the streets, when they replied in the negative. Mr. Gore and Mr. Whitworth were then called in, when in answer to the chairman, Mr. Gore said he was anxious to come to an arrangement, and had no objection to let the south-west division be cleansed by the machines, with the understanding that he had the sole control of them. This had been objected to by Mr. Whitworth, and the consequence was that no arrangement had taken place. Although he had taken the contract at 4,600*l.*, he was ready to fall back on his former one of 3,400*l.*; but at all events he was determined not to give up the contract until it legally expired. Mr. Whitworth observed that the reason why he wished to have the machines under his own control was that justice had not been done them, and he could not expect it would when they were placed under men who consider the improvement to be an innovation. Mr. Prior thought as Mr. Gore had refused so reasonable a proposition, the commissioners ought to put an end to his contract. He had no doubt of their power to do so on giving seven days' notice. He should be glad to know the opinion of their solicitor on this point, as the question was one of the highest importance and called for prompt interference. Deputy Pewtress moved that the opinion of the solicitor as to the terms of Mr. Gore's agreement should be taken and reported next Tuesday, preparatory to rescinding the contract, in the event of his persisting in his present determination. At the close of the proceedings the patentee remarked, that as the character of his machines had suffered from the manner in which they had been worked in the City, he was most anxious that their capabilities should be fairly tested. Several members of the Court observed that they had come to a determination to have the City better cleansed, and if Mr. Gore persisted in his refusal to allow the proposed experiment by the patentee, the commissioners would cleanse the streets themselves and debit Mr. Gore with the cost.

School of Design.—A report has obtained extensive circulation that the school for the instruction of ladies in drawing and engraving upon wood has been abandoned. It appears that the rumour was justified in part by a suspension of the operations of the school, but that it is by order of the committee again opened. The temporary closing of the school is attributed to the efforts of several wood-engravers who twice memorialized the council, and obtained a hearing by deputation. The deputation insisted that the formation of a school for the education of ladies in the art would materially interfere with the profession of wood-engraving; reducing the income of its followers by an increase of qualified persons; and moreover withdrawing from those who have position and standing the chance of obtaining premiums with pupils, when the necessary knowledge could be acquired at so small a rate as that charged by the School of Design. It was urged on the other side that artists, drawing masters, design draftsmen, and other professions, might with equal propriety advance the same reasons, and if such were entertained that every branch of instruction must be altogether abandoned. The present number of pupils in all branches is about 240.

Public Meetings.—On Wednesday a meeting was held at the Crown and Anchor, to consider the proposal made by Mr. Sharman Crawford and other Members of Parliament, to seek redress of grievances by moving amendments on motions of supply. The meeting was addressed by Mr. Joseph Sturge, Mr. P. A. Taylor, Mr. Duncan and others, and resolutions approving of the proposed measures were adopted. A deputation was then appointed to confer with different members of Parliament on the subject.

Inquests.—An inquest was held by Mr. Wakley a few days since on the body of Dr. George Swiney, M.D., who died at Camden Town, as it was said, from voluntary starvation. Medical witnesses and others were examined who gave a positive denial to this statement, and deposed that deceased was entirely unable to take any food. Three surgeons expressed their astonishment at the extent of internal disease manifested on a post mortem examination, stating that the heart was in a high state of inflammation with scarcely a vestige of muscular fibre remaining, and that it contained more than two pints of fluid. The Coroner remarked that deceased was a man of eccentric habits, but with that the jury had nothing to do. Those who were interested might investigate that elsewhere. Verdict—"Natural death, caused by inflammation and dropsy of the heart." His funeral took place on Monday, and was attended by an immense concourse of spectators attracted by the strange directions of his will, by which he ordered that his coffin should be covered with brown yellow cloth and preceded by three children clad in white. The police had great difficulty in preserving order in the churchyard, and the mass of people was so great that the mourners were obliged to return in hired cabs. Among other things, Dr. Swiney has bequeathed 5000*l.* to the trustees of the British Museum for the establishment of a lectureship on geology, and a similar sum to the Royal Society of Arts, out of which the first freeholder, whether in England, Ireland, or Scotland, that should reclaim and bring into cultivation the largest amount of waste land is to receive 100 guineas, to be presented in a gobletof equal value. This prize gift to be received quinquennially.

Health of Towns.—A meeting was held last week, preparatory to one of a more public character, to consider what steps might be taken in respect to proceedings for putting a stop to the practice of interments in towns. John Dunlop, Esq., of Woolwich, in the chair. Dr. Southwood Smith, Mr. Walker, Mr. Dunlop and other gentlemen having addressed the meeting, subscriptions were opened to defray immediate expenses, and it was determined to prepare petitions for both houses of the Legislature, praying the early abolition of the practice of interments of the dead amidst the living, the formation of national cemeteries, &c., and to invite the concurrence of householders and others.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Jan. 27—West Districts, 144; Northern, 197, Central, 18; Eastern, 266; Southern, 274. Total, 1040. Week's average for the last five years, 946.

Provincial News.

Fires.—On Saturday, a barn on the farm of Mr. Mann of Battisford, near Needham Market, was destroyed by a boy trying his lucifer matches upon the straw in the barn. The cause would have remained unknown, and would no doubt have been set down as malice, but from the circumstance of the boy being caught running away from the spot. On the same day a stack on the premises of Mr. Tabor of Polstead was destroyed. This is the second time the premises have been fired in six weeks. On Thursday a third fire broke out on the premises of Mr. Hall of Eaton Ford, near St. Neots, which destroyed two Barley-barns and other premises. On the same afternoon four cottages were consumed at Colmworth, and there was a fire on the premises of Mr. Tingey of Tempsford. On the same night an attempt was made to fire the farm buildings of E. Reeve, Esq., at Ardleigh Hall, near Colchester, but it was discovered by Mr. Platten of Dedham, who was passing at the time and gave an alarm, when the flames were extinguished without much damage. On Monday one of the old buildings at Glastonbury which belonged to the far-famed abbey of which such splendid ruins remain, was on fire but by prompt means it was saved from destruction. On Saturday a fire broke out in the public buildings at Barnsley, which has almost destroyed the full-length portrait of the Duke of Wellington, and damaged the portrait of Archdeacon Corbett, both of which were painted by Mr. Briggs, R.A. The fire was occasioned by some soot in the chimney catching fire and communicating with the floor. A few nights ago on the farm of Mr. Rayner at Handy Cross near High Wycombe, a large wheat-rick was consumed. On Tuesday three fires broke out almost at the same instant in the parish of Ardleigh near Col-

chester, by which much valuable property on the farms of Mr. D. Cooper, Mr. Vince, and Mr. E. Lugar, was destroyed. On Friday on the farm of Mr. Prime, at Peckleton Folly near Leicester, a dozen stacks were destroyed. On Tuesday on the farm of the Hon. and Rev. H. Tollemache at Harrington, Northamptonshire, some farming property was consumed. On Saturday a large wheat-rick belonging to Mr. Cave, of Lye Court, Brierley, was destroyed. On Thursday some stacks of hay belonging to Mr. Watkins, on the estate of Sir John Smyth, at Aston near Bristol, were destroyed.

Alnwick.—The local papers state that a writ of execution has been directed to the Sheriff of Northumberland to bring to the hammer the celebrated race of cattle so long the exclusive possession of the Earls of Tankerville. The Chillingham wild cattle have long been an object of curiosity to strangers visiting this county, and Sir Walter Scott in his Notes to the "Bride of Lammermoor" has added to the celebrity of this race of Northumbrian cattle.

Aylesbury.—A meeting of between 500 and 600 farmers and others interested in the prosperity of agriculture was held in this town on Saturday. Mr. Edward Horwood of Aston Clinton in the chair. On the platform were Sir Harry Verney and several other landowners. Resolutions in favour of protection having been moved, Sir H. Verney proposed an amendment that petitions should be presented to both Houses of Parliament praying for an investigation into the peculiar burdens that land was subject to. He considered that there was every probability that the protection enjoyed by agriculturists would be taken away, whilst the burdens they were subject to would remain. He conceived that there was great danger of that taking place, and if it did it would be owing to the want of vigilance of those who have been called the farmers' friends. He then spoke in favour of a fixed duty and of long leases; but the amendment was negatived, and the original resolutions adopted by a large majority.

Barton-upon-Humber.—A meeting of the Agriculturists of North Lincolnshire was held in this town on Monday. W. Maw, Esq., in the chair, supported by a large body of freeholders and tenant-farmers. Resolutions were adopted, pledging the meeting to resist the progress of the League, and to raise a fund for the purpose of securing adequate protection to Agriculture. An address to Earl Spencer was also adopted, calling upon his Lordship to resign the Presidency of the Royal Agricultural Society, and declaring that the meeting will not support the Society if his Lordship remains its President.

Blackburn.—A meeting in favour of the League and free trade was held in this town on Monday, Mr. W. Eccles in the chair. Colonel Thompson, Mr. Cobden and Mr. Bright addressed the meeting, and subscriptions to the amount of 713*l.* were entered into on behalf of the League Fund.

Blandford.—On Saturday the Blandford Agricultural Protection Society held their first meeting in this town, Mr. James Burgess in the chair, at which the rules for the government of the Society were arranged and a committee appointed to carry out its objects.

Bletsoe.—A numerous meeting of the tenant-farmers of the northern division of Bedfordshire took place on Friday at Bletsoe, to form an Agricultural Protection Society in opposition to the Anti-Corn-Law League. Among those present were Lord St. John, Mr. Green of Povenham, Mr. Day of St. Neot's, Mr. Higgins of Surrey Abbey, and other landowners. There was a full attendance of tenant-farmers. Mr. J. Paine of Felmersham, who was called to the chair, briefly explained the object of the meeting, and resolutions were adopted enforcing the necessity of protection to Agriculture by means of permanent associations pledged to that object. A subscription was also opened to defray incidental expenses.

Bristol.—The local papers state in reference to the Wills Forgeries which have lately been under investigation at the London Police-offices, that two Bow-street officers have been busily occupied in this city for some time in tracing the particulars connected with these extraordinary transactions. They state also that some parties in Bristol hitherto considered to be of irreproachable character are suspected to be deeply implicated, but the officers have not yet succeeded in capturing them.

Carmarthen.—The *Welchman* states that on Friday-week Mr. Chambers paid another visit to Schoni-Scyborfawr and Daily Cantyr. Their interview took place in the Governor's house and lasted several hours. The previous statements of the prisoners were confirmed by them in every particular, but the confession was necessarily almost a repetition of the former one. Shoni says that the proposition to shoot Mr. Chambers had gained so many supporters in the Pontyberem district, that a fund was actually in the course of being raised to reward the man who would perpetrate the deed. Shoni names several who were willing to commit the murder for 10*l.* This was demurred to by the parties subscribing, and the men who offered to perpetrate the assassination then reduced their demand to 5*l.* Shoni next goes on to state that 2*l.* 10*s.* of this sum was actually raised! The rest was not however forthcoming in consequence of some of the electors of the scheme refusing to go on with it further, and so Mr. Chambers escaped. Shoni it is said states that the rumoured intention of the colliers to undermine the road and blow up the dragoons as they passed along it was founded on truth. An opportunity however did not occur for executing the plan. The convicts have given up the names of a great number of their confederates, and have told the police who will be the most likely men to turn Queen's evidence if promised reward and a pardon. Many respectable farmers are named, and also some publicans and shopkeepers in the neighbourhood of Pontyberem and Llanon. The tale of the payment of those who assisted in the destruction of gates and firing of farms is repeated and insisted on as correct by the convicts, who name a number of the parties who subscribed to pay them for their labour.

Cheltenham.—An inquiry has been instituted by the trustees of the Winchcombe Grammar-school into the charge of cruelty brought against the head-master by the verdict of the Coroner's jury at the inquest on the body of Conrad Algernon Carter, reported in our Paper of the 13th ult. The inquiry occupied three days, and was adjourned until Tuesday, when Lord Sudeley stated at great length the final decision of the trustees. He said they had found that Conrad Carter had been guilty of insubordination on several occasions, and would have been expelled by the committee if such conduct had been repeated; that he had been punished severely by the master, whose only alternative was corporal punishment or expulsion; that such punishment could not in the remotest degree have caused death, and that had the medical witness been examined before the coroner his evidence would have been clear and satisfactory, and the jury would have arrived at a very different conclusion. This verdict of course exonerates the master, who retains his situation.

Croydon.—A meeting of tenant-farmers, landowners and others was held in this town on Saturday, J. W. Sutherland, Esq., in the chair, at which it was resolved to adopt immediate measures for the resistance of the League, and to convene a meeting for the 10th inst., for the purpose of establishing an Agricultural Protection Society for the eastern division of Surrey.

Derby.—On Friday a meeting of the tenant-farmers of South Derbyshire was held in this city. About 400 farmers and landlords were present, among whom were Messrs. Colville, M.P., Mundy, M.P., Edward Chandos-Pole, Reginald Chandos-Pole, C. C. Worsley, the Hon. and Rev. F. Curzon, &c. Mr. Joseph Hassell presided and said as he happened to be merely a tenant-farmer his being in the chair would give a contradiction to the idea the League had laboured to propagate, that the present movement was the work of the landlords. Resolutions were then passed condemning a repeal or further alteration in the Corn-laws, and a committee was appointed with power to add to their number to correspond with other societies formed for a similar purpose, and to adopt such measures as may seem expedient for effectually exposing and arresting the further progress of the League.

Epworth.—A meeting of tenant-farmers was held in this town on Thursday and attended by about 400 persons, at which resolutions condemning the League and declaring protection to be necessary to the Agricultural interests were unanimously adopted. A subscription was also opened for the purpose of aiding the central committee of the county.

Falmouth.—In reference to a paragraph respecting certain Roman Catholic conversions copied by the London papers from the *West of England Conservative*, the Rev. Mr. Lempfried has addressed a letter to the *Times* denying the statement altogether:—"The only ground," he says, "upon which the story could possibly rest is that on Christmas-eve we had a midnight mass, as is usual in many Catholic churches, but which I believe has not occurred at Falmouth perhaps for some centuries. No converts however were admitted on that occasion."

Gainsborough.—A meeting was held in this town on Tuesday "to take into consideration the necessary means to be pursued to support the present arrangement of the Corn-laws." John Skill, Esq., of Normanby presided, and resolutions forming a Protection Society to co-operate with the other Societies in Lincolnshire were adopted.

Grantham.—A meeting of the Kesteven Agricultural Association was held in this town on Saturday, and was attended by about 500 persons, J. C. L. Calcraft, Esq., in the chair. It was resolved to appoint a corresponding committee, to petition Parliament that no reduction may be made in the protection now given by the present Corn-laws, and to open a subscription in aid of Agricultural protection. The meeting was attended by Sir John Trollope, one of the county members; Sir W. E. Welby, Bart.; Mr. Allix, of Willoughby, and several other landowners, and about 600*l.* was subscribed in the room.

Gloucester.—A meeting of tenant-farmers was held on Saturday in this city to adopt measures for the formation of an Anti-League Association. The meeting having been called by private means and not by public advertisement, the attendance was not so numerous as it otherwise might have been. Mr. John Long was called to the chair, and resolutions denouncing the League, affirming the necessity of protection, establishing an Anti-League Association, and appointing a committee, were carried.

Holbeach.—On Thursday week a meeting attended by nearly 300 farmers and other persons interested in Agriculture was held in this town, in order to adopt steps for endeavouring to protect British agriculturists. W. Skelton, Esq., presided, and resolutions in favour of agricultural protection were unanimously carried. Petitions to Parliament embodying these resolutions were then adopted, that to the Lords to be presented by Lord Yarborough, that to the Commons by Sir J. Trollope.

Hull.—Two meetings were held in this town last week to receive a deputation from the Anti-Corn-law League, consisting of Mr. Cobden, M.P., Mr. Bright, M.P., and Colonel Thompson. Sir W. Lowthrop was called to the chair, and opened the proceedings at some length. Mr. Cobden and Colonel Thompson then addressed the meeting. After some disturbance from a person from Newcastle, who wished to challenge "any person in the world" to discuss the Corn-law question with him, the subscriptions were announced, amounting to 305*l.* In the evening a meeting took place in the Victoria Rooms, when about 500 persons, among whom were many ladies, sat down to tea. The Rev. J. Aspinall, rector of Althorpe, Lincolnshire, Mr. Cobden, Mr. Bright and Colonel Thompson severally addressed the meeting. The evening's subscription amounted to 49*l.*, making with that in the morning a total of 354*l.*

Huntingdon.—A meeting of tenant-farmers and agriculturists was held in this town on Saturday, James Rust, Esq., in the chair, at which a Protection Society for Huntingdonshire was formed. A petition to Parliament was also adopted, denouncing the League and praying for a continuance of the laws now in force for the protection of agriculture, the petition to the Lords to be presented by the Earl of Sandwich, and that to the Commons by the county members.

Ipswich.—Pursuant to a requisition addressed to the committee of the East Suffolk Protection Society, a public meeting was held on Tuesday in this town, to take steps to counteract the operations of the Anti-Corn League by the adoption of petitions to Parliament, &c. Mr. Moseley presided, and the meeting was addressed by Archdeacon Berners, Sir Philip Broke, Bart., Mr. Cobbold and other gentlemen, and a petition to Parliament denouncing the League and praying for a continuance of protection was unanimously adopted.

Leicester.—After having been remanded no less than five times since his last apprehension, Mr. Messenger, the master of the murdered labourer, Garner, was once more discharged from gaol on Tuesday, the magistrates being of opinion that the evidence would not warrant his further detention.

Long Sutton.—A meeting of Lincolnshire farmers resident in the neighbourhood was held in this town on Friday, in pursuance of a requisition similar to that which called together the agriculturists of the Holbeach district on the preceding day, for the purpose of concerting measures in opposition to the League. Resolutions were adopted in favour of agricultural protection, and declaring the opinion of the meeting that "the extreme depression in price of all agricultural produce which must be consequent upon the abolition of the Corn-laws would be in the highest degree injurious to the manufacturer, to all tradesmen dependent upon agriculture, and wholly destructive to the agriculturist." A resolution was then agreed to establishing a society for the protection of agriculture, on the same principles as the kindred associations in the other parts of the country.

Maidstone.—A young man named Mepham who was transported about two years since, and has since been proved to be innocent of the offence for which he was convicted, returned to his friends in this town last week, having been provided by Government with a free passage home and an abundant outfit. He gives a detailed account of the hardships and privations endured by all convicts in a penal settlement, and states that he saw the Chartist convicts the day before he received his pardon. Frost was at the Cascade station, about 60 miles from Hobart town, in the bush, and acted as schoolmaster, on which account he was exempt from labour in the forests. Williams broke his leg by a tree falling on him three days before. Jones was employed as a constable to watch the working party in the bush. He told Mepham on the eve of his departure that he would give 10,000*l.* if he had it to change places with him.

Market Harbrough.—A meeting of the Agricultural Society formed on the passing of the Reform Bill for the "Protection of Agriculture" was held in this town on Tuesday, pursuant to a numerously-signed requisition, for the purpose of adopting measures to resist the progress of the League. Mr. Hungerford presided, and was supported by Mr. Stafford O'Brien, M.P., Mr. Halford, M.P., the Hon. W. Wilson, Sir E. Hartopp, Sir A. Harlerigg, and other gentlemen. Resolutions against the League and forming a committee to carry out the objects of the Meeting were unanimously carried.

Newmarket.—A meeting was held in this town on Tuesday, R. D. Fyson, Esq., in the chair, supported by Mr. Eaton, M.P., Mr. Allix, M.P., and numerous landowners and farmers, at which resolutions were adopted in favour of Protection, and condemning the League. A subscription was then entered into, which exceeded 250*l.*

Oakham.—A meeting of the agriculturists of Rutlandshire was held in this town on Monday, attended by the Hon. W. H. Dawnay, M.P., Mr. Heathcote, M.P., Mr. Fludyer the High Sheriff, Mr. O'Brien, M.P., and numerous other landowners and tenant-farmers. Mr. R. Smith of Burley presided. Resolutions were adopted denouncing the League and pledging the meeting to raise subscriptions and form a committee, consisting of a member from each parish in the county, to correspond with other protection societies, and to concentrate a great central association.

Oxford.—The members of the Oxfordshire Agricultural Society and the Agriculturists of the county generally held a meeting on Tuesday "to consider what steps it may be necessary to take to protect the Agriculturists from the designs of the Anti-Corn-Law League, who have openly avowed their determination to endeavour to obtain the repeal of the laws for the protection of Agriculture." The meeting was attended by at least 400 persons, among whom were Mr. Ashurst the president, who took the chair, Mr. Henley, M.P., Mr. Harcourt, M.P., Mr. Blackstone, M.P., Lord Villiers, M.P., Rev. Dr. Ingram, Sir H. Paton, Lord Norreys, M.P., Sir. H. Lambert, Bart., and many other gentlemen. The meeting was addressed by Messrs. Roberts, Gardner, Carpenter, Blake, and Gillett, tenant-farmers, by Col. North, Lord Villiers, Mr. Harcourt, Mr. J. Fane, Mr. Peers, Mr. Blackstone, M.P., Lord Norreys, Mr. Henley, M.P., and other gentlemen. Resolutions were adopted pledging the Asssociation to use all lawful and constitutional means to oppose the designs of the League and to maintain protection for British

Agriculture and other branches of native industry, and a committee was appointed to carry out the objects of the meeting.

Rochford.—A meeting of the Essex Protection Society was held in this town on Thursday week, Mr. R. Baker in the chair, at which resolutions similar to those adopted at Romford on the previous day in favour of the existing corn-laws were unanimously carried. The chairman announced that the total subscriptions in Essex up to the morning of the meeting amounted to nearly 2,400*l.*

Salisbury.—The Agriculturists of South Wilts held a meeting in this city on Saturday, Mr. Hussey, M.P., in the chair, at which resolutions in favour of Protection, which had been adopted at a preliminary meeting, were submitted and unanimously approved.

Sheffield.—In the Leeds district Court of Bankruptcy on Monday last, Mr. Commissioner West gave judgment as to the granting of certificates to Mr. Hugh Parker, Mr. Offley Shore, Mr. John Brewin, and Mr. John Rogers, the partners in the Sheffield Old Bank. The Commissioner went through the principal transactions proved under the fiat, and after stating his belief that they lived as economically as possible, he dwelt particularly on the fact of Mr. Barker having lodged a sum of 750*l.* in the bank for the purpose of being transmitted to Liverpool, but which the bankrupts retained in their possession, and appropriated to their own use on the understanding that they would send it to their London agent. The Commissioner observed that as Mr. Barker kept no account with the bank, it was a single transaction, and therefore, there could be no mistake respecting it. "They were bound," he said, "to transmit that 500*l.* to the house in Liverpool, which they wilfully neglected to do. I am sorry for it, because it in some measure affects the character of all the partners. The most lenient way in which I can view it is, that they intended from time to time to transmit the money to Liverpool. This, however, they did not do, but appropriated it to their own use. Under these circumstances, I think their certificate should be delayed until the 16th of April, and in delaying it until that time I take into consideration the period which has elapsed since the issuing of the fiat."—A meeting was held in this town last week to hear a deputation from the League, Mr. E. Smith in the chair. Mr. Cobden, who had just arrived from Sunderland, Mr. Bright, M.P., and Mr. Ward, M.P., addressed the meeting at great length in favour of total Repeal, and a subscription was entered into which the chairman headed with a contribution of 200*l.*

Steyning.—On Monday a meeting of farmers and others interested in Agriculture was held at Steyning, for the purpose of forming a society to be called the "Sussex Society for the Protection of Agriculture." Among those present were the Dukes of Richmond and Norfolk, the Earls of Egmont, Winterton, Sheffield, Abergavenny, and March, Lord Gage, Sir H. Shiffner, Sir C. M. Burrell, Bart., M.P.; Colonel Wyndham, M.P.; Hon. R. C. Scarlett, M.P.; Mr. Goring, M.P.; Mr. Darby, M.P.; Mr. R. Prime, &c. Mr. J. Ellman of Line, an occupying tenant, was called to the chair and addressed the meeting at great length. The first resolution declared the opinion of the meeting that it is the duty of the owners and occupiers of land to use their best endeavours to counteract the designs of the League. Resolutions in favour of the existing Corn-laws and forming a Protection Society were then carried, the Duke of Richmond being appointed President, and the Earl of Egmont, Lord Gage, the Earl of Sheffield, Sir C. Burrell, and Colonel Wyndham, Vice-Presidents. The Duke of Richmond then addressed the meeting at great length, and said he had felt it his duty as a landlord to attend the meeting, and to co-operate with them to the utmost of his power in the promotion of every object beneficial to agriculture. A subscription was afterwards opened, when upwards of 1000*l.* was at once subscribed; the Duke of Richmond, the Duke of Norfolk, the Earl of Egmont, Sir C. Burrell, the county members and other gentlemen putting down their names for 100*l.* each.

Stockport.—The colliers employed at Lord Vernon's collieries at Poynton, Worth, and Norbury, near this town, turned out for an advance of wages on Saturday week. For some weeks past a spirit of dissatisfaction had been exhibited among them, and considerably less coal than usual had been got, so that the "banks" were empty. In consequence of this proceeding several cotton-mills in Stockport were obliged to stop for coals last week.—A meeting in favour of the League was held in this town on Tuesday which was attended by nearly 3,000 persons. Mr. Cobden and Mr. Moore addressed the meeting as a deputation from the League, and the sum of 1,013*l.* was subscribed exclusive of 300*l.* at Manchester.

Tamworth.—On Monday a meeting of the members of the Tamworth Agricultural Association was held in this town, when measures of resistance to the movements of the League were adopted. Mr. H. J. Pye, a large landed proprietor, and formerly High Sheriff for Stafford, occupied the chair, and amongst the gentlemen present were Mr. Woolfersten, of Stotford Hall; Mr. Tongue, of Comberford Hall; Major Bamford, Mr. Bourne of Fisherwick, and other influential agriculturists.

Taunton.—Sir Thomas Lethbridge has addressed a letter to the landowners, &c. of West Somerset, calling upon them to get a county meeting, to express their sentiments on the Corn-laws and the proceedings of the League, He says, "My opinions have been long known; they are still the same—that the present Corn-law is bad, and ought to be replaced by open ports with fixed duties; and this was the measure the last Government intended to give us when they were turned out, and the sliding-scale soon after was established. If the open-port system had been then carried, there would have been no League at work now, and all parties would have been satisfied, and Corn would have come in regularly, and some perhaps gone out as regularly, and a regular duty would have acted for revenue and for protection; but unhappily for the country at that time you all, or nearly all, stood by with folded arms, and trusted to those whom you thought friends, and you are now tasting the bitter fruits of your then neglected duties."—An investigation has been made by the magistrates of Kingston near this town and by one of the county coroners respecting the death of an old man named William Sealey, who died in April, 1842, of what was then supposed to be inflammation of the stomach and bowels, but who, from circumstances which have since transpired, is believed to have been poisoned by his own daughters, by the administration of arsenic in large doses. One of these women Mary Sealey was recently committed for trial for the wilful murder of her great aunt Betty Sealey, perpetrated under circumstances of singular atrocity. Circumstances which have come to light in consequence of her committal have led to the suspicion that her father also died by her hand. He was a day-labourer, and about 50 years of age at the time of his death. He lived with his daughters, Mary and Faith, and two of his sons, at a hamlet called Pickney, about a mile or two from Taunton. He had often been heard to have quarrels with his daughters, but no suspicion arose at the time that his death was caused by violent means. The body has now, however, been exhumed and analysed by Mr. Herapath of Bristol. At the close of the evidence the jury returned a verdict of Wilful Murder against both the daughters.

Wakefield.—On Wednesday a public dinner in favour of Free Trade and the abolition of the Corn-laws took place in this town, and was attended by upwards of 600 persons from all parts of the West Riding. Mr. J. G. Marshall presided. The event of the meeting was the speech of Lord Morpeth in favour of free trade, in which his Lordship expressed his conviction that a change in the present corn-laws is inevitable, and that the progress of free-trade principles can no longer be delayed. "I know not," he said, "what new forms of tactics the enemy may assume. Farmers may secede from useful agricultural societies; the Anti-League may be rallying up to scatter the light chaff of your arguments with the heavy flail of their logic; you may be accused of setting fire to ricks, or, resorting to another element, they may threaten you with submersion in rivers; but you will look upon all these ebullitions of hostility as evidences and omens that you are gaining ground, that you are making way, that you are making yourselves felt." The meeting was afterwards addressed by Mr. Hamer Stansfield, Mr. Cobden, Mr. Bright, Col. Thompson, and other gentlemen.

Whitburn.—The landowners and farmers of this neighbourhood held a meeting on Monday, when a petition was agreed upon to be presented to both Houses of Parliament, praying "that adequate protection should be continued to the British cultivator, and that in any changes the Legislature might think fit to adopt in the existing Corn Laws the protection now enjoyed by them should not be diminished."

Worcester.—A meeting of the Worcestershire Agricultural Protection Society was held in this city on Saturday, P.V. Onslow, Esq., in the chair, supported by Sir A. Lechmere, Bart., Mr. Pakington, M.P., Mr. G. C. Vernon, Gen. Lygon, and numerous other landowners and agriculturists. Resolutions against the League and in favour of protection were unanimously adopted, and a committee appointed to open a communication with the Protection Society of Essex, as the county which first set the example of this defensive movement, with a view of suggesting a combined operation of the Protection Societies of England.

York.—A meeting to receive a deputation from the League was held in this city on Thursday, Mr. E. Smith of Sheffield in the chair. About 1500 persons were present, and the chairman, Mr. Cobden, Mr. Bright, and Col. Thompson addressed the meeting. At the close of the proceedings subscriptions to the amount of 115*l.* were announced.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1270*l.*; Birmingham and Gloucester, 1573*l.*; Eastern Counties, 3522*l.*; Edinburgh and Glasgow, 1,796*l.*; Great Western, 11,590*l.*; Grand Junction, 6438*l.*; Glasgow, Paisley, and Ayr, 1122*l.*; Great North of England, 1378*l.*; London and Birmingham, 13,630*l.*; South Western, 4569*l.*; Blackwall, 590*l.*; Greenwich, 718*l.*; Brighton, 2804*l.*; Croydon, 205*l.*; Liverpool and Manchester, 4122*l.*; Manchester Leeds, and Hull, associated, 5251*l.*; Midland Counties, 2399*l.*; Manchester and Birmingham, 2541*l.*; North Midland, 3791*l.*; Newcastle and Carlisle, 1272*l.*; South-Eastern and Dover, 2186*l.*; Sheffield and Manchester, 467*l.*; York and North Midland, 1394*l.*—The half-yearly meeting of the Liverpool and Manchester Company was held last week in Liverpool. It appeared from the report that the receipts for the half-year had amounted to 121,031*l.* 4*s.* 6*d.*, the disbursements to 57,642*l.* 10*s.* 2*d.*, leaving a net profit of 63,388*l.* 14*s.* 4*d.*, out of which the Directors recommended a dividend of 5*l.* per 100*l.* per share, which on 12,090 shares would amount to 60,450*l.*, and leave a balance of 2938*l.* 14*s.* 4*d.* to be carried to the next account. The Directors were then authorised to carry into effect a proposed arrangement with the Manchester, Bolton, and Bury Company. The dividend of five per cent. was ordered to be made.—The half-yearly meeting of the Greenwich Company was held on Tuesday. The report stated that the Directors in accordance with the resolution of the 31st August last had notified to the Croydon and Dover Companies, that the Directors would be ready to charge reduced rates of tolls, viz.:—4*d.*, 3*d.*, and 2*d.*, for first, second, and third class passengers, to commence whenever those companies would bring all classes of passengers at moderate fares to London bridge, and that the offer was declined by both Companies. The report referred to the proceedings of the Company with reference to an exchange of stations, &c. and stating that the Directors had been enabled to open on the 16th inst. the south side of the approach to the terminus from London-bridge. In August last a scale of reduced fares to Greenwich was adopted, which showed an increase of 151,943 passengers, but a decrease of 966*l.* 4*s.* 8*d.* in the receipts. From the statement of accounts for the half-year it appeared that after paying all expenses, together with interest on mortgage-debt and on the preference shares, as well as appropriating 1000*l.* as before towards the expense of relaying the line, there remained on the profit and loss account a balance of 416*l.* 18*s.* 6½*d.* It having been moved and seconded that the report be received and adopted, a long and angry discussion ensued with reference to some former minutes which however were finally confirmed. It was next resolved that legal opinion should be taken respecting the preference shares, on the point whether the Directors are warranted in paying dividends to the preference shareholders before all the expenses of working and repairing the line are discharged, and whether the preference shareholders are entitled to any arrears of dividend which are existing beyond the past half-year. From the small amount of the balance no dividend was declared.—A meeting was held at Truro on Friday at which most of the large and influential capitalists and landed proprietors attended, to receive a report from a committee of gentlemen appointed at a former county meeting on the subject of a railway through Cornwall. The Earl of Falmouth presided on the occasion, and Sir Charles Lemon, Bart., Mr. Pendarves, M.P., Mr. Turner, M.P., Mr. Gregor and Mr. Treffry, with some others of the provisional committee, addressed the meeting. The report was received and the propriety of encouraging the railway was unanimously admitted.—A private opening of the South-Eastern Line took place on Saturday. The Directors and Engineers passed over the line four times at the rate of about 20 miles an hour and expressed themselves satisfied with the experimental trip.—A meeting of the shareholders of the West London Railway took place last week for the purpose of considering the expediency of extending the line to the Thames, with the view of affording similar facilities to the Great Western and Birmingham Railways as those enjoyed by the South Western. The estimated cost of the extension as laid down by Mr. Stephenson, including the land as valued by the company's surveyor, is 60,000*l.*, and it is proposed to raise a new capital of 64,000*l.*, divided into 3200 shares of 20*l.* each, to be denominated "extension shares," with the following advantages and priority of dividend. The deposit is to be 2*l.* per share, with subsequent calls not exceeding 3*l.* per share every three months, interest at 5*l.* per cent. per annum to be payable half-yearly on the deposit and calls until the completion of the railway. From the time of completion it is proposed that, as the capital to be subscribed will on its application in the manner proposed add considerably to the revenue of the company, and as it is intended that the shares be issued at par, the holder is to be entitled to a fixed annual dividend of 10*s.* per share, payable half-yearly in priority to all other dividends, and also to participate equally in every respect, both in preference and contingency, with the holders of the present first-class preference shares created by the resolutions of October, 1842. The present shareholders are of course to have the privilege of taking a certain proportion of the new issue, and from the feeling of the meeting there is very little doubt that they will subscribe liberally. The resolutions authorising the directors to carry the views they express in their report into effect were carried all but unanimously, the only opponent being a shareholder who desired an adjournment to allow the proprietors an opportunity for reflection on the matter. It appears that although the directors propose to carry out the extension to the Thames as speedily as possible, they have not forgotten the advantages promised by carrying on the railway to Knightsbridge. From all that could be gathered during the proceedings the company expect to receive every assistance at the hands of the Great Western and Birmingham railways.—On Friday morning the Dinting viaduct now in course of erection across Dinting Vale, a short distance from the Glossop station on the Sheffield and Manchester line, fell in. The viaduct is of great height, vieing with that at Broadbottom, and comprises three stone arches raised from massive abutments or pillars. Two men were at work on the centres, one was killed on the spot and the other seriously injured. On Monday night on the same line a man who was walking on the line contrary to the orders of the Company was killed by the train, which passed over one of his legs and completely amputated it. The occurrence was entirely accidental and the engineer of the train could not have prevented it.—On Sunday morning as one of the luggage trains of the Eastern Counties Railway was proceeding from Colchester to London, on arriving at Springfield by some accident the train got off the rails, and after running about 15 yards some of the carriages with the engine were overturned. A number of labourers had been employed at the spot where the accident occurred in getting ballast for the repair of the line, and at the spot where the train appears to have run off there has been a sort of temporary rail laid down and which was used by the workmen to carry the gravel out of the cutting, and the labourers were at work at the time. The mail train had passed over the spot about an hour before but fortunately no accident occurred. The engine and tender were both thrown on their sides, and William Scott the stoker fell under the former and was killed upon the spot, and the engine-driver a man

named William Henney was so severely injured that he died soon afterwards. An inquest has been held and adjourned for a week for the production of further evidence respecting the conduct of the foreman and others employed upon the spot.

IRELAND.

"THE STATE PROSECUTIONS."—*Eleventh Day.*—The business of the trial was resumed on Friday morning, and commenced with the further reading of documentary evidence. A great number of speeches from reports of proceedings in the Repeal Association—of articles and letters in the *Pilot*, *Nation*, and *Freeman's Journal* newspapers—all tending in one way or another to throw additional light upon the charges made in the indictment. This species of the evidence, though not attractive to an Irish reader, in consequence of their previous familiar acquaintance with the greater part, was only tendered as newspaper articles, and not otherwise authenticated than as coming from journals published by the traversers. When the reading and notation of all the documentary proofs was completed, some oral testimony was given respecting the sitting of an "Arbitration Court" at Blackrock, and with this evidence the case for the Crown closed. The Attorney-General rose and said, "this was the case for the prosecution." It was past three P.M. when this took place, and upon application of counsel grounded on the illness of Mr. Sheil, the Court consented to allow the traversers till next morning to open their case.

Twelfth Day.—THE DEFENCE.—The Court was much crowded on Saturday morning at an early hour, from the general anxiety to hear Mr. Sheil open the defence of the traversers. The greatest stillness prevailed in Court when the learned gentleman commenced his statement. His exordium was delivered in a low and weak tone of voice, and he had the appearance of labouring under indisposition. How sacred, said he, was the trust reposed in the Jury! how great the task he had undertaken! In the fullest conviction of its magnitude he rose to address the Court, humbled but undismayed. He had confidence in the Jury upon the ascendancy of principle over prejudice in their minds. He had confidence in himself, derived from a thorough conviction of the innocence of his client. The father and son were indicted together,—the same blood flowed in their veins—their principles were the same. With the father he had toiled in companionship in the great work of Catholic Emancipation, conceived in the spirit of peace, and in that spirit carried by him to its glorious consummation. From the extraordinary misdeeds imputed to him he knew him to revolt with abhorrence. It was that persuasion that would sustain him and lift him to a level with the lofty duties which he should have to treat, in resisting a prosecution unparalleled in the annals of criminal jurisprudence of this country. The Attorney-General in his statement had referred to facts and events which occupied a period of about nine months. It was extraordinary that during so long a period no *ex officio* information had ever been filed—no prosecution instituted against the traversers or others who participated in these acts. The Attorney-General had acted more like a French Commissary of Police than an officer keeping watch and ward for the Crown. He had dwindled down into a mere "artful dodger." What was the reason of such long and great forbearance? To entrap, to ensnare, and decoy. Mr. Duffy might have been prosecuted, so might Mr. Barrett and Dr. Gray—but the Attorney-General's purpose. He was no fisher with rod and line—he fished with a net in which he hoped to catch the Conservative himself, three editors of newspapers, and a priest, at a single haul. Had he prosecuted them singly they would not have been responsible for each other; but by attacking them together upon a charge of conspiracy he obtained this advantage over them. The whole Repeal press of Ireland might as well have been included in the prosecution. He next referred to the prosecution of the rioters at the theatre in Lord Wellesley's time, and their indictment for a conspiracy; but a Protestant jury of that day did its duty and acquitted them. He then read some memoranda from Sir Walter Scott's life of Dean Swift, and often referred to some well-known facts in Irish history—Swift's efforts to raise the country from the state of misery in which it existed in his day—his publication of the Drapier's Letters, and the prosecution of Delany, for libel. Swift he said, was the first "Liberator," and his letters contained language as strong as that used by Mr. O'Connell. Why were not Swift and Grattan indicted for conspiracy in 1782? The English Minister had learnt a lesson from experience. The colonies were lost, but Ireland was saved by the timely recognition of the great principle that her independence was founded. If the Irish were 6,000,000 Protestants, would they be used as they were? They were prevented from co-operation in a single instance by hatred of religious distinctions?

"Detestable distinctions," said the Right Hon. gentleman, "detestable, because not only were they repugnant to the genuine spirit of Christianity, and substituted for the gentle charities the rancorous antipathies of sect, but they were calculated to degrade us to a colonial dependency, and, if they could arise, convert a nation into an appurtenance, a province, a dependency; the Minister, the scorn of England, and the laughing-stock of the world. Ireland is the only country in which such miserable distinctions between Protestant and Catholic are permitted to continue. In Germany, where the Reformation was born, in the land of the Dragonnades and the St. Bartholomew massacres; in France, where Calvin wrote his Institutes, in the land of the Albigenses, from whence the forefathers of one of the Judges of the Court and the first Ministerial witness against the traversers were barbarously driven—the mutual wrongs of Catholic and Protestant are forgiven and forgotten; and the only country in which we are, arrayed by that fell fanaticism which has desolated every other country in Europe, has found no precipitate curse to precipitate ourselves upon each other in these encounters of sectarian ferocity in which our country bleeding and lacerated is trodden under foot. We convert the island, noblest of the world, into a receptacle of degradation and of suffering, counteract the designs of Providence, and enter into a conspiracy for the frustration of the beneficent designs of God."

This burst of eloquence was received throughout the Court with an involuntary manifestation of applause. The Chief Justice intimated that if the interruption were renewed the Court must be cleared. Mr. Sheil expressed his regret at the interruption and proceeded. He referred to the Imperial Parliament of Cromwell, in which the Irish members (according to Burton's report) complained of their attendance upon a foreign Parliament, and asked to have a Parliament of their own. He then passed down to the period when the Union was agitated and carried—to the speeches of Saurin, Plunket, and Bushe, and other familiar topics. He then touched upon the various grievances of Ireland since the Union, and the failure of all the promises which accompanied the passing of that measure. In 1800 Mr. O'Connell first spoke against the Union. In 1810 he made a speech precisely similar to those for which he was now arraigned. His intentions were pure then, it could not be denied. If the language were the same now the intention must be identified as the same also. If the present indictment could be sustained, an indictment for a conspiracy might have been preferred against those who had associated themselves to obtain Catholic Emancipation. How too was the Reform Bill carried? Who were the conspirators who embarked in that fearful enterprise? Should he answer—Lord Grey, Lord J. Russell, Lord Althorp, and to crown the list, Sir J. Graham, now Home Secretary? Let gamblers denounce vice, drunkards denounce debauch, when Graham complained of agitation. It had been recommended that the Imperial Parliament should sit at certain intervals in Dublin. To that proposition he saw no sound objection; and he then painted a glowing picture of the advantages that would accrue from the realisation of that project. He would not deny that strong speeches had been made by his client and the other traversers, but he denied that they were more exciting or inflammatory than those which were spoken in almost all popular assemblies, Whig, Radical, or Conservative. Could they believe that in an old age not premature Mr. O'Connell could engage in an insane undertaking, in which his own life and the lives of those dearer to him than himself, and the lives of thousands of his countrymen would be sacrificed? Could he blast the laurels he had won, and lay prostrate that great moral monument which he had raised so high that it was visible from the remotest region of the world?

"There is not," said the right hon. gentleman, "a great city in Europe in which upon the day when the great intelligence shall be expected to arrive, men will not stop each other in the public way and inquire whether twelve men upon their oaths have doomed to incarceration the man who gave liberty to Ireland. Whatever may be your adjudication he is prepared to meet it. He knows that the eyes of the world are upon him, and that posterity whether in a gaol or out of it will look back to him with admiration. He is almost indifferent to what may befal him, and is far more solicitous for others at this moment than for himself. But I—at the commencement of what I have said to you—I told you that I was not unmoved, and that many incidents of my political life, the strange alternations of fortune through which I have passed, came back upon me; but now the bare possibility at which I have glanced has I acknowledge almost unmanned me. Shall I who stretch out to you in behalf of the son the hand whose fetters the father had struck off, live to cast my eyes upon that domicile of sorrow, in the vicinity of this great metropolis and say, 'Tis there they have immured the Liberator of Ireland with his fondest and best-beloved child?' No! it shall never be! You will not consign him to the spot to which the Attorney-General invites you to surrender him. No. When the spring shall have come again and the winter shall have passed—when the spring shall have come again, it is not through the windows of this mansion that the father of such a son, and the son of such a father, shall look upon those green hills on which the eyes of so many a captive have gazed so wistfully in vain; but in their own mountain home again they shall listen to the murmurs of the great Atlantic; they shall go forth and inhale the freshness of the morning air together; 'they shall be free of mountain solitude;' they will be encompassed with the loftiest images of liberty upon every side; and if time shall have stolen its suppleness from the father's knee, or impaired the firmness of his tread, he shall lean on the child of her that watches over him from heaven, and shall look out from some high place far and wide into the island, whose greatness and whose glory shall be for ever associated with his name. In your love of justice—in your love of Ireland—in your love of honesty and fair play—I place my confidence. I ask you for an acquittal, not only for the sake of your country but for your own. Upon the day when this trial shall have been brought to a termination, when, amidst the burst of public expectancy, in answer to the solemn interrogatory which shall be put to you by the officer of the Court, you shall answer 'Not Guilty,' with what a transport will that glorious negative be welcomed! How will you be blest adored, worshipped; and when retiring from this scene of excitement and of passion, you shall return to your own tranquil homes, how pleasurably will you look upon your children, in the consciousness that you have left them a patrimony of peace by impressing upon the Cabinet, that some other measure besides a State prosecution is necessary for the pacification of your country."

The speech was delivered in the most fervid and impassioned manner, and at the conclusion the right hon. gentleman appeared to be suffering much from exhaustion. A tremendous cheer greeted him as he sat down and soon afterwards the Court adjourned.

Thirteenth Day.—On Monday morning Mr. John O'Connell requested permission to make a brief explanation, lest any misunderstanding respecting his opinions should arise from what had fallen from his distinguished counsel Mr. Sheil on Saturday, respecting the occasional sitting of the Imperial Parliament in Dublin. He deemed it necessary to state that he could not, under any circumstances whatever, consent to the slightest compromise on the question of the Repeal of the Union. He never could be a party to any arrangement which might in the least degree compromise the inalienable right of Ireland to national and domestic legislation.—Mr. Moore, Q.C., then proceeded to address the Jury on the part of the Rev. Mr. Tierney. Alluding to the institution of this prosecution and the manner in which it had been conducted from the outset, he strongly deprecated the conduct of the Attorney-General and the Executive. If, he asked, the meetings were illegal, why had the Government permitted them to go on for such a length of time without prosecuting the parties? The Attorney-General if he believed those meetings to be illegal and dangerous, had been guilty of a criminal dereliction of duty, as the law-officer of the Government, in permitting them. The learned gentleman referred to the tardy and sudden interference of the Government on the very eve of the Clontarf meeting, under circumstances which rendered their interposition perilous to the public peace. Mr. O'Connell by an almost superhuman exertion had prevented the people from attending that meeting, and to him the great merit was due of averting the calamitous consequences that must have ensued from any collision between the military and the populace. The learned gentleman proceeded at considerable length to review the evidence, contending that the prosecution had totally failed, whilst there was not the slightest evidence of "conspiracy," and concluded by expressing his full conviction that the Jury would return a verdict acquitting the traversers.—Mr. Hatchel then rose on the part of Mr. Ray, the well-known Secretary of the Repeal Association, and contended that his client was a mere paid clerk of that society, and ought to incur no legal liability on that account, as the association was not an illegal one. He had made no speeches, printed no libels—he was a mere officer of a perfectly lawful society. He was a man with a large family and had no other business to attend to. He had attended the Tara meeting, but quite as an excursion of pleasure.—It then became Mr. Fitzgibbon's turn to speak for his client Dr. Gray; but he pleaded indisposition, and requested the Court to indulge him with a postponement to next morning. Some discussion arose on this head. The Attorney-General complained of the delay, but the Court after a good deal of hesitation at length consented to the adjournment. The proceedings consequently closed at the unusual hour of two o'clock.

Fourteenth Day.—Mr. Fitzgibbon, as Counsel for Dr. Gray, entered upon his address on Tuesday. The Court was less crowded than upon any previous day. Mr. O'Connell sat beside Mr. Fitzgibbon for a short time, and then announced through counsel that he was obliged by particular business to absent himself. Mr. Fitzgibbon said he was counsel for Dr. Gray, but so mixed together were the parties in this case, and so multifarious the evidence, he would not attempt to separate the case of his client from that of the other traversers. He would treat the case merely as a lawyer—and survey it solely in its legal aspect. He considered this mode of prosecution for a constructive conspiracy as unconstitutional and unfair; it was a sort of Ministerial scourge, used for the purpose of persecuting and lashing a free people. He reminded the three leading counsel for the Crown that State prosecutions had proved damaging to the reputation of many eminent lawyers. He said, without disparagement to any living member of the profession in any country, that the Crown counsel had followed the example of Lord Coke himself, whose virtue and dignity as a lawyer were not proof against those personal feelings that in all cases had ever governed the conduct of a state lawyer in a state prosecution. The name of the great Lord Coke came down to succeeding generations with the foul blot upon it of his prosecution of Sir Walter Raleigh—and there were other remarkable instances of the same kind. The present was a prosecution which ought at all events to have been carried on fairly. It was a contest in the very temple of justice for the character and liberty of the subject; and on the side of the prosecutor especially was one which demanded the utmost candour, circumspection, and fairness. But such had not been the conduct pursued in this instance. As to the law as laid down by the Attorney-General he did not concur in his statement of it. It was not necessary perhaps for his learned colleague, Mr. Moore, to controvert that statement, for he was concerned for a gentleman who had only attended a single meeting—a man against whom no acts of confederacy beyond one or two of a trifling or isolated character had been proved. He however could not make that peculiar case for his client Dr. Gray. He therefore felt bound to inquire into the law of the subject—and to expose the absurdity that would result from taking it as the Attorney-General had stated it. The learned gentleman then entered upon a long and elaborate legal investigation, the great object of which appeared to be to decry the doctrine of constructive treason and constructive conspiracy. Mr. Fitzgibbon not having finished his speech at 2 o'clock, the Court, as it usually does, adjourned for a short time. In about half-an-hour the Judges returned, when Mr. Fitzgibbon said that while he was endeavouring during the adjournment of the Court to take a little rest, rendered necessary by his state of health, a note was placed in his hand signed by the Attorney-General, which he deemed it his duty to return. In that note the Attorney-General said that he had in his address to the Court given him personal offence, telling him that if he did not apologise at once, to name his friend. A scene of much excitement ensued, which lasted nearly half-an-hour. Mr. Fitzgibbon called upon the Attorney-General to produce the note conveying the challenge, but he did not comply with the demand. The Judges consulted together, and at length Mr. Moore, Q.C., one of the traversers' counsel, threw out a conciliatory suggestion, for which he was thanked by the Chief Justice, who said the Court would give no sort of opinion with regard to the conduct of gentlemen on either side, more especially when such a case as the present was pending before the Jury and the public at large. They felt however that of every member in the profession the Attorney-General was the last man who ought to allow himself to be betrayed into such an expression of feeling. The At-

torney-General said that he acted under very strongly irritated feelings and that he had no objection to withdraw the note. As he had done so he would not propose any terms, but merely leave it to Mr. Fitzgibbon whether the feelings of a gentleman might prompt the retractation of the offensive terms that had been used. Mutual explanations followed, and Mr. Fitzgibbon resumed his speech and at length requested permission to defer the remaining portion of it to the next day. The Chief Justice expressed great disappointment at the delay, especially as they had adjourned on Monday at an early hour for Mr. Fitzgibbon's convenience, but they ultimately consented to the adjournment. As they were about to rise Dr. Gray attempted to address the Court, but the Judges refused to hear him, especially during the speech of his own counsel.

Fifteenth Day.—On Wednesday Mr. Fitzgibbon having resumed his speech, stated that although this was the morning of the second day on which he had to address them, yet his own peace of mind required that he should discharge his duty to his client by bringing forward the real merits of the case. He then proceeded at very great length to comment on the speech of Mr. O'Connell at Tara, and insisted that from the context the meaning of the speaker was to engage in a constitutional struggle and not to take up arms. If the Attorney-General were really of opinion that the language used was meant to induce the people to engage in rebellion he had violated his duty to the Crown by not prosecuting the traversers for high treason, and if these acts constituted the crime of high treason then the traversers ought to be acquitted, because the misdemeanour would have merged in the higher offence. When he came to the passage of Mr. O'Connell's speech in which he spoke of the time when "the Saxon polluted the virgin soil of Ireland with his accursed foot," Mr. Fitzgibbon contended that this language was perfectly true, and it was mere nonsense to endeavour to change the history of the human race by a state prosecution. Had not the Saxons trampled on the liberties of the British race and resorted to the favourite measure of physical force? and when allusion was made to that race no reference was meant to any persons of the present day, for where could the jury put their hand on any man in whose veins flowed the unmingled Saxon blood? If Mr. O'Connell wished to resort to physical force, he would not have discountenanced the Chartists, but from the beginning he had set his face against that party because they resorted to the torch and the dagger. He wished to form an exclusively Irish party which would have the good of the country at heart, and had there been an Irish party up to this period? Orangemen, Ribbonmen, Whigs, Tories, and Radicals, he was sick of them all, and what honest man was not sick of them all, actuated as they were by the selfish motives of advancing their interests alone, regardless of the people? Was it an honest man or a fool that instituted the present prosecution, after the sentiments of love, of peace, and of order inculcated by the great leader of the Irish? The learned counsel, after adverting to a variety of topics said that five-sixths of the legislature were composed of men ignorant of the character of the Irish people. It was owing to such a circumstance that he could account for the passing of a poor-law bill, founded on the principle that wretches whom it was not lawful to kill should be immured in a kind of gaol and supported at the expense of those who had not yet become paupers themselves, although many were on the verge of that state. The learned counsel in great detail went on to censure the conduct of the Attorney-General for assimilating the proceedings to gain Repeal with the acts of those who fomented the rebellion of 1798, and complained of his reading statements from the report of the Committee of Secrecy which he never proved. But the true parallel to the present system which was meant to carry Repeal, was the system by which Catholic Emancipation had been carried, namely, the display of the moral and constitutional power of the people. A concert to effect legal objects by illegal means was not a crime, and for this he had the authority of Lord Ellenborough in the case of the King v. Turner and eight others. If parties entered into a conspiracy to commit a particular act, he submitted that the parties must know that the object they had in view was a criminal one in order to constitute an offence. The learned gentleman concluded by referring to the *fracas* of the preceding day, and expressing his regret at the occurrence. It was an incident which he should regret to the latest hour of his life, not for any injury it might inflict upon himself, but for that which it might produce to one whom he had long known and esteemed.

Dublin.—The weekly meeting of the Repeal Association took place in the Conciliation Hall on Monday, and the house was denselycrowded. Mr. Caleb Powell, M.P., was called to the chair. After the transaction of some business, Mr. Smith O'Brien proposed a series of resolutions to the effect that each parish should defray the expenses of its own representatives, which were carried by acclamation. Mr. O'Connell addressed a few observations to the meeting, and the Rev. Mr. O'Malley deprecated any language which might give offence to the Federalists, whom he termed the *corps de reserve* of the Repealers. Mr. Wallace, an American gentleman, addressed the meeting, but was called to order by Mr. O'Connell, in consequence of strong language which he made use of. Mr. S. O'Brien gave notice of a motion for the appointment of a committee to watch over the proceedings of Members of Parliament. The Repeal rent was announced to be 372*l.* 14*s.* 11*d.*—A Deputation from the Dublin Corporation consisting of the Lord Mayor and some of the Aldermen and Town Council, had an audience of her Majesty yesterday to present an address praying for an amnesty for the traversers. The Queen received the deputation in the presence of the Duke of Wellington, Sir R. Peel and other members of the Cabinet and returned the following reply:—"I receive with satisfaction the assurance that sentiments of loyalty and of attachment to my person and crown continue to be cherished by you. The legal proceedings to which you refer are now in progress before a competent tribunal, and I am unwilling to interrupt the administration of justice according to law. It is at all times my anxious desire that any grievance of which my people can justly complain should be speedily redressed, and I confide in the wisdom of the Parliament of the United Kingdom for the adoption of such legislative measures as may be necessary for that purpose."

Law.

COURT OF QUEEN'S BENCH.—*The Queen* v. *Holt* and *Brander*.—On Monday, Mr. Justice Patteson delivered judgment in this case, which was founded on a criminal information obtained against Thomas Holt, George Frederick Brander, and another person (who did not appear), as the proprietors of the *Age* newspaper, for a series of libels which had been published in that paper against the Duke of Brunswick. The case was afterwards tried, and a verdict of Guilty returned. After recapitulating the facts of the case, his Lordship said, in reference to the pleas of the defendants in mitigation of punishment, "We are asked to believe that these different libels were inserted incautiously, though it is palpably false, as it appears upon the face of it. Many objections were addressed in mitigation of punishment, though I have not heard anything at all tending that way. The conduct of the case on the trial and that adopted now is far from mitigation, it has a tendency to aggravate it. But, be that as it may, it is said you Thomas Holt have suffered from being imprisoned in an improper manner when you were arrested. Lord Denman has already mentioned that we hold that to be a very improper proceeding—that you were apprehended on Saturday for the purpose of detaining you in prison till the Monday. It is a great abuse of the process of this Court, and the Court will not sanction anything of the sort; and if you really had suffered anything from it the Court would take it into consideration. You say you have been dismissed from the editorship of this paper, and that is said to be a great punishment in itself, and it is mentioned as a circumstance which ought to induce us to inflict a lighter punishment. If we are to take, as a specimen of the character of the paper, these different paragraphs, as to the manner in which you have carried on the office, so far from the dismissal being a grievance, it is the best thing that could have happened to you, or you would have committed these offences more and more. George Frederick Brander, you stand before the Court in a different situation, because certainly you are not the person who had the conduct of the newspaper, or overlooked the articles before they were inserted. You were resident at a great distance, and you are found only as proprietor of the newspaper. In law, however, it has been well known that no one can connect himself as the proprietor of a newspaper who can be said to be ignorant that he is liable, both civilly and criminally, for everything that appears in the paper, and therefore it became you, when in the year 1837 you first proposed for a sum of money to have shares in this paper—it became you to inquire what sort of newspaper this was before you connected yourself with it, otherwise you ran a great risk of persons having your money to enable others to carry on the newspaper and insert what they thought fit. It is very material and important that all proprietors of papers should be aware of the liability they incur. It may not unfrequently happen that they are the only persons against whom any compensation can be recovered if an action is brought, and sometimes the only persons who can be brought before the Court, because the persons who actually inserted the articles often go away, and no persons are amenable but those who are the actual proprietors of the paper. Nevertheless, the character of your offence is very different from that of the person who actually inserted the paragraph. Taking all the circumstances into consideration, the sentence of the Court is that you, Thomas Holt, be imprisoned in the Queen's Prison for 12 calendar months, and that you, George Frederick Brander, be imprisoned for three months.

The Queen v. *M'Neil.*—The defendant in this case, Mr. Forbes M'Neil, appeared to receive judgment on a charge of having assaulted Mr. John Abel Smith, in Belgrave Square. The assault was committed in consequence of some expressions used by Mr. Smith with reference to the defendant's conduct in certain matters relating to bills of exchange put into circulation by the defendant, and the particulars were fully given in the report of the trial. Mr. Justice Patteson now delivered judgment, and said, that the Court would diminish the term of the imprisonment they intended to impose, on account of the bad health of the defendant. He then sentenced him to be imprisoned in the Queen's Prison for three calendar months.

The Queen v. *The Lord Mayor of London.*—The Att.-Gen. and Mr. Richards showed cause against a rule obtained on the part of Fletcher, one of the persons charged in the Forged Will Case, for a *mandamus* calling on the Lord Mayor to give Fletcher copies of the depositions made in this case. The fact on which this application was founded, showed that Fletcher had been examined before the Lord Mayor on a charge of having participated in these forgeries, and had been by the Lord Mayor recommitted for examination. Under these circumstances it was contended that the application must be refused. It was made under the authority of the 6th and 7th Will. IV., c. 114, which gave to prisoners the right of being defended by counsel, and of having copies of the depositions made against them, but was held not to apply to cases where a man was merely committed for re-examination, but where he was committed for trial, which alone was a committal that within the words of the Act could be considered a committal for the offence. Mr. Kelly and Mr. Ballantine supported the rule. The Court, however, were unanimously of opinion that the depositions were not to be given till a committal for trial, and the rule was consequently discharged.

BIRTHS.—On the 20th Dec., at Cainsmore, Minnigaff, the lady of J. STEWART, Esq., of a son.—22d Dec., at Edinburgh, the lady of A. FORBES, Esq., W.S., of a son.—25th Dec., at Ardpatrick House, Argyllshire, Mrs. CAMPBELL, of Kilberry, of a son.—20th, ult., at the Trafalgar, Greenwich, Mrs. CHARLES HART, of a son.—22d ult., at Upper Tulse-hill, Brixton, the lady of C. B. RULE, Esq., of a son.—24th ult., at Deene-park, Lady AUGUSTA BARING, of a son.—24th ult., at St. Leonard's-on-Sea, the lady of the Rev. T. K. THOMAS, of a son.—24th ult., at Barnstaple, Devon, the lady of T. STEPHENS, Esq., of a son.—24th ult., at Redhill, Havant, Hants, the wife of the Rev. T. YARD, of a son.

MARRIED.—On the 23d Dec., at Carlow, AUDLEY PARSONS Esq., of Wolverhampton, second son of W. Parsons, Esq., of Carlow, to REBECCA, third daughter of the late J. Mark, Esq., of Cork. 25th Dec., the Rev. JOHN GRIFFITHS, chaplain on the Bombay Establishment, to FRANCES, fourth daughter of Captain Mortlock (late captain of the Hon. E.I.C.'s Naval Service,) Brighton.—24th ult., at Llanlligan, JOHN, son of T. Higham Esq., of Charleston, South Carolina, U.S., and Margate, Kent,, to LETITIA, daughter of Col. W. Lyster, late of Greenford Manor-house, Middlesex.- 25th ult., at St. Mary's, Reading, ARTHUR DEAN, Esq., Civil Engineer, of London, to MARIA, daughter of the late J. Woodhouse, Esq., of Highgate-lodge, Dublin.

DIED.—On the 22d Dec., at Haverfordwest, aged 71, the Rev. JOSIAH HILL, Wesleyan minister.—23d Dec., at Riverview Avenue, Rathgar, the Rev. SKEFFINGTON PRESTON, rector of Drumconra, county of Meath, only surviving brother of the late Lord Tara, aged 68.—24th Dec., at Newcastle, aged 25, GEORGIANA MARY, daughter of the late James Emslie, Esq., barrackmaster, Dundee.—25th Dec., at Winchester, aged 71, CHARLES HAWTHORNE, Esq., of Reading, for upwards of 30 years a magistrate of the town of Basingstoke.—28th ult., suddenly, at Whitehead's Grove, Chelsea, aged 71, T. F. HAWKES, Esq., late master shipwright of H.M.'s Dockyard, Devonport.—16th ult., of apoplexy, at Barford-house, Warwick, LIEUT. RATTRAY, R.N., third son of the late Charles Rattray, M.D., of Daventry, Northamptonshire, aged 28.—23d ult., at New Brighton, near Liverpool, aged 36, CHARLOTTE JEMIMA, wife of W. A. Dawson, Esq.—26th ult., SELINA, wife of John Russell, Esq., of Claremont-square, Pentonville.—26th ult., at Hastings, LADY OAKELEY, wife of Archdeacon Sir Herbert Oakeley, Bart.—Lately, at his residence, near Southampton, the Hon. CHARLES ST. JOHN, youngest brother of Viscount Bolingbroke.—26th ult., at her residence at Ealing, the Hon. LADY CARR, relict of the late Sir H. W. Carr, K.C.B., and of the late Rt. Hon. S Percival.—26th ult., at Combermere Abbey, Cheshire, aged 86, R. GIBBINGS, Esq., of Gibbing's-grove, in the county of Limerick.—26th ult., aged 91, Mrs. ANN ATKINSON, of Chatham-place, Walworth.—26th ult., at Langton-place, North Brixton, aged 48, AMEY, wife of H. Ager, an officer in the late Maritime Service of the E.I.C.—27th ult., of inflammation of the larynx, after 48 hours' illness, ADA ELLEN ADELAIDE TOLDEROY, aged 7½, second daughter of F. V. Lee, Esq., 1, Chesterplace, Regent's Park.—Yesterday morning (Wednesday) Mr. FRANCIS GOODSON, office-keeper at the Police-court, Bow-st., at his residence attached to the court. He had been 21 years in the service of Government, attached to Bow-st., and 15 years court-keeper.—27th ult., at 22, Tysoe-street, Wilmington-square, aged 27, ELIZA, the wife of Mr. David Craven.

GAZETTE OF THE WEEK.

BANKRUPTS.—G. HILLER, Sun-street, Bishopsgate-street, varnish-manufacturer—J. TUBB, Basingstoke, Hants, draper—T. BALLS, Thames street, iron-merchant—W. BUTCHER, Great Marlborough-street, commission-agent—A. LEQUEUTRE, Chingford Mills, Essex, miller—T. RODHAM, Newcastle-upon-Tyne, grocer—J. LEECH, Newcastle-upon-Tyne, ironmonger—T. EARRINGE, Manchester, tobacconist—H. MURCH, Norton-under-Hamdon, Somersetshire, sail cloth manufacturer—D. LAMONT, West Smithfield, publican—W. L. WOOD, Bishopsgate Within, ironmonger—R. PETTIT, Exning, Suffolk, livery stable keeper—J. H. PERRYMAN, Birmingham, bookseller—R. PHILLOTT, Blagdon, Somersetshire, scrivener—J. R. DRAGE, Leeds, tallow-merchant—W. WEBB, Leamington, Warwickshire, hotel-keeper—G. COOPER, Leeds, butcher—W. THOMPSON and J. MELLIS, Newcastle-upon-Tyne, commission-agents.

SCOTCH SEQUESTRATIONS.—C. E. MAILLARDET, Drumcarro, Fifeshire, coalmaster—D. and W. ROSS, Balintore, Ross-shire, merchants.

WANTED, a young or middle-aged Man, as PROPAGATOR in an Establishment in the neighbourhood of London where nothing but pot plants are grown. He must thoroughly understand his business in all its branches.—Apply, by letter (post paid), to A. B., 19, Milk-street, City, stating where he has lived in that capacity.

WANTED.—An active young Man, who understands the general routine of Nursery work. One who has been bred in a Scotch Nursery would be preferred.—Apply, stating full particulars, to J. GRIGOR, Lahenham, Norwich.

WANT PLACES.—All Letters to be post-paid.

AS PRACTICAL GARDENER.—The Advertiser, about changing his Establishment, has great pleasure in recommending to any one wanting a good practical Gardener one who has lived with him 18 years, a successful grower of Pines, Grapes, care of Greenhouse, &c.; has obtained 130 prizes at various shows; is 35 years of age, a married man, and thoroughly understands his profession.—Direct to A. B., at Messrs. THOMAS & SONS', 20, Cornhill.

TO NOBLEMEN AND GENTLEMEN.

AS PRACTICAL GARDENER.—A young Man, well versed in the science of Horticulture, is desirous of engaging with a gentleman in the above capacity. Can give first-rate references as to ability, &c.—Direct to J. S., 73, Jermyn-street, St. James's, London.

AS GARDENER.—A young Man, 27 years of age, has a thorough knowledge of his profession in all its various branches. He can be highly recommended by a Nobleman in Scotland. His character will bear the strictest investigation. A house on the grounds would be preferred.—Direct to J. B., at H. RONALDS AND SON'S, New Brentford, Middlesex.

AS GARDENER and BAILIFF.—A most respectable married Man, who is well acquainted with Cattle, and also understands buying and selling. He can have a most excellent character from the situation he has just left.—Direct to A. V., No. 7, Norfolk-place, Shacklewell, near London.

AS GARDENER.—A middle-aged married Man, without family, of respectable habits, who is well experienced in the cultivation of Pines and Vines, and Early Forcing in general; also the management of hothouse and greenhouse; has had good practice in the propagation and cultivation of plants, on the most improved principles; he has no objection to any part of the country, and can give two years' character.—Direct to A. B., Post-office, Petersfield, Hants.

AS GARDENER.—A respectable, steady, active, sober, young Man, aged 25, who perfectly understands Forcing, Kitchen, Fruit, and Flower Gardening; he being a Farmer's Son has no objection to take charge of Land. Can be well recommended by the Clergyman he has lived with.—Direct to Y.Z., Post-office, Uckfield.

AS GARDENER.—A respectable married Man, aged 30, who is a first-rate Grape Grower; with Forcing in all its various Departments. Has likewise a perfect knowledge of the Flower, Fruit, and Kitchen Gardens, with an eight years' unexceptionable character.—Direct to A. Z., 2, Adelaide-terrace, Halton-street, Islington.

AS GARDENER AND BAILIFF.—A most respectable married Man, without encumbrance; is well acquainted with Cattle—understands buying and selling. He can have a most undeniable character from the place he has just left.—Direct to A.V., No. 7, Norfolk-place, Shacklewell, near London.

AS GARDENER or UNDER-GARDENER in a Nobleman or Gentleman's Establishment.—A single young Man, 25 years of age, can be highly recommended by any former employer he may have had during the last seven years; would have no objection to any part of the United Kingdom.—Direct to R. F., Mr. THOMAS's General Advertising Office, 21, Catherine-street, Strand.

AS GARDENER, where one or more Men are kept.—A young Man, aged 36, who perfectly understands Forcing, Kitchen, Fruit, and Flower Gardening, and has a practical knowledge of the cultivation of Plants. Has no objection to take charge of Land, and can have an unexceptionable character from the gentleman he has lived with four years.—Direct to A. B., at Mr. Foot's, Fruiterer, Church-street, Stoke Newington.

AS FOREMAN OR PROPAGATOR, in a Nursery.—A respectable young Man, who perfectly understands his Business, having passed the most part of his life in its various branches. Satisfactory reference can be given.—Direct to A.B., at Messrs. Lockhart's, Seedsmen, Cheapside, London.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 6.—1844. SATURDAY, FEBRUARY 10. [Price 6*d*.

Lemons, to preserve	86 *a*		

THE LATE Mr. LOUDON.—A Public Meeting of the Friends of the late Mr. Loudon will be held in the large room of the Horticultural Society's Establishment, Regent-street, London, on Saturday, Feb. 17, at Two o'clock precisely, to consider the best means of extricating his Widow and Daughter from the difficulties into which they are placed by Mr. Loudon's sudden death.

It is hoped that noblemen and gentlemen who patronise Horticulture, and also all Gardeners and Nurserymen who are within a reasonable distance, will attend.

RESIDENCE, WANTED to RENT, placed in a park or parklike grounds. Must contain good entertaining rooms, five or six best bedchambers, with all suitable offices for not an extensive establishment, and if with a farm of 20 acres, would be desirable. Would be taken on lease, and the occupant prove an unusually advantageous tenant. Full particulars and terms to be addressed to Messrs. Hedger, Land Agents, 10, New Bond-street, opposite the Clarendon.

E. P. FRANCIS, Nurseryman, Hertford, begs leave to recommend to the Nobility, Gentry, and the Trade in general, Snow's superb white winter BROCCOLI, in 2*s*. packets, containing half an ounce, which was advertised last season, and will be found to give general satisfaction this winter and the ensuing spring. Also Snow's Hybrid Prolific Green-flesh MELON, of most excellent rich sweet flavour, warranted to produce two and three crops in a season, from the same plants; has taken six first prizes at the North Herts and South Beds Horticultural Exhibitions, weight from 2 to 3 lbs., sold in packets, 5*s*. each. Also, Snow's Superb Walcheren CAULIFLOWER, which is found to be late and hardy, never runs, and produces beautiful large compact white heads, and is very dwarf. Sold in packets at 2*s*. each, containing half an ounce.

E. P. F. begs also to recommend a very superior kind of Grange's White BROCCOLI, which produces large compact heads in the months of January, February, and March. Sold in packets, 2*s*., containing half an ounce. The above, making four packets, if ordered together, may be had for 10*s*., at the Hertford Nurseries, or of Messrs. Noble, Seedsmen, 152, Fleet-street; Messrs. J. Wrench & Son, London Bridge, and Mr. Flanagan, opposite the Mansion House, London.

KENSINGTON NURSERIES.

RICHARD FORREST and Co. beg leave respectfully to direct attention to their GENERAL NURSERY STOCK, which was never finer than this season, especially the extensive and correctly-named Collection of FRUIT-TREES.—See Advertisement for Nov. and Dec. 1843, of this Journal.

In consequence of the Lease of one of their Nurseries expiring, and being required for other purposes, R. F. & Co. deem it necessary to assure their Customers everywhere that it will not occasion the slightest interruption in their business. The Shop, Warehouses, &c. will remain undisturbed, and the ample provision which has been made in the adjoining Nurseries for this little change will insure the same supply, and attention to all the Customers, which they have uniformly experienced. To those who have visited the Nurseries recently, these observations are perhaps unnecessary; but to those who have not had an opportunity of witnessing the improvement of their Stock, R. F. & Co. consider this slight notice necessary to counteract any prejudice that might be raised in the minds of their numerous friends throughout these kingdoms and elsewhere.

NEW SEEDLING FUCHSIA "SIDMOUTHII" will be ready to send out in May next; price 10*s*. 6*d*. each, carriage free.—This magnificent variety was raised last year by Mr. Bartlett, Nurseryman, Sidmouth. It may be considered the finest hybrid extant. The flowers are large and colour brilliant, is a strong grower and prolific bloomer, with fine foliage. A specimen flower was sent to the Editor of the *Gardeners' Chronicle* last October, who spoke so high in its praise that anything further is superfluous, beyond its character as above. Visitors to Sidmouth will be gratified by viewing Mr. B.'s Collection of this lovely and graceful flower; having a mode of treatment peculiarly his own.

*** To secure fine plants early orders are desirable.

SEEDS AND DAHLIAS.

LOUIS VAN HOUTTE, Ghent, Nursery and Seedsman to the King of Belgium, begs to inform the Trade that his Price-currents, Nos. 13, 14, and 15, are sent out, containing the SEEDS and the DAHLIAS, and may be obtained by application to Mr. Geo. Rhan, Crescent, Minories, London (if by letter post-paid).

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE MOST NOBLE THE MARQUIS OF AILSA, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL and Co. have much pleasure in announcing they are now supplying fine Canes of the above highly-valuable and much-esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and has been awarded several prizes at various Horticultural exhibitions during the season. As a proof they have not exaggerated its excellent qualities, fruit was submitted to Dr. Lindley, (see *Gardeners' Chronicle* of the 22d July last, page 502), whose opinion of it is as follows:—

"Fastolff Raspberry.—We have received from Messrs. Youell, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find it merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded. It would therefore be unnecessary for Youell and Co. to recommend it more fully, or with greater confidence, to the notice of the public, merely observing, that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

Packages containing 100 Canes			£2	5*s*.	0*d*.
Do.	do.	50 do.	1	5	0
Do.	do.	25 do.	0	14	0

Package included.

The usual discount to the Trade, when not less than 200 are ordered.

*** Caution.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine, unless purchased direct from their Nursery.

YOUELL'S TOBOLSK RHUBARB, Patronised by Her Most Gracious Majesty the Queen, and many of the Nobility, 12*s*. per dozen.—For particulars of which see their Advertisement of the 18th November.

TWO NEW SEEDLING PICOTEES.—"Lady Alice Peel," 10*s*. 6*d*., and "Mrs. Benyon," 10*s*. 6*d*. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. Youell and Co., for particulars of which see their Advertisement in this Paper of the 16th of Sept.

FINEST CARNATIONS AND PICOTEES.

YOUELL and CO. beg to refer the readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly-esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:—	£	*s*.	*d*.
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	3	0	0
12 ditto extra fine and very superior ditto ..	2	10	0
25 ditto ditto ditto ..	5	0	0

The selection being left to Youell and Co.

FUCHSIAS.

1 dozen of the newest and very best sorts ..	21*s*.
1 dozen fine ditto	12*s*.
1 dozen good show varieties	8*s*.

Sent by post, free, to any part of the United Kingdom.

ARAUCARIA IMBRICATA.

YOUELL and CO., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 9 inches high, 10*l*. per 100, or 30*s*. per dozen.—Great Yarmouth Nursery, Feb. 8, 1844.

TO NURSERYMEN, &c., &c.

JOHN BETHAM, CUSTOM-HOUSE and GENERAL FORWARDING AGENT, begs to inform the above, that he continues to receive and forward consignments of Plants and Seeds with strict attention, despatch, and moderate charges. Every information given as to the arrival and departure of vessels to or from Hamburgh, Rotterdam, Ostend, Antwerp, Calais, Havre, or Boulogne; also the United States, Scotland, &c., &c.

Address, Cox & Hammonds' Quay, Lower Thames-street. London, February, 1844.

NEW DAHLIA, "SYRED'S HERO OF MAIDA." Colour, bright orange; well cupped, and very constant, strong robust habit, adapted for a back-row flower; and where colour is predominant in class-showing it is superior to any orange yet out. Having been raised by an Amateur it was only exhibited for competition at Hammersmith, where it obtained the first Seedling prize, and at Stockwell Seedling Show, where it also obtained a prize.

Daniel Syred, Nurseryman, Blomfield-road, Maida-hill, Paddington, having purchased the stock of the above fine Dahlia, he has a few ground-roots left to spare, at 3*l*. each, and strong pot-roots at 1*l*. 10*s*. each. Plants 1st May, 10*s*. 6*d*. each. The usual discount to the Trade. No objection to exchange roots or plants for any approved variety.—London, Feb. 1, 1844.

GENUINE BEECHWOOD MELON SEED.

R. GLENDINNING respectfully begs to inform the Cultivators of the MELON that he has had presented to him by Sir John S. Sebright, Bart., Seeds of the *true* variety of his delicious MELON; for besides being one of the very best sorts known, it is of easy cultivation and a good bearer. This opportunity will enable gentlemen to procure it *quite genuine*, which is rarely the case, as the following note will testify:—

"Beechwood, Feb 5, 1844.

"Sir,—I send you a small parcel of the Beechwood Melon Seed. None that I have seen exhibited under that name, nor any that I have seen grown from Seed that has been bought, are of the true sort, but have obviously been intermixed with other varieties. I have grown no other for many years.

"Your obedient servant,

"To Mr. Glendinning. "J. S. Sebright."

R. G. has also a few Seeds of the true SION FREE-BEARING CUCUMBER, a splendid variety which has been nearly lost.

Packets of the above sent by post free.

Beechwood Melon, per packet . . . 5*s*.
Sion Free-bearing Cucumber, per packet . 5*s*.

R. G.'s Kitchen-garden and Flower-Seeds have been selected with great care, and embrace all the new and good kinds.

Chiswick Nursery, near London, Feb. 6, 1844.

A SUCCESSFUL METHOD OF GROWING LISIANTHUS RUSSELLIANUS.

J. CUTHILL has printed the whole account of his treatment of the above Plant. It is said by Dr. Lindley in the *Gardeners' Chronicle*, that he (J. Cuthill) is the most successful grower of it round London. From its noble and splendid appearance, it must become as generally grown as any other tribe of plants. His large Plant this year had 600 blossoms on it, and gained the Large Silver Medal at the Royal South London Exhibition; and at the same show, eight more Plants, with nearly 2,000 blossoms, gained an Extra Prize. The Printed Directions and a Packet of Seed will be sent out at the moderate price of 2*s*. 6*d*.; also plants of the above, from 2*s*. to 3*s*. each; they can be sent in little bulk until the end of this month, when they will begin to grow.

Cuthill's Celebrated Early Melon.—J. C. assures those Gardeners who have not grown it, that it is one of the most Early and Prolific ever known; his Early Black Spine Cucumber, the true Beechwood Melon, as exhibited before Dr. Lindley at Regent-street—the single packets 2*s*. 6*d*. each, or 8*s*. for the four.

A Lad about 17 years' old wanted; board and lodging, with 2*s*. per week, will be given; a small premium required.

Orders payable on Camberwell Post-office. — Direct, Jas. Cuthill, Florist, Denmark-hill, Camberwell.

*** Fine Cucumber-plants at any time.

TWO ARAUCARIA EXCELSA and one A. CUNNINGHAMI, in pots, 8 ft. high, well furnished and as handsome as ever were seen, to be sold a bargain, for want of room.

Also Araucaria imbricata, 6 to 9 in., 5*s*. to 7*s*. 6*d*.; Pinus excelsa, 18*s*. per doz.; P. deodara, 3*s*. 6*d*. each; P. Lambertiana, 10*s*. 6*d*. each; P. Gerardiana, 5*s*. each; P. cimbra, 3 to 4 ft., 3*s*. 6*d*.; P. Morinda, 2 ft., 5*s*.; smaller, 2*s*. 6*d*.; Abies canadensis, 4 ft., and very handsome, 7*s*. 6*d*.; Cupressus torulosa, 2 ft., 5*s*.; Juniperus thurifera, 3 ft., 7*s*. 6*d*.; J. recurva, 1½ to 2 ft., 3*s*. 6*d*. to 5*s*.; Juniperus, a new species from Nepal, 21*s*.

A large assortment of Epacris and Heaths now ready for the one-shift system, 9*s*. per doz.

To be had of Marnock and Manley, Nurserymen, Hackney.

P.S.—Their Walcheren Cauliflower is peculiarly their own (no connection with any other house), and should now be sown for the first crop.—Catalogues of new and choice Flower-seeds, with the best modes of cultivation, to be had on application.

Hackney, Feb. 7, 1844.

HYACINTHS AND GROWING STOCK.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1*s*. 9*d*. each, by Flanagan and Son, Mansion-house-street; Warner and Warner, Cornhill; Hurst & McMullen, Leadenhall-st.; W. Clark, Bishopsgate-within; Smith, Islington Nursery; Grimley and Co., Covent Garden; Batt and Rutley, 412, Strand; William and John Noble, Fleet-street; Smith, Covent-garden; Charlwood, Tavistock-row; W. J. Nutting, 46, Cheapside; G. Lawrence, 18, Piccadilly; John Kernan, Great Russell-street, Covent Garden; Lockhart, 156, Cheapside; Shuttleworth, Pantheon; Minier, Adams, and Nash, 63, Strand; Thatcher and Son, Islington; J. Fryer, Clarendon-terrace, Camberwell; Thomas Ansell, Camden Town; Thomas Watkinson, Market-place, Manchester; W. E. Rendle, Plymouth; Dickson & Co., Edinburgh; Pontey, Leeds; Fisher, Holmes, and Co., Sheffield; P. Lawson and Son, Edinburgh; J. Thorne, Shepton Mallet; and other leading Seedsmen in town and country. Wholesale Agents, Davy, Mackmurdo, and Co., 100, Upper-Thames-st., London.

ORANGE and LEMON TREES, from 8*s*. to 25*s*. DOUBLE ITALIAN TUBEROSE ROOTS, 3*s*. per dozen.—R. HALL begs to advise the arrival of his Annual Importation of the above-named Trees and Bulbs, which are this year remarkably fine, at his Foreign Warehouse, 63, South Audley-street, Grosvenor-square—facing the Chapel.

BUSHELL'S Light Seedling Dahlia "Emma."—Plants in May, 10*s*. 6*d*. Colour white, tipped with deep cherry; the petals, form, and centre, good; the largest, most constant, and free in flowering of any Dahlia yet propagated, and has obtained several prizes. "Pet Rival" Plants in May, 5*s*. Colour, purple maroon; fine cupped petal and free bloomer; exhibited in several winning stands last season. Kennington Rose, Plants in May, 5*s*.; most constant Rose grown. To be had of Messrs. Ansell, Camden Town; S. Girling, Stowmarket; F. and A. Smith, Hackney; and J. Bushell, 12, Hall-place, Kennington-lane.

LARCH PLANTS. — One and two years' transplanted; of good size and quality. On Sale by Dickson and Turnbull, Nurserymen, Brechin. N. B.—Will be sold cheap, and freight paid to London.—Brechin, Feb. 1, 1844.

FRUIT-TREES.—Just arrived, some Dutch Grape-Currant Trees, the fruit of which is very large and fine flavoured, 6*s*. 6*d*. per dozen. Also a very fine large new Gooseberry, 12*s*. per dozen.—H. C. Corsten, 25, Lichfield-st., Soho.

R. WHITE & Co.'s Collection of Plants, of which a Catalogue is now in the press and will be ready in about a week, comprises every variety of Geranium, Fuchsia, Verbena, Chrysanthemum, Dahlia, &c. which is worthy of cultivation. The following collections are offered, the selection being left to the purchaser:—

		£	s.	d.
40	first rate varieties of Geranium	5	0	0
20	,, ,, do.	3	0	0
12	,, ,, New do.	3	0	0
20	,, ,, Fuchsia	1	1	0
40	,, ,, Chrysanthemum	1	1	0
30	,, ,, Verbena, including Seedlings which were submitted to Dr. Lindley for his opinion, and reported to be "all very fine," see *Gardeners' Chronicle*, Sept. 28th and Oct. 7th: "*Alfred*: All your Seedling Verbenas are good flowers."	1	1	0
12	first-rate Dahlias	1	1	0
100	fine show do.	2	10	0

The above will be ready for delivery in strong plants the first weeks of April and May; and orders containing remittances will be executed in strict priority. Orders amounting to 5*l.* will be delivered free.

Agents for the sale of STEPHENSON'S Conical Boiler, Tank, &c., which may be seen at work, and can be supplied at Manufacturers' prices. Also WHITNEY'S Composition Substitute for Glass.—Poole Nursery.

RANUNCULUSES, ANEMONES, CARNATIONS, AURICULAS and LILIUM LANCIFOLIUM.

H. GROOM, Clapham-rise, near London (removed from Walworth), by appointment FLORIST TO HER MAJESTY, begs to remind the Nobility, Gentry, and Amateurs, that this is the best season for obtaining Collections of the above Flowers, and that in consequence of the success he had in their cultivation last year, he can offer them at the following moderate prices:—

		£	s.	d.
100	Ranunculuses in 100 superb sorts with names	4	4	0
100	do. in 100 very fine sorts, do.	2	10	0
	Superfine mixtures, from 7*s.* to 21*s.* per 100.			
100	Anemones in 100 superfine sorts, with names	2	10	0
100	Do. in 50 do. do. do.	2	0	0
	Superfine mixtures, 10*s* per 100.			
25	pair of Carnations, in 25 superfine sorts, with names	3	10	0
25	pair of Picotees, in 25 do. do. do.	2	10	0
25	Auriculas, in 25 superfine sorts, with names	3	13	6
	Lilium lancifolium album, good bulbs, each	0	3	6
,,	,, ,, large bulbs, each	0	10	6
,,	,, punctatum, good bulbs, each	0	7	6
,,	,, ,, large bulbs, each	1	1	0

Catalogues may be had on application.—Jan., 1844.

GEO. CROFT, Forbury, Reading, begs to call particular attention to his Seedling Verbena "ADONIS"—a light crimson, with large lemon-coloured eye. This is particularly recommended to Noblemen and Gentlemen's Gardeners for planting out in beds, as nothing can excel in beauty a bed of this splendid Flower. Plants in April, 3*s.* 6*d.*

Likewise to his Seedling Fuchsia "UNIQUE"—tube and sepals smooth; sepals expand well; corolla, rosy purple: the plant is of beautiful habit, and if the Public can judge, then this is one of the loveliest Fuchsias sent out. Plants in April, 7*s.* 6*d.*

SHILLING'S EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the above PEA, the Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they, with confidence, recommend to the Public generally, being quite as early, and nearly double the size of any other Pea in cultivation. Quite hardy, will stand the winter well, and a good bearer; the pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 3*s.* per quart; 10*s.* per gallon; 17*s* 6*d.* per peck: 30*s.* per half-bushel; 2*l.* 10*s.* per bushel. Agents:—Messrs. FIELD and CHILD, 119, Lower Thames-street, London; Messrs. W. and J. NOBLE, 152, Fleet street; Mr. KERNAN, 4, Great Russell-street, Covent Garden; Messrs. HURST and McMULLEN, 61, Leadenhall-street; Messrs. GRAY, ADAMS, and HOGG, Kensington; Mr. T. D. WATKINSON, Market-place, Manchester.—Northwarnborough Nursery, near Odiham, Hants.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3*s.* 6*d.* each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, &c., begs to inform the readers of the *Gardeners' Chronicle* that they can be supplied with the following Early and Prolific Varieties, viz.: Cormack's Prince Albert, British Queen and Early Kent Peas; Taylor's Improved Windsor, and Johnson's Wonderful Bean; Manchester Red and Seymour's White Celery; Walker's Long and Hamilton's Cucumber, &c, with every other variety of Horticultural and Agricultural Seeds, at his Wholesale and Retail Seed Warehouse, 106, Deansgate, Manchester.

FINE HYBRIDIZED FUCHSIA SEED.

W. MILLER begs to inform his Friends that he has spared no pains in selecting the best kinds of Fuchsia for hybridizing, and now has a few packets of fine seeds to dispose of, in packets containing 100 seeds, 7*s.* 6*d.*; 50 seeds, 4*s.* Fine Verbena seed, in packets at 2*s.* 6*d.* and 5*s.* each, with directions for sowing. W. M.'s extensive list of Fuchsias, Verbenas, Pelargoniums, &c., &c. can be had on application, containing a full description of his new productions, by Dr. LINDLEY, viz.:—"uchsia "Constellation;" Petunia "Punctata;" Verbenas "Blue Queen" and "Zouaves." W. M. has fine plants of his new "Fire Ball" Geranium, at 5*s.* each. The above will be sent post free to any part of the United Kingdom.—Providence Nursery, Ramsgate, Feb. 10, 1844.

CHOICE PANSY SEED.

J. FRYER begs to offer the above at 2*s.* 6*d.*, 5*s.*, and 10*s.* per packet, saved from his superb Collection, which contains the finest varieties in cultivation. Strong healthy plants are now ready for delivery, and Catalogues will be forwarded on application.

THUNBERGIA FRYERII.

Seeds of the above beautiful New Variety of Thunbergia, which was noticed by Dr. LINDLEY in last year's *Chronicle*, and is figured in the Florist's Journal for Dec. last, at 2*s.* 6*d.* and 5*s.* per packet.

NEW FUCHSIAS.

One dozen good Show Varieties, 7*s.* 6*d.*; one dozen very superior, do. 20*s.*

VERBENAS.

One dozen good Show Varieties, 4*s.*; one dozen very superior, ditto, 7*s.* 6*d.*

CARNATIONS AND PICOTEES.

One dozen pair of good Show Varieties, 18*s.*; one dozen pair of very superior do., 30*s.* Good healthy plants of any of the above will be sent by Post free, on the receipt of a Post-office order.—Clarendon Nursery, Camberwell, London, Feb. 9, 1844.

DEATH OF MR. LOUDON.

THE SUDDEN DEATH OF MR. LOUDON has involved his family in the deepest distress in every sense of the word; for although he laboured most incessantly, nearly day and night, for the space of forty years, and his works had an extensive sale—yet, from the circumstance of his being an invalid for years, and the expensive nature of the illustrations to his Works, he died considerably indebted to the Printers and Engravers; the greater part of this debt was incurred in producing the most valuable, perhaps, of all Mr. LOUDON's Works, namely, the "Arboretum Britannicum" a work which alone is sufficient to stamp his fame as an author.

After much consideration, it was decided that the best means of providing for his family (and a means, too, strictly in keeping with the independent spirit which characterised the life of Mr. LOUDON, would be by promoting the sale of his truly valuable Publications. There is a large stock on hand of the following Works, the sale of which would extricate the family from their present embarrassed state, by enabling Mrs. LOUDON to discharge the debt, and reserve the copyrights in her own hands as a means of future support; and it is earnestly hoped that every person who respects the memory of the late MR. LOUDON, will exert himself by soliciting his friends to become subscribers for the Publications enumerated below:—

Published in July, 1838, Price 10*l.*, cloth lettered,

THE ARBORETUM ET FRUTICETUM BRITANNICUM;

In Eight volumes: Four of Letterpress illustrated by above 2500 Engravings, and Four of octavo and quarto Plates.

Just published, complete in One Volume, Price 2*l.* 10*s.*, and in Ten Parts at 5*s.* each,

AN ENCYCLOPÆDIA OF TREES AND SHRUBS;

Being the ARBORETUM ET FRUTICETUM BRITANNICUM ABRIDGED: for the Use of Nurserymen, Gardeners, and Foresters.

Published October 1, 1839, in One Volume, octavo, with upwards of 250 Engravings, Price 1*l.* 10*s.*, and 3*l.* 6*s.*, coloured,

REPTON'S LANDSCAPE-GARDENING;

Being the whole Works on Landscape-Gardening and Landscape-Architecture of the late HUMPHRY REPTON, Esq.; with a Biographical Notice, and Notes by J. C. LOUDON, F.L.S., &c.

Published August 1, 1838, in One Volume, octavo, numerous Engravings, Price 20*s.*,

THE SUBURBAN GARDENER AND VILLA COMPANION;

Comprising the Choice of a Suburban or Villa Residence, or of a Situation on which to form one; the Arrangement and Furnishing of the House; and the Laying-out, Planting, and general Management of the Garden and Grounds; the whole adapted for Grounds from One Perch to Fifty Acres and upwards in Extent; and intended for the instruction of those who know little of Gardening and Rural Affairs.

Published November 1, 1842, in One Volume, octavo, with upwards of 380 Engravings, Price 16*s.*

THE SUBURBAN HORTICULTURIST;

Or, an Attempt to teach the Science of Horticulture, and the Management of the Fruit, Kitchen, and Forcing Gardens, to Persons who have had no previous Knowledge or Experience in these Departments.

THE GARDENER'S MAGAZINE;

Any Number or Volume published subsequently to 1834 may be purchased separately: The Second Series, consisting of Six Volumes, from 1835 to 1840 inclusive, for 6*l.* 8*s.* 6*d.*; for 1841, 1*l.* 1*s.* 6*d.*; for 1842, 1*l.* 2*s.*; and for 1843, 1*l.* 5*s.*; or the third Series complete in 9 vols., 9*l.*

By a Post Office order being sent to Mrs. LOUDON, Bayswater, London, any of Mr. LOUDON's works will be forwarded in the monthly parcel of any local Bookseller; or through any Nurseryman or Seedsman in the neighbourhood of London. A list of the subscribers' names will appear weekly in the *Gardeners' Chronicle*.

A Public Meeting for the benevolent purpose of promoting the sale of these works will be held in the rooms of the Horticultural Society, Regent-street, London, by the kind permission of the Council, on SATURDAY next, the 17th, at two o'clock precisely, when it is hoped all persons taking an interest in Gardening, who are within a reasonable distance, will attend.

On the 1st December, 1843, exactly a fortnight previous to Mr. LOUDON's lamented death, he published the following statement:—

"The *Arboretum Britannicum* was got up between the years 1833 and 1838, and published on Mr. LOUDON's own account, at an expense of upwards of 10,000*l.*; the greater part of this sum was owing at the completion of the work, but it sold so well, till the late depression of the book trade in 1841, that only about 2,600*l.* of the debt remained to be paid off at the end of that year. It is, however, necessary to observe that this large proportion of the debt was not paid off solely by the produce of the *Arboretum*, but in part by the profits of Mr. LOUDON's other literary property, consisting of thirteen different publications, all of which stand pledged in the hands of his publishers, Messrs. Longman, for the debt due to others on the *Arboretum*. This debt, at the present time, amounts to about 2,400*l.*; and hence, if 350 additional Subscribers could be got, the debt would be at once liquidated, the works pledged for it set free, and Mr. LOUDON or his family would enjoy the whole produce of his literary property.*

"This Appeal would never have been made, had not Mr. LOUDON, who has been an invalid for several years, been lately seized with an inflammation of the lungs, terminating in chronic bronchites, which, even if the disease should be considerably alleviated, will effectually prevent him from any longer pursuing his profession of landscape-gardener, on the produce of which profession, and on the literary labours of Mrs. LOUDON, he has entirely depended for his income, since his literary property was pledged for the *Arboretum*. Under these circumstances Mr. LOUDON feels himself justified in taking this mode of soliciting additional Subscribers to the *Arboretum*, and in begging his Friends and Patrons throughout the country to assist him in obtaining them.

"The *Arboretum* has been spoken of in the highest terms in all the principal Reviews of Europe, and in the Botanical Periodicals of North America. The *Quarterly Review* says:—

"'This book is one of solid value, worthy of a place in the Library of every landed gentleman, as well as of every student of Botanical, Arboricultural, and Horticultural science . . . Let us warmly congratulate Mr. Loudon on having finished his Herculean task; a task which few men, except himself, would have had the courage to begin, and still fewer the perseverance to complete. The *Arboretum Britannicum* is complete in its kind, and it must become a standard book of reference on all subjects connected with trees'—Oct. 1838."

The following Ladies, Noblemen, and Gentlemen, who already possess the work, on being applied to, have kindly permitted their names to be published as approving of the *Arboretum*, and of this Address to the Public:—

* It may be thought from the well-known extensive sale, for the last 20 years, of Mr. LOUDON's Publications that he ought now to be independent: in consequence of too intense application while compiling the *Encyclopædia of Gardening*, Mr. LOUDON fell into ill health in 1821, which obliged him ultimately to have his right arm amputated, his left hand being at the same time so much injured as to leave him with only the partial use of two fingers, and his left knee being anchylosed. In consequence of these bodily infirmities, Mr. LOUDON has been obliged to keep an amanuensis and a draughtsman for the last twenty years, and also, during the greater part of that time, a servant to act as valet. Had it not been for the expenses thus incurred, and for others arising from the same source, Mr. LOUDON might have been now independent, even without his literary property. This explanation is due to those who are ignorant of Mr. LOUDON's personal character.

The following Subscribers to the Works of the late Mr. LOUDON have been obtained since making up the Subscription List which appeared in the *Gardeners' Chronicle* of Saturday last:—

ARBORETUM BRITANNICUM.—10*l.*

Henry Alexander Brown, Esq. London
P. Chalmers, Esq., Auldbar
Thomas Lombe Taylor, Esq., Starston
Earl Fortescue
John Perceval, Esq., Woodlands, Ryde
The Earl of Burlington
Joseph Ablett, Esq., Llanbedr Hall

ENCYCLOPÆDIA OF TREES AND SHRUBS.—50*s.*

Joseph Hume, Esq., M.P.
Wm. Hewetson, Esq., Knightsbridge
Lady Webster
Lord Howden
The Rev. E. Trollope, Lessingham
Mr. Hopwood, Bayswater
Lord De Tabley
Lord Viscount Canning
Mr. John Lamb, Markeaton, Derby
Mr. Wheeler, Warminster

THE SUBURBAN GARDENER.—1*l.*

John Baring, Esq., Oakwood
Messrs. Rattle and Brine, Bath
Mr. Hopgood, Bayswater
H. P. Cotton, Esq., Holland House, Margate

THE SUBURBAN HORTICULTURIST.—16*s.*

Mr. Frederick Ashby, Staines
Mr. W. E. Rendle, Plymouth
Wm. Hewetson, Esq., Knightsbridge
Alexander Rowland, Esq., Lewisham
Mr. Hopgood, Bayswater
Mr. C. Hale Jessop, Cheltenham

REPTON'S LANDSCAPE-GARDENING, Plain.—30*s.*

Wm. Hewetson, Esq., Knightsbridge
P. Chalmers, Esq., Auldbar
Messrs. Garaway, Mayes and Co., Bristol
Mr. C. Hale Jessop, Cheltenham

REPTON'S LANDSCAPE-GARDENING, Coloured.—66*s.*

Messrs. Rattle & Brine, Bath
Professor Daubeny, Oxford
Mr. Wheeler, Warminster

WATERTON'S ESSAYS ON NATURAL HISTORY.—8*s.*

John Baring, Esq., Oakwood
Alex. Rowland, Esq., Lewisham

THE GARDENERS' MAGAZINE, 9 Vols.—9*l.* 17*s.*

Mr. John Lamb, Markeaton, Derby; the Vol. for 1843.

TO GENTLEMEN AND OTHERS ENGAGED IN PLANTING.

MESSRS. PROTHEROE and MORRIS are instructed by the Proprietors to submit to public competition, in consequence of the expiration of lease, on MONDAY, MARCH 4, 1844, and following days, at 11 o'Clock, THE STOCK OF ONE OF THE KENSINGTON NURSERIES, next the Great West Road, consisting of large, healthy, and well-grown Specimens of Ornamental Trees and Shrubs, of every description, Variegated and Green Hollies, Evergreen Oaks, and Cork trees, Large Fan and other Yews, twice-transplanted Common and Portugal Laurels, Arbutus, Alaternus, &c., Hemlock Spruce, Pinus Laricio, P. austriaca, and nigricans, &c. &c. These Grounds have long been celebrated for the Health and Beauty of their Trees and Shrubs, and safety of removal, and well worth the attention of those Gentlemen who intend Planting in the spring. American Nursery, Leytonstone.

THE KENSINGTON NURSERIES AND THE BROMPTON PARK NURSERY, KENSINGTON GORE, having been so long and distinctively known by their respective names, in these Kingdoms, that we hardly thought it possible that one could be taken for the other; our reason for advertising as we did was in contradistinction from the other extensive and well-stocked Nurseries in the possession of Messrs. FORREST & Co. The one in question being the smallest of their Nurseries, and as the lease expires shortly, it is expected that a great part will go for building purposes. This is the cause of the Sale. Messrs. PROTHEROE and MORRIS hope this explanation will allay the fears of Messrs. GRAY, ADAMS, and HOGG.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition at the Auction Mart, Bartholomew Lane, on THURSDAY, February 29th, 1844, at 12 o'Clock, about THREE HUNDRED DOUBLE CAMELLIAS, consisting of the best varieties, beautifully furnished with bloom buds. Also a fine assortment of STANDARD and DWARF ROSES, choice DAHLIAS in dry roots, &c.

May be viewed the morning of Sale; Catalogues may be had at the Mart; of the Auctioneers, American Nursery, Leytonstone.

VALUABLE NURSERY STOCK, IVER HEATH, BUCKS.

MESSRS. SEDGWICK AND SON have received Instructions to Sell by Auction, on the Premises, near the Crooked Billet, on Iver Heath, on Monday, February 12, at Eleven, in convenient Lots,

About 2000 fine PORTUGAL and other LAURELS from 1 to 8 feet, a very large and choice collection of standard and dwarf Apple, Pear, and Cherry trees; some very handsome Yew plants of good growth, Larch, Spruce, and Scotch Firs; seedling Oak and other Forest trees, plain and variegated Box, Arbutus, Privet, Laburnums, Scarlet Thorn, Lilacs, Roses, &c. &c. &c., in the Nursery adjoining the road leading from Uxbridge to Langley.

May be viewed four days prior to the sale (Sunday excepted), when catalogues may be had at the Crooked Billet, Iver Heath; at the principal Inns in the neighbourhood; at the King's Arms Inn, Oxford-street, London; and of Messrs. SEDGWICK and SON, land and timber surveyors and estate agents, Rickmansworth.

FUCHSIAS, VERBENAS, PETUNIAS, AND ANAGALLIS.

YOUELL & Co. beg to announce that their Catalogue of the above, with prices, will appear in the *Gardeners' Chronicle* of next week. It will be found to contain every novelty and variety worthy of cultivation, and is particularly recommended to those selecting for the ensuing season.—Great Yarmouth Nursery, Feb. 8, 1844.

RENDLE'S TANK SYSTEM of HEATING. Second Edition.—A few copies only remain unsold in the hands of the Publishers and Author.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 10, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Feb. 14	Society of Arts	8 P.M.
THURSDAY, Feb. 15	Microscopical	7 P.M.
TUESDAY, Feb. 20	Horticultural	2 P.M.
	Linnean	8 P.M.

THERE is considerable difficulty to be overcome in any attempt to teach LANDSCAPE GARDENING as an art; because it is scarcely a thing to be taught, in the common acceptation of the term, but rather a thing to be sought for and brought out. There must be an inward impulse in the pupil; a quick perception of form, colour, and relative position; of magnitude; and of the harmony of things in general; and all this is no less necessary in the teacher. Besides, according to our idea, Landscape Gardening is not a thing to be taught, even to those possessing the necessary talent, without a direct appeal to Nature.

A certain amount of materials is given to be worked upon, and the question is how to make the most of it. But unless the materials be present to our senses, it is impossible to point out the various means by which they may be made available to the utmost extent. We have the dead flat — the undulating surface — the hilly, the mountainous, and rocky country, and endless mixtures and modifications of these, and of land and water. We have not merely one window to look from, but many, having various aspects; and innumerable points of view out of doors, to consider. The matter which requires the greatest skill is to contrive to make one thing serve many purposes—one tree or bush to fall in with advantage to many points of view. It will be asked who is to judge of the propriety of arrangements suggested by a teacher? How is a pupil to know and feel that his master has good taste? It is obvious that the arrangements, when made, indicate the taste of only one individual in the first instance, and that the result of his labour can be valued only by those who are similarly constituted by Nature; so that it is possible the pupil may despise the taste of his master, justly or unjustly. Fortunately, those who have no generality of taste, so to speak, learning from others that such and such things are admired, get into a habit of taking for granted that all similar, or nearly similar things are to be admired; that every domain belonging to a Peer or wealthy Commoner must be magnificent; that wherever big trees stand—wherever there is water, still or noisy—wherever rocks and hills—extasy ought to be expressed; and thus the multitude comes to believe itself pleased and delighted, and the owner of the fine things chuckles at the thought of his being lord over all.

We have seen (according to our own notions) very good artificial landscapes made out of indifferent subjects, and tolerable subjects made hideous by attempts at embellishment. We have seen admirable subjects spoiled, others rendered splendid. Though we have had to deal with some of the best subjects in Nature, and found our work admired (whether the admiration was real or feigned matters not), we are not so conceited, nor so ignorant of the constitution of human nature, as to set our taste up as a standard. We have often had to revise our own work, and to make corrections and additions; and some painful necessity has occurred to us in our time (which has not been very short)—such as that of felling a fine tree, because, though, while young, it performed an important part, it had grown too large for its station in the landscape.

We have said enough, perhaps, to show that what is called Landscape-Gardening cannot be taught in the closet; and, though rules have been laid down on paper, that they cannot be applied with any degree of certainty. *Poeta nascitur, non fit.* So must it be with a landscape-gardener. We do not affirm that the profession is not needed; it is a useful one, provided he that practises the art has a love for it. It requires more various talent than almost any other profession; and were we to appeal to a Phrenologist, he would probably enumerate more than half-a-dozen faculties which would have to be in a state of strength and activity. A young person inclined to follow the profession should be taken to see Nature in all her aspects, and from her he should take all his lessons: for this reason, that the Creator has adapted Nature to make agreeable impressions on our faculties, as well as to excite some emotions which warn us of danger, and others which rouse wonder, awe, and gratitude to their Author. He should draw well, so as to be able to accumulate examples, which he may transfer, as his judgment may direct, to any portion of country he may be called upon to adorn. It is a duty to the public to be performed by every proprietor of land who is conscious he does not possess talent for rendering a district agreeable to the eye, to look out for some one who does possess it, and whose assistance he should require. We can only advise those who have country residences and good talent to look well about them, and to direct operations themselves. Unhappily, we cannot exhort against self-conceit, which is too often present, and in the way of talent. Happily, we have in our country the display of a vast amount of fine taste. Good examples are so numerous in every style, that no one need travel far to find them. One thing, however, has often annoyed us—viz., the shutting out of beautiful views by plantations along the highways: there should be an Act of Parliament against this.

Architecture is, in an intimate degree, connected with Landscape-Gardening. Into this department, however, we do not wish to venture far. We may remark that style should be adapted to situation, and also to what is sadly neglected—to time. It is surely incorrect to associate our peaceful days with strong towers and battlements—with the appearance of defences against weapons no longer in use, and which the meanest of the modern implements of war could prostrate in a moment. Still more preposterous is it to connect such things with modern windows, and every means of easy access. Modern architecture has run wild in attempting to mix different styles, and to accommodate them to each other. Fancy has extended her skill to the abodes of the brute creation, and rendered them as classical as those of men. Not having been rich enough to build more than a cottage on a large scale, we felt, on approaching our rather pretty domain with a stranger, somewhat queer when he asked, "Are these your stables?" Not a word was said of the fine landscape that burst upon his view. Nevertheless, our friend got reconciled to the accommodation afforded to him in the supposed stables; and so we had to thank him for giving us an additional example of variety in human idea and human perception. We decline going farther into this part of the subject, which looks too like a labyrinth; and we have no desire to be the cause of our kind readers losing themselves.—*G.*

How best to PRESERVE THE VITALITY OF SEEDS in long sea-voyages is one of those problems which experience alone can solve, but which is of such very great importance that it has already received some attention at our hands (p. 787, for 1843). Lately, a new idea has occurred to Mr. James M'Gall, a young man who was sent out to the Bermudas a few years ago as gardener, and who is now in the employment of Colonel Reid, the Governor, to whom we are indebted for his observations.

In the Bermudas there are sudden and violent changes of climate, caused by the dry winds of the north shifting to hot southerly winds, bringing an atmosphere loaded with moisture. In consequence of this there is a great difficulty in preserving seeds, which, although they spring luxuriantly before the middle of summer, immediately afterwards lose their germinating power.

Bottles carefully sealed, and thick brown-paper packages are generally employed for their preservation, and are kept in a cool and well-aired room. But although this preserves them very well from insects, yet the advantage does not appear to extend further. In the beginning of May last, Mr. M'Gall was induced, from the evenness of the temperature there, to put a bottle of Onion-seed, carefully sealed, which had arrived at Bermuda from Madeira in the beginning of February, into the bottom of a cistern of rain-water five feet below the surface of the earth. The cistern was cased with Roman cement, and had a free circulation of air above the cement, about seven feet from the bottom. On the 1st of November, about the usual time of sowing, this bottle was taken out and its contents sown, together with those of four other bottles of the same package, which had been kept in a cool warehouse during the summer, and of three others. In all cases the seed came up more or less; that in some of the bottles to the extent of about a fifth part, others of about a tenth, but in some scarcely at all. The seed, however, which had been kept under water came up regularly, and four or five days sooner than the others; the plants were strong, and not more than a fifth part of the seed failed. The seed in three of the bottles looked pale when opened, and several seeds were chipped or broken; the fourth bottle, in comparison with that taken out of the water, seemed equally fresh, though very few seeds sprung. It is no doubt possible that some of the seed was not good when first imported; but be that as it may, the seed kept under water came up as quickly as new seed.

This is a new, and we think an important fact; because, if further experiments confirm Mr. M'Gall's experience, it may possibly be found that the best plan for seeds on board ships bound to distant countries, is, as Col. Reid has suggested to us, in bottles plunged in ships' tanks, where they may be exposed to a more uniform temperature than can be otherwise secured.

We throw this out for the consideration of the importers of seeds.

BEES.—No. VI.

(*Continued from p. 69.*)

The Pasturage of Bees, and the Transporting of them to it.—Some counties abound in honey more than others. The three counties, Lanark, Ayr, and Middlesex, in which we have lived, are "flowing with honey." Other counties may be compared with these. Bees will thrive where most of the following plants are found:—Sallows, Gooseberries, Plums, Apples, Pears, Planes, Limes, Furze, Broom, Field Mustard (Sinapis arvensis), common Bird's-foot Trefoil (Lotus corniculatus), greater Bird's-foot Trefoil (Lotus major), Beans, Dutch (white) Clover, Ling (Calluna vulgaris), and Devil's-bit Scabious (Scabiosa succisa). There are many more honey-producing plants, but they are either not native, or not allowed to flower extensively in the counties which are mentioned above. If honey-plants do not grow in the immediate vicinity of an Apiary, the Bees therein will not—cannot, gather much honey; for they have not only a greater distance to fly, but are sometimes on their journey overtaken and destroyed by sudden showers. In many parts of Scotland, and I dare say of England too, Bees are transported from one pasturage to another. This cannot be too highly recommended, and I think I cannot do better than mention how, when, and whither, the Bees at Carluke are removed. Carluke is situated three miles north of the Clyde, which runs through the centre, and drains the greater part of Lanarkshire. About three miles to the north-east of the village there is a large track of land densely covered with Ling, or Heather, as it is there called. About the 1st of March the stock-hives are removed on very light hand-barrows to the banks of the Clyde, which abound with Sallows, Gooseberries, Plums, &c. At the swarming season many are taken back to Carluke, and from the 1st to 12th of August all are removed to the Heather. In removing Bees it is necessary to ventilate the hives by raising them off the boards with thin wedges or penny-pieces, and by placing hair-combs or pieces of perforated tin on their mouths. Those Bee-keepers who say that ventilation is necessary at any other time do not know much about the habits of the Honey-bee. Wm. Pettigrew's best top swarms gathered, as we have heard, 50 lbs. each in the month of August last year; that is to say, while they were on the Heather. In answer to a question, he says—"I do not believe that they would have gathered 20 lbs. if they had not been taken to the Heather." And in a letter of Sept. 12, 1843, he says—"A friend has a hive that gathered 15lbs. on the 5th, 6th, and 7th of this month: and during the last seven days one belonging to another person gathered about 28 lbs. or 30 lbs." None of mine have gathered so much—only one has gathered 22 lbs. during the same time. The honey is now mostly collected from the Blueheads (Devil's-bit), which are not very plentiful where my hives are; but I will remove a few of them on the first opportunity. The month of August this year was unfavourable here; but I never saw Bees collecting honey in quantity so far in September before this year." In unpropitious or rainy seasons, hilly and exposed pastures are best for Bees—there they will collect honey; whereas, if placed in a valley or sheltered situation, they eat what they have collected, or what is given to them. It may be interesting to gardeners to know that flowers give or contain the greatest quantity of honey when the wind blows from any point between south and west inclusive. This will not appear strange to those who have paid attention to what is said in the third chapter of the second Book of "Lindley's Theory of Horticulture."*—*A. Pettigrew, Wretham Park, Middlesex.*

(*To be continued.*)

A KNOWLEDGE OF PRINCIPLES ESSENTIAL TO THE BEST CULTIVATION.—No. I.

As the cultivation of plants in pots admits but a limited amount of material for their growth, it may be inferred that any system involving such a restriction, and consequent exposure to extreme fluctuations of temperature, can only be productive of a partial effect, compared with their condition in a state of nature. At p. 876, 1843, it is stated that "Nature has given plants the power (under favourable circumstances) of producing from the bosom of each leaf a branch, which is capable of being rendered subservient to the formation of bloom; and that the proportion of bloom will, as a general rule, be in proportion to the multiplication of such branches, subject to their being produced within a given period prior to the season of bloom, and being duly exposed to the agencies which are essential to maturity of growth."

Assuming the correctness of these conditions, the following inferences are drawn:—

1st, That perfect cultivation necessarily involves the greatest extent and vigour of growth of which plants are capable;

2dly, That such a growth is the only test of their average proportions in a state of fertility;

3dly, That maturity of growth should, as a general rule, be antecedent to, or uniform with, a development of bloom.

---

* Though this book cannot well be overvalued or too highly recommended, yet it is scarcely to be found in the libraries of journeymen gardeners. To such it is confessedly the best book on gardening in the English language. I hope this notice of the work will induce many young men to purchase and peruse it.

The absence of fertility in plants, generally, may be attributed to an imperfect application of the agencies (whether in excess or deficiency) which are essential to its formation. The following case will illustrate this:—Two years ago the writer forwarded a duplicate of the beautiful Leonotis Leonurus to an eminent cultivator, and in the autumn the same cultivator thus writes: "I have Leonotis in splendid growth, and also Fuchsia corymbiflora, the latter 10 feet high, but without any appearance of bloom on either; what is the cause?" The reply was—"Both are attributable to one cause, viz., an undue excitement, either by organic or atmospheric stimulants, thereby causing an excess of growth beyond the season of bloom."

What Dr. Johnson has well observed in respect to human nature, that it "is everywhere made to furnish the machinery which may work most effectually upon itself," may be equally applied to plants,—that they, too, (when understood in the relation which their organic structure bears to the agencies which sustain them,) best afford the knowledge which may most effectually be rendered subservient to their perfect culture.

In accordance with these views, a principle is given at p. 757, 1843, as follows: An accurate acquaintance with the physiological or organic structure of plants is of essential importance to a knowledge of the nature, extent, and application of the agencies which sustain them.

Every fact, whether derived from observation, analogy, or practice, favours this conclusion. If our present knowledge has put us in possession of the means of approaching more perfect growth in any department of Gardening, it only remains that the conditions which operate upon the productive organs of plants throughout their respective stages of growth should be duly applied, to render such growth subservient to its ultimate object of fertility.

As "every leaf-bud has its own distinct system of life and growth," and also, as every plant is individually "a collection of a great number of distinct identical systems of life,"* it follows that a system of cultivation is perfect, in proportion to its capability of causing a development of the greatest number of leaf-buds into branches, and *vice versâ*.

Again, by the laws which govern the productive organs of plants, "all flower-buds are analogous to leaf-buds," and "whatever are the laws of the arrangement of branches, with respect to each other, the same will be the laws of the arrangement of flowers, with respect to each other"†; therefore it may be inferred that as the formation of leaf-buds is a predisposing cause to the production of flower-buds, the most perfect system of cultivation will be that which produces the greatest number of systems of life (in the highest vigour), by the production of leaf-buds, subservient to the formation of bloom.

One of the most common errors as regards the formation of bloom in plants, is a notion that they must be necessarily restricted in the proportion of soil, or size of the pot in which they are grown; this mistake is founded on a forgetfulness of the various abilities of cultivators, the skill of whom may so far differ that in one case a plant may be so treated as to require the space of a 16-sized pot, whilst, by inferior management in other hands, a similar plant might not occupy more than a 32. A plant in a 16 or 12 pot may be as effectually restricted (as regards the unfolding its bloom) as another in a 48, if the growth, in both cases, be produced by a given period prior to the season of bloom.—*William Wood, Pine-Apple Place.*

(*To be continued.*)

THE ROSE GARDEN.—No. IV.

(*Continued from page* 68.)

The most promising plant to be taken for budding upon, provided size can be obtained, is a well-ripened and woody sucker of the present year, whose root will almost always admit of being trimmed and placed within a plunged pot, for the purpose of avoiding a check on the subsequent removal of the plant when become ornamental. Next to this (if not equal to it), a plant of the preceding year is to be preferred for the same reasons and with the same advantages. For free growers, however, stocks of the 2d or 3d year should be preferred, as less likely to be cut off by frost, and being also more capable of self-support. There seems a question, also, if these be not more vigorous, care being taken when worked that the buds entered are neither sluggish nor delicate in their habit of growth; such buds should invariably be entered upon young and succulent stocks.

In choosing young and rather slight stems, care should be taken to select such plants as are woody, and tolerably able to support themselves and defy the frost; these should be sought amongst the shoots of grey, brown and green, or rather grey and green striped, which eventually run to a large size, and are particularly clean and healthy in appearance; and green suckers from them may be readily obtained of good size, and of the height of ten or twelve feet. Without this precaution there is some danger of an unexperienced person mistaking the small for the large sorts, and the quantity of pith some of the former contain, render them liable to rot down, on accidental exposure of wounds, &c., and their general want of vigour makes the possession of them undesirable.

There are two varieties of the Wild Rose more peculiarly unfit for working, both suffruticose or half-shrubby, and both slight in the stem; the one grows upon a most prolific root, which throws up innumerable suckers, looking almost like a tuft of Rushes, and as far as the number of plants to be obtained by the division of one stool may go, a most desirable prize to the collector; the other similar in colour and pithiness; but whereas the first is dwarf and bushy, the second produces few suckers and climbs to the height of 20 ft. or more, but neither of them are adapted for standards.

a A stock of the Wild Briar as brought from the hedge.

b The same stem, the roots and head having been trimmed for planting.

c Another plant, with younger and more fibrous roots; the dotted line indicating the passage of the saw in the removal of superfluous wood.

d The stock B., with the shoots made during the summer, and the buds entered in August.

1. The branches shortened in November.

2. The branches cut back to the sap-buds in spring.

e The same plant the succeeding summer; one bud having failed, the branch has been cut away, and the other buds are figured as flowering.

f A side-shoot of the Wild Briar, with an inserted bud, previous to its opening; the sap-bud above it being on the eve of breaking.

A plant is not to be rejected on account of its age, as unconnected with its appearance, youth being by no means a *sine quâ non* in the collection of stocks. A sucker just ripe and a plant in its third season frequently proving equally vigorous after transplantation; but one thing must be attended to, viz., that the stocks be free from side-shoots, the removal of which mangle the stem and spoil the appearance of the future tree; but if these be unavoidable, care should be taken to remove the branch desired, by a clean cut quite to its base.

The Wild Rose displays so much variety in its mode of growth, colour of bark, shape of stem, formation of root, &c., that any attempt to convey an adequate idea of these by figuring, would alter the nature and intention of this work entirely. The accompanying engraving will give a distinct idea of the plant in its progressive stages; the frontispiece being intended to represent its completion.

FAMILIAR BOTANY.

Morphology.—No. II.

Ὅδε τῶν φυλλων μετασχηματισμος και ἑτερων χαινος· ἐκει γας τα τῶ κεροτῶνος, ἑνια περιφερῆ φυομενα την ἀρχην, ὕστερον ἀπογυμνοῦσθαι καθαπερ ἀναδιαφευμενα. τοῦτο δε ΟΤΙ ΡΑΔΙΟΝ ΤΟ ΑΠΑΟΤΗ Η ΤΟ ΠΟΛΤΕΙΔΕΣ. ΑΣΘΕΝΗΣ ΔΕ Η ΑΡΧΗ.—*Theophrastus de Caussis Plantarum* II. 2.

Principium florum et foliorum idem est.—*Linnæus.*

When the Greek philosopher declared that nature always proceeds from imperfection to perfection, he is thought to have distinctly announced the principles upon which Morphology depends. There is not, however, such further evidence in what remains of the works of Aristotle, as entirely justifies our admitting more than the existence in his mind of some perception of its truths. It is his pupil, Theophrastus, who has distinctly shown in the words above quoted, that by him, at least, the order of formation in plants was clearly appreciated, and that complicated forms are in all cases, and of necessity, the result of simple forms. "The common transformations of leaves and other things is manifest. In the Croton leaf, for instance, some which grow round in the beginning, afterwards become angular, as if completing themselves. For simplicity is easier than what is complicated. The beginning is strengthless." To be sure it is. Infancy is weak, whether in the structure of the globe, or the organs of plants, or the fabric of man. It was only as strength was gained, and power acquired, that gaseous emanations were consolidated into rocks in the creation of this planet. It was only as the climate of our earth became fully adjusted that the simple forms of plants and animals were increased by the addition of mammals, trees, and highest beings. The insect is still feeble in the grub, the bird in the egg, the quadruped in the fœtus, and the plant in its seed. All by degrees clothe themselves with organs, having a common origin, but mere attempts at structure in the beginning; and all, by gradual changes of the elemental forms of organisation, rise into perfection. In every case *the beginning is strengthless.*

The high philosophy of the Greeks expired with their so-called liberty, and fell into a slumber of nearly 2000 years. It was not till the sixteenth century that the great views of the school of Aristotle met with men capable of comprehending them, and more than two centuries again elapsed ere their doctrines began to assume a definite form. In 1583 Cæsalpinus, an Italian Botanist, spoke of the origin of the parts of plants, and alluded obscurely to the common origin of them all; but it was reserved for Linnæus to give life and reality to the far-seeing doctrines of the Greeks. In the year 1759, he maintained that all the organs of plants are of the nature of leaves, and that the various floral organs are only so many *anticipations of foliage*; that is to say, leaves that have not time enough to grow into their proper form. The year after he published his famous "Prolepsis Plantarum," in which he explains his theory in ample detail. Let us see what he says:—

"As soon as leaves have expanded themselves in spring, a bud is observable in the axil of each. This bud swells as the year advances, and in time becomes manifestly composed of little scales: in the autumn the leaves fall off, but the bud remains; and in the succeeding spring swells, disengages itself from its envelopes, and becomes lengthened: when its outer scales have dried up and fallen off, the inner ones are expanded into leaves (like the wings of a butterfly emerging from its pupa), which separate from each other by means of a gradual extension of the young branch, and presently each new leaf is found to contain in its bosom a little scaly bud, which, in the following season, will also be developed as a branch, with other leaves and other buds. Now, when I see a tree adorned with leaves, and in the bosom of those leaves provided with its little buds, it is natural to inquire, of what do these buds consist? Do they consist of the rudiments of leaves with their gemmules, the latter of other leaves and buds, and so on to infinity, or, at least, as far as the extension of the plant is likely to proceed? Nature organises living beings out of such minute particles, and even from fluids themselves, that the best eye may in vain seek to penetrate far into her mysteries."

"If a plant, which has flowered and fruited for many successive years in a pot, is transferred to a rich soil and warmer station, it breaks forth into branches instead of flowers. Hence it appears that branches and leaves can be produced from the provision made for flowers, provided circumstances are favourable to their developement."

"As to *bracts*, 'the bulbs of Hyacinths and Ornithogalums afford good evidence of their nature. Both bulbs and buds are winter coverings of plants, with this difference, that bulbs are the bases of leaves of the previous year, while buds are the rudiments of leaves of a coming year. Wherever bulbs grow, there are formed the persistent bases of leaves, within which young leaves are to be developed: within these latter leaves repose the buds or rudiments of future plants, exactly the same as the buds of trees. These buds consist of the rudiments of leaves of the succeeding year; small indeed, but containing in their axils other

* "Principles of Horticulture," p. 112, 113.
† Lindley's "Principles of Botany."

rudiments of a like nature. Now, if it happens that such a plant flowers, the bud, which would otherwise have produced leaves the year after, is converted into a scape a year earlier; whence it comes to pass that the rudimentary leaves lying in the bud lose a part of their nutriment, in consequence of the sap being drawn off to the fructification: wherefore those leaves continue small, assume a different structure, easily wither, and are called by botanists bracts. Thus bracts are nothing but leaves which would have been developed another year if the plant had not flowered.'

"As to the *calyx*. 'That the calyx is only the approximated leaves of a plant, is apparent from several instances. The calyxes of Pyrus and Mespilus are often expanded into perfect leaves; the Rose offers a similar instance of the change. The leaves of Mesembryanthemum barbatum are supplied with a most curious apparatus of hairs; and the calyx consists of five pieces, in all respects similar to the leaves of the stem. The calycine leaves, indeed, are often very small, juiceless, and different from those of the stem, as if scales of buds previous to their developement; but that they still are nothing but leaves of the same nature as those of the stem, must be concluded from this, that when plants, Roses and Geum rivale for example, become, in consequence of excessive nutriment, proliferous, the calycine leaves, which before were small and dry, expand into leaves in size, colour, figure, texture, and substance, exactly like those of the stem. Hence it is not to be doubted that the calyx and the leaves of the stem were in the beginning alike.'

"As to the *petals*. 'It is often very difficult to distinguish them from the calyx. The white corolla of Helleborus niger, after flowering, assumes the green appearance of the calyx. In luxuriant flowers of Rosa and Geum, the corolla sometimes becomes wholly green, and assumes the foliaceous nature of the calyx. As the calyx is nothing but leaves, and as each leaf contains in its axil the rudiment of a plant consisting of the rudiments of leaves of a future year, it follows that the petals are of necessity the rudiment immediately within the calycine leaves; the petals, therefore, would have been leaves another year, if flowers had not been produced.'

"As to the *stamens*. 'From double flowers it is apparent that stamens do change into petals and petals into calyx. This is so well known that it need not be insisted on. Now, as from the axil of every leaf arises the rudiment of a plant, and from the axil of the calyx are produced the petals, which are nothing but more tender leaves, and as these petals must have, like other leaves, the rudiments of leaves in their axils, it follows that stamens are so, for they can be transmuted into petals, as the petals can into the leaves of the calyx.'

As to the *pistil*. The evidence of this being also reducible to leaves, is taken from a change observed in the flowers of Carduus heterophyllus and tataricus, in which the style was changed into two green leaves like bracts, and from the common conversion of the pistil into leaves in proliferous individuals of the Rose, the Anemone, and others.

This is enough to show in what way the great Linnæus regarded this curious question. I shall next explain how others have improved upon his views.—*R. E.*

THE MISTLETOE.

In the days of the Druids, this parasitical plant was supposed to have its attachment principally to the Oak-tree. The Celtic priests regarded it with extreme veneration, and collected it for charms, and cures, and religious ceremonies, with solemn formalities; but with them it owed all its supposed mystic influences to its connexion with the sacred Oak.

I am led, however, to imagine, from recent inquiries and some personal observation, that we do not know the true Mistletoe of Celtic superstition, and therefore that Pliny, the naturalist, though he was contemporary with the Druids, may have in some way mistaken the plant. He probably took his report on trust. It may not have been a production of his climate, he may have had no opportunity of observing it himself. We know that most of the names given by him and Theophrastus have been rejected by modern botanists, or have been applied to other plants; as the Daphne, which was the Laurel of the Greeks, is not our Laurel. Virgil speaks of the *Viscum*, which we suppose to be the Viscum album—

> Quale solet sylvis brumali frigore viscum
> Fronde virere novâ, quod non sua seminat arbos,
> Et croceo fœtu teretes circumdare truncos;

but without any direct allusion in those lines to the Oak or any particular tree as its nurse, though he certainly refers to the Ilex in the course of his metaphor, a few lines farther.

M. Bataille, the Curator of the Botanical Garden at Avranches, in the Department of La Manche, Normandy, has favoured me with some interesting notes on the subject, which have led me to examine Oak forests, and various plantations in that district, the examination of which tends to corroborate his remarks. He asserts that in all his botanical researches throughout the arrondissement, he has never seen the Mistletoe growing from the Oak, nor been able to discover that any other person had seen it on that tree, though it is common on the Apple-tree, the Hawthorn, and many other of those trees on which the thrush (which is believed to be the agent of propagating the plant) had voided the undigested berries of the Viscum album on which it had been feeding. Thus, by a bountiful provision of the Creator, that matter which otherwise would fall barren to the earth and perish there from want of the peculiar aliment which has been placed in the bark of certain trees for the development and nurture of the vital principle within it, is rendered reproductive. The consideration of the extent of injury which this parasite occasions to the trees which it tends to exhaust, is beside the question under consideration. But we may conclude with Sir John Colbatch, "that this beautiful plant has some important properties, and that it has been designed for further and more important purposes than to feed thrushes, or to be hung up surreptitiously in houses to drive away evil spirits."

The Druids occupied the forests in Normandy and Brittany: if, then, the Mistletoe with which we are now so familiar, and which is naturally growing at this day on the Acacia, the Hawthorn, and the Poplar, in the botanical garden which is under the care of M. Bataille, be the same as that which the Druids venerated, and which is believed to have been the companion of the Oak, how does it happen that the one has since repudiated the other?

M. Bataille states that after consulting the works of many of those botanists who have given the description of the plants of France, he has found that the authority of Duhamel alone is urged to prove that the Mistletoe may be brought to grow indiscriminately on any of the indigenous trees of the country and on many exotics, in opposition to which Thuillier,* who describes this ligneous parasite accurately, says, that it is found on almost all trees except the Oak.†

M. Bataille planted an Apple-tree among the Honeysuckle tribe in the Avranches garden, and in the part of the tree where Mistletoe would be most likely to establish itself, he inserted in the bark some of its berries; these germinated, the radicles stretched out and fastened upon the bark, on which they continued firmly imbedded during the summer and winter without farther apparent progress. It was not until the succeeding spring that they gave any signs of life, in throwing out a few little branches furnished with the elements of leaves.

M. Bataille has repeated experiments of the same kind with Oak, but unsuccessfully. However, he is about to renew them, in the expectation of ascertaining whether it has much disposition to nourish the Viscum album or not. —*Martin Doyle.*

Home Correspondence.

Burnt Clay.—I can fully confirm the statement of Mr. W. Paul, of Cheshunt, which appeared in the last week's *Gardeners' Chronicle*, as to the good effects produced in gardens, where the soil is strong, by the use of burnt clay or marl mixed with the ashes of vegetables and the charred branches of trees. I have had for some time past several of these burning heaps in the environs of my garden, which produce us in succession a very valuable manure; they are easily kept in a state of combustion, and all the care they require is, to cover and surround them occasionally with fresh clay or marl, that they may not burst out into an open flame. My gardener sowed two beds of Onion-seeds of the Globe, James's Keeping, and Strasburg sorts, mixed together, about the 10th of March last, with 1 lb. of seed to each bed. The beds were each of them 18 yards by 12 yards, and one of them was manured with good stable-dung; the other by this mixture of burnt clay and vegetable ashes. The produce of the first did not exceed five bushels of an inferior size, the greater part having been destroyed by the larva of the Onion-fly; whilst that of the latter was 20 bushels of Onions, as large as those imported from Portugal. Another remarkable circumstance is, that the former have not kept well; but the latter are as sound as possible, not a single bulb in the strings showing the least appearance of decay. The same burnt mixture has been applied with equal success in my fruit-garden. I had observed a great decrease in my crop of Apricots for several years past, and upon a careful investigation as to the cause, my gardener and I agreed that it must be owing to the tenacity of the border; we therefore had the old soil removed, and a quantity of this burnt mixture with a little fresh loam substituted for it. My gardener planted the border so renewed with runners of Keen's Seedlings, in rows; they became strong plants by June, when they flowered and produced an abundant crop, and all my Apricot-trees were covered during the summer with well-ripened fruit. I am so fully persuaded of the excellence of this kind of manure, that I intend to adopt it generally on my farm. It will there have a double advantage; for I shall be enabled to save the farm-yard dung for composts, and I shall have the gratification of seeing my hedges neatly trimmed and my ditches well cleared out. Our stiff soils will be also rendered more friable, and will not suffer as they now do from the retention of wet on the surface.—*Oswald Mosley, Rolleston Hall, near Burton-on-Trent.*

Durability of Oak cut in Winter.—We have a saying in Surrey, that the sap of winter-fallen Oak is as hard as the heart of that which is thrown in the spring. There may be a little exaggeration in this saying, but it serves to show the common impression of the comparative durability.—*A. C. P.*

Raising Seedling Picotees.—Wood's Col. Steel, red Picotee—from three seedlings out of this flower, three red Picotees were produced, one of which was just admissible on a stage. From Hufton's Isabella—I had about thirty plants, many of them were very large and showy, both red and purple Picotees, were well-formed, and made handsome border-flowers; but they were either serrated in a slight degree, or somewhat barred. Lee's Cleopatra—from forty plants of this none were good. From Ely's Criterion, red Picotee, were seven plants, one very capital red Picotee, one single red ditto, one dark self, and four run pink bizarres. From Ely's Grace Darling, purple Picotee, were also seven plants; one excellent, one middling, three with round useless pods, purple Picotees with light edges, two died. Same sort sowed in November produced sixty plants, but none good. From Sharp's Nymph of the Nore, red Picotee, I had two plants; one was a self, the other a red Picotee, with the narrow petals of the parent; otherwise, first-rate. From Hufton's Nehemiah, I raised three plants, viz., two purple Picotees, of which one was tolerable, and one purple self.—*O.*

Cucumbers.—The accumulation of steam in Cucumber-frames about this season is often injurious to the plants. To obviate this I caused a bed to be made of well-prepared horse-dung and Oak-leaves, for a two-light frame, having a partition in the middle, and forming, as it were, two single-light boxes. Each was subjected to the same treatment with regard to fermenting materials; the bed was raised high in order that a good front lining might be applied, the end and back were well thatched with straw to keep out frost, wind, &c. The bed being made, and the boxes placed on it, the seeds were sown in one of them; when these began to vegetate, I found it necessary to supply a lining, and at the same time I introduced a tin pipe, six feet long, and two inches in diameter, placing it longitudinally, but in a sloping direction, in the front of the frame, with the lower end protruding through the lining, near the ground, and the upper entering the bottom of the frame, thus causing a draft of air through the pipe into the frame, the effect of which was not only to raise the thermometer 10° or 12°, but to expel the damp and dry the soil, so that after the plants were potted, I found it necessary, notwithstanding the very cold damp weather, to water daily; and in about three weeks I had a good stock of strong healthy plants. With a view to test the advantages of this treatment, some of the plants were placed in the adjoining frame, which was prepared in the same way as the one they were raised in, with the exception of the air-pipe. Having a good stock of plants, three pots of the best were selected; but although the frame was previously replenished with a lining, and every care taken to preserve them, at the end of a week they perished for want of heat. I then introduced an air-pipe into this frame also, and planted more plants, which flourished through the season with the best results; thus proving to my satisfaction the utility of air-pipes. Much, I imagine, may be effected by this mode of heating, not only in growing Cucumbers, but other plants, where there is a good supply of fermenting materials.—*M. Power.*

Cause of Hardiness.—The difference between hardy and tender plants arises from their capability of taking up chemical substances, alkalies, acids, or earths, by which the juices are kept in a more or less fluid state. In tender plants they become thickened, and are not capable of passing up the vessels at a comparatively mild temperature, and if the temperature is reduced the plant dies, in consequence of the juices becoming congealed. In hardy plants these remain fluid at a very low temperature; if they were to become frozen they would expand and burst the vessels, and death would be the consequence. Plants the most succulent, and apparently very tender, stand severe frost (Scilla Sibirica for instance), while trees, to appearance quite hardy, are destroyed by it. The hardiness of a plant does not depend upon woody fibre, as death in all cases proceeds from the juice expanding and forcing the bark from the wood. Perhaps this notice will lead the Chemist to analyse the juices of hardy and tender plants with a view to determine their different properties, in order to ascertain if it is possible to render plants hardier by giving them substances which will keep their juices fluid, and make them less liable to the effects of frost. In acclimatizing plants, little alteration has taken place in the constitution of any particular species or variety, beyond the capability of its taking up more of the substance, whatever it may be, which renders the juices thinner, and makes them susceptible of the action of frost. Can there be any latent caloric in substances taken up by plants which is afterwards given out to them?—*H. Groom.*

Slugs.—I have a few Cauliflower plants which were much eaten by slugs. I put a small one-light frame over them to protect them from frost—any access from without seemed improbable; nevertheless, when I searched I found a great many slugs; whenever I lifted up some pots of Strawberries within the frame, I always found two or three large ones. I conclude that they have been for some time buried some depth beneath the surface, and perhaps their habit is to lie deeper than is generally supposed.—*J. W., Peterborough.* [Pretty strong gas-water applied to ground infested with slugs at their feeding time kills them effectually.]

Digging Vine Borders.—In many places Vine borders are dug, and an early crop of Cauliflowers taken from them, or they are planted with annuals and greenhouse plants. This is a practice which every gardener should condemn, for it cuts all the roots near the surface, which is a serious injury to the Vine; as the surface-roots are capable of receiving more nutriment from dung laid on the border than those at a greater depth, and in proportion as the surface-roots are destroyed or damaged will the crop be scanty.—*J. W. K.*

Mr. Loudon.—As I find that a passage in the Advertisement on our behalf, which appeared in the *Gardeners' Chronicle* of Jan. 27, has led to an erroneous impression with regard to Messrs. Longman, I shall feel very much obliged by your allowing me to make the following statement. The fact is, that though all the works, which were poor Mr. Loudon's own property, do "stand pledged" in the hands of Messrs. Longman to defray the debt on the Arboretum, &c., those gentlemen hold the books solely as trustees, to receive their proceeds,

* Author of La Flore Parisienne.

† There is a branch of Oak with the Mistletoe around it preserved in the Museum of Paris: if it were not considered a rare production I am at a loss to account for its being so preserved.—M. D.

and to pay the amount in equal shares to the printers, stationers, and wood-engravers, who are the creditors to whom my late husband was so largely indebted. I am most anxious to make this statement, as I have experienced the greatest kindness from Messrs. Longman, who have done everything in their power to alleviate the painful circumstances in which I have been placed.—*J. W. Loudon, Bayswater, Feb. 7, 1844.*

Mrs. Loudon.—It gave me much pleasure to see in the last *Chronicle* that the meeting in behalf of Mrs. Loudon, kindly permitted by the Horticultural Society to take place in their rooms, was finally fixed for Saturday, the 17th inst., when I trust some effectual means will be adopted to relieve Mrs. Loudon and family from the present position their affairs assume, and enable them to reap unfettered the benefits arising from the late Mr. Loudon's works, to which Mrs. Loudon's own talented assistance so justly entitles her. For such a man as Mr. Loudon, after a long life of incessant mental toil for the benefit of mankind, to die so poorly remunerated, is painful to contemplate; especially when we reflect that his embarrassments were occasioned by the immense outlay necessary to produce that valuable and herculean work, the "Arboretum et Fruticetum Britannicum," which must be acknowledged, considering the bodily disadvantages under which for many years Mr. Loudon unfortunately laboured, to be unequalled in the annals of authorship and indefatigable perseverance. To immediately release this distinguished man's family from embarrassment is a debt the horticultural world owe to his memory; his name must ever be associated with the brightest era in Gardening, for to him we are principally indebted for having raised Horticulture from a state of ignorance and empiricism to the rank it now holds amongst other scientific professions. I sincerely hope the purpose for which this meeting is to be held may prove as successful as the most sanguine friends to its laudable object could desire; and I trust that all who take an interest in its furtherance will attend, if possible, and likewise use their personal influence with their friends. It gives me much satisfaction to be enabled to state that a meeting for the same purpose will be held in Edinburgh after the London one, under the kind auspices of Dr. Patrick Neill and other influential gentlemen.—*Joseph Paxton.*

Lemons.—"M.B." forwards a Lemon that was gathered 2d Sept., and the same day put into the box in which it now is (with another which has been taken out); it is now five months since it was closed up. "M. B." preserved two Lemons in the same way for six months, having put them in the 1st of March, 1843, and not opening the box till the 1st of the following September: they were both as perfect as the one sent. [This was a fine specimen, not at all shrivelled, but perfectly plump and sound; and the simple way in which it has been preserved (being buried in rice and earth in a small box), is deserving the notice of those who may have more Lemons ripe at one time than they can use.]

Strepiocarpus Rexii.—This plant has a beautiful appearance in the open border during the summer months. The seed should be sown in the month of April, in pans, in a mixture of peat and loam, then place the pans in a hot-bed, frame, or pit, until the plants are fit for potting off. The seed should be sown very thin, if not, the greater portion of the plants will rot off, for want of air and room to their stalks, as they grow with their foliage prostrate. As soon as the plants are large enough for potting off, fill a quantity of pots with a mixture of leaf-mould, loam, and sand, then place a plant in each pot, and give a little water. Afterwards remove them into the frame or pit; when they have got established in their pots, they may be removed to a cold frame, or greenhouse. In June they may be placed in the open air, and regularly watered during the summer. Towards the end of October remove them to a frame, to protect them from frost. In May or June following they may be planted out where required. As soon as frost is apprehended, take up the plants, with a ball of earth attached to the roots, repot them, and place them in the greenhouse, or frame, till again required.—*J. McI., Hillsborough.*

Societies.

LINNEAN SOCIETY.

Tuesday, Feb. 6, 1844.—Robert Brown, Esq., in the chair. Professor Agassiz, of Neufchatel, and Dr. Schleiden, of Berlin, were proposed as foreign Fellows of the society. Mr. Winterbottom exhibited specimens of Trichomanes speciosum, which he had gathered in company with Mr. Babington, at Brandon, Mountain Dingle, and Waterville, Inverary, in Ireland; also specimens of Spiranthes gemmipara, which he and Mr. Babington had found in considerable numbers at Castletown, Bearhaven, in Ireland. Mr. Anderson exhibited specimens of Brexia latifolia in blossom. A paper was read from Mr. Curtis, on two species of Hymenopterous insects. The first belonged to the family Tenthredinidæ, or Saw-flies, and constituted a new genus, which Mr. Curtis proposed to call Dieloceras. This insect was from the collection of Lord Goderich, and had been taken by Mr. Ellis in the Brazils; hence he called the species D. Ellisii. This insect is chiefly remarkable for its larva forming for themselves a cocoon in community, a fact that has not hitherto been observed amongst insects. The cocoon was exhibited, was oblong, and about the size and form of a Jargonelle Pear. The outside consisted of a tunic, of woolly substance, well adapted to keep off the influence of water as well as to resist the attacks of the Ichneumonidæ. In the inside the cocoon consisted of about 30 cells, having a close resemblance to those of the common wasp and bee, but nothing like so great a regularity in form, but about the same size. The second insect described was a species of wasp, which Mr. Curtis proposed to call Vespa brumex. This insect forms a remarkable nest, which had also been brought from the Brazils by Mr. Ellis. The nest was exhibited, and is about eight inches in length, and 15 inches in circumference. It has a conical form, and is suspended from the branch of a tree by its apex. The texture of the nest is very hard, resembling an earthenware vessel, and very different from that of other wasps. At the base there is a small opening not allowing the passage of more than one insect at a time. The nest had not been opened, and as it was so closely made, it was impossible to ascertain the structure of its interior. Mr. Ross exhibited specimens of optical glasses, with indications of a vegetable growth between them. It was the opinion of Naturalists present that the appearances found on the glass were due to the growth of a fungus belonging to the genus Torula.

IPSWICH CUCUMBER SOCIETY.

The first brace, exhibited by E. Leathes, Esq., an Amateur, commanded universal admiration; but not entering for the sweepstakes, Mr. Latter won the second prize of the Society and a sweepstakes of 4*l.*,—he exhibited eight brace, from 12 to 17 inches long. Mr. Geo. Mills's were the longest, but in other points did not answer to the Society's standard. The exhibitors and their friends afterwards dined together, and spent a most agreeable evening. Mr. Wild, the secretary, stated that he should never be satisfied till he could produce a competition of ALL the Cucumber-growers in England, and would at the next meeting propose "That all winners of First Prizes in England should be allowed to exhibit free of all expense," to a class established for that purpose.

The Judges' description of the PRIZE Specimens exhibited February 8th, 1844.

No.	Names.	Prize.	Sort.	Mode of Growth.	Length.	Form.	Size.	Colour.	Neck.	Spine.	Rib.	Bloom.	Blossom.	General Appearance.

Reviews.

The Year-Book of Facts. 8vo. Bogue.

This is, as usual, a rich storehouse of information concerning the discoveries in science during the past year. In addition to its usual contents, the volume now before us has a portrait of Professor Liebig. We have only room for a few extracts.

"*The Lactoscope.*—M. Donné has introduced 'A new instrument designed to indicate the proportion of cream contained in milk,' to which he has given the name of Lactoscope. The principle of the instrument is based on the inherent property of milk, which derives its opacity from the globules of fatty matter it contains, in being more opaque as the cream is more abundant. The construction is so arranged that the degree of opacity may be examined in layers of various thicknesses. The milk is placed between two parallel plates of glass, the distance between which can be varied at pleasure, and the flame of a taper is employed as a test; a graduated circle indicates the thickness of the layer of milk, and a corresponding table of reference gives the amount of cream. The sensibility of the instrument is such as to indicate dilution with one-twentieth the bulk of water. Upwards of ten years since was invented a cream-gauge, for the same purpose as M. Donné's Lactoscope: it is a graduated glass tube, and has, we believe, been found very useful."

"*Maturity of Grapes.*—M. Payen has read to the Academy of Sciences, at Paris, the report of the commission on a memoir by M. Oscar Leclerc-Thonin, who sought by direct experiment to solve the question—what influence had the leaves of the Vine in relation to the development and maturity of the Grapes? The following results exhibit an explanation of the difficulty of cultivating the Vine in latitudes where temperature may be suitable, but where the atmosphere is frequently foggy. The total suppression of the leaves prevents the development and the maturity of the Grapes. The partial suppression of these organs in the spring provokes the appearance of axillary buds, which replace the leaves taken away; later, when the buds can no longer be produced, this suppression arrests the development of the kernels, diminishes the quantity of the flesh, retards the maturity and injures the elaboration of the saccharine principle. Want of evaporation, and privation of the solar rays, enervate the organs of fructification. Superabundance of water, and consequently defective evaporation, in a luminous atmosphere, incites a luxuriant vegetation of leaves, but checks the elaboration of the juices, which remain acid and unsavoury: maturation is not accomplished. Finally, in a warm atmosphere, moist and dull, the leaves may increase greatly; but the juices are insipid, scarce, and the embryo is not formed.—*Lit. Gaz.*"

"*Zinc Milk Vessels Poisonous.*—The following extract will show the danger and the folly of the practice of keeping milk in zinc bowls—a custom which has lately become very prevalent: these articles being sold with the recommendation of a larger quantity of cream being produced, owing to the galvanic action. 'I would scarcely have believed (says L. Elanes, of Berlin) that zinc vessels would again have come into use for alimentary purposes, as Vanquelin, 40 years ago, proved that such were certain, after a short time, to hold a certain quantity of zinc in solution. I have found by experiment that a solution of sugar which had stood only a few hours in the summer in a zinc vessel, contained a considerable amount of zinc salts. It has often been stated that the cream will separate more easily from milk, if the latter be kept for a short time in a zinc vessel. As, however, it is known that milk will turn acid much sooner than a solution of sugar, it is the more to be apprehended that some zinc will be dissolved, and such zinc will be the more noxious, as it is well known that even a small amount of zinc will cause spasmodic vomiting.'—*Pharm. Jour.*"

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Euonymus Japonicus. Japan Euonymus. (*Hardy Evergreen Shrub.*) Celastraceæ. Tetr.-Pent.-Hexandria Monogynia.—In all respects this corresponds with the account given by Thunberg, of the Iso Curoggi, or black shore-tree, of the Japanese, even to the sporting into a silver blotched variety, also in our gardens. He says it is in Japan a bush about as high as a man. With us it is not as yet higher than three or four feet, but it has all the appearance of becoming much larger. Although no beauty is to be found in its flowers, this plant is of the same kind of value as the common Laurel, Phyllireas, and Alaternus, being a hardy evergreen shrub, with much the appearance of a small-leaved Orange. It is true that in very severe winters it is liable to be killed to the ground, but so are the Bay, the Ilex, and others; it however springs up again and rapidly forms a new bush. When older it will probably become more hardy. It is easily increased from cuttings of the half-ripened wood, placed under a hand-glass or in a close frame, and shaded in summer. It flowers in July and August, but has not as yet produced fruit. There are two varieties, one with silver striped, the other with gold-striped leaves; but the latter is very subject to run back to the green-leaved, while the silver striped hardly ever changes. It is called in many places, "Chinese Box," the name it bore when first introduced from Belgium.—*Botanical Register.*

Lycaste Skinneri. Mr. Skinner's Lycaste. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—This plant is generally called Maxillaria Skinneri, but it is now classed by Dr. Lindley among the species of Lycaste. L. Skinneri is happily designated by Mr. Bateman as the *facile princeps* of all known Maxillarias. "It has at length," says that gentleman, writing in the Miscellany of the "Botanical Register" for 1842, "flowered in the collection of the Rev. John Clowes, with a vigour and beauty that could not be exceeded in its native haunts. The flowers actually measure upwards of six inches across, from the tips of the lateral sepals, while the latter are nearly an inch and a half wide in the broadest part. The colours of the flowers are peculiarly delicate, the sepals being pure white, faintly tinged with crimson at the base; the petals are of a more rosy hue, while the tip is almost covered with spots and streaks of the most brilliant carmine. The column, again, is pure white at the apex, and mottled with crimson spots at the base, while a number of woolly hairs are scattered on its underside. The habit of the plant is stately, and its growth free and vigorous, more nearly resembling Lycaste Deppii, than any other species." To this good description it is unnecessary to add more, than that there appears to be two or three varieties of the plant, differing slightly in the size and colouring of their flowers. The one now described was flowered in the excellent collection of Mrs. Wray, of Oakfield, Cheltenham, and is among the best we have seen. An excellent variety bloomed, moreover, about three months back with F. Cox, Esq., of Stockwell. Mrs. Wray's plant flowered in November last. The species has been brought to this country in great numbers by G. U. Skinner, Esq., after whom Mr. Bateman has named it. Its native place is Guatemala; and Mr. Brewster, the gardener to Mrs. Wray, informs us that Mr. Skinner found it growing on rocky and mossy banks, in very moist places. Mr. Brewster, who has been particularly successful in cultivating it, grows it in an open basket filled with moss and leaf-mould, in a temperature ranging from 50° to 70°. No doubt much of its luxuriance is due to the use of leaf-mould, which is likely to prove a valuable medium for many Orchidaceous plants. It should be kept freely moistened in summer, on account of its vigorous habits; but a cool, dryish atmosphere is indispensable during winter.—*Paxton's Magazine of Botany.*

GARDEN MEMORANDA.

Horticultural Society's Gardens, Chiswick.—Many alterations and improvements have lately taken place here, and others are still in progress. The old smoke-flues in the wooden Vinery have been taken down, and cast-iron tanks put up by Burbidge and Healy in their stead; these are 16 inches wide and 6 deep, with a division along the middle to separate the flow and return. The tanks consist of several boxes, 8 feet long, joined together by hollow screws, and are elevated a little

above the floor of the house by brick supports. The covers are also of thin cast-iron, with small circular openings for evaporation, having lids that can be either shut or opened, as required. The house is about 37 feet long and 12 wide; the boiler, one of Burbidge and Healy's, seems to be a very efficient one; the furnace-doors being made to slide horizontally, can be shut perfectly close, and are not liable to get out of order, as generally happens with those that are hinged. The top of the boiler is a shallow basin, 18 inches in diameter; this is intended to hold water, in order to keep up a moist atmosphere if the boiler be introduced inside; but in this case it was not so situated, and was filled with sand, which being an excellent non-conductor, prevents the heat from escaping. This apparatus has not been yet in use, but it promises to answer admirably; and, running along in the Vinery near the front wall, it occupies little room, and has a neat appearance. The curvilinear Vinery is now also heated by hot water. This has been effected by converting the smoke-flues into hot-water gutters, rendered water-tight by cement, and covered with tiles. The boiler (by Weeks, sen.) which heats this is likewise intended to heat three ranges of pits, each 35 feet long; two of them, for Melons, are already nearly finished, in one of which cement gutters covered with tiles are used, the other is furnished with cast-iron tanks; these are to be cased, both sides and top, with porous earthenware material, made to fit, so as to give out moisture, and prevent the roots from coming in contact with the iron, which would burn and destroy them. The tanks are 8 ins. wide and 5 deep; the flow and return being about 3 ft. apart. These pits being upwards of 12ft. distant from the boiler the pipes between the latter and the troughs are bedded in coal-ashes, about 7 or 8 inches below the surface of the ground. By means of stoppers, each pit separately, or all of them, including the Vinery, may be worked as required. A more efficient means of ventilation has also been afforded for the curvilinear Vinery; this has been effected without disturbing the iron-work or glass, by enlarging the openings at top, so as to communicate with a frame-work covered with zinc, and having vertical shutters in front, turning on pivot-ends so as to open or shut easily up or down, by means of a cord fastened to the upper side of the shutters. The border outside is covered with Croggon's asphalte material, in order to keep the roots of the Vines from being chilled by the snows and cold rains of spring. Having no unsightly appearance, this material is well adapted for Amateurs who grow Vines in greenhouses near or in connection with a sitting-room. The house formerly employed as a Pine-stove has lately undergone great alterations and improvements, and is now an excellent house for Orchidaceæ and other stove-plants. Both back and front walls have been raised five or six courses of bricks higher, in order to admit of a passage being made round the front of the bed. The house is 50 ft. long, and 18 ft. wide, with a bed in the centre for the plants. Hot-water gutters, having a flow and return, covered with tiles, run along the bottom of the bed, the space above them being filled with brick-rubbish, over which a layer of coal-ashes is afterwards placed, on which the pots sit. These gutters keep up a steady heat in the bed of 80°; they are supplied from an iron cistern, in which the flow-pipe terminates at the further end of the house from the boiler. Between the passage and front wall is a slate shelf 2 ft. wide, with an edge 1½ in. deep, for placing plants on. About the middle of the house, against the front wall, is placed a large slate cistern, in which the rain water from the roof is collected. In this, from the pipes passing below it, the water is kept in good condition for watering the plants. Several of these were in bloom. Begonia manicata was here producing a fine panicle of pretty delicate rose-coloured flowers. A small plant of Dendrobium moniliforme was also remarkable for its pretty purple and white blossoms, which contrasted well with the showy Gesnera zebrina that was standing near it. Near this house is a range of pits, forming three sides of a square; these have been recently heated by hot-water gutters by one of Garton and Jarvis's double drum boilers. This boiler answers the purpose of heating very well; but the tanks, being covered with tiles, emit too much moisture during dull weather, in winter, for cuttings and flower-garden plants, with which these pits are filled. The plants in the Orchidaceous house are considerably improved, and have a very healthy appearance; a good specimen of Dendrobium nobile, with several other plants, was coming into bloom. Many specimens are growing on charred blocks, and show, from their fine healthy dark green foliage, that they like their situation, the charcoal no doubt having a beneficial effect upon them. Several Heaths in the next house were growing in soil mixed freely with superphosphate of lime; this has not been long enough applied to thoroughly prove its effects; but the plants appeared to be in perfect health and doing well. This substance, unlike some of the other artificial manures, is perfectly harmless, and may be used with advantage in the cultivation of most plants. In the curvilinear stove a large plant of Lælia superbiens is throwing up a strong flower-stem about 2½ feet long, and will soon be in bloom. Here was also a plant of Xylophylla latifolia, about 6 feet high, completely covered with small pale yellow flowers; this plant had been potted in June, chiefly in charcoal mixed with peat, and a little loam, which, besides having a beneficial effect on its growth, has disposed it to bloom freely. There was also in this house a fine specimen of Euphorbia splendens, fully 5 feet in height and 4 in diameter, producing a multitude of showy blossoms. In front of this stove is a range of pits that were altered some time ago and heated by Garton and Jvaris's horizontal cylinders boiler, which, on account of being set with too small a space for the smoke, chokes up with soot when coals are used either separately or mixed with coke, and does not work well. In the large conservatory, a fine bush of Templetonia glauca, covered with bloom, is very conspicuous, and here Luculia gratissima, which is usually treated as a stove-plant, is very healthy, and flowering profusely in a temperature from 40° to 50°. In the open grounds at this season there is little novelty to notice, except some rock-work constructed with rustic terraces in a corner of the arboretum, near the large iron tent, which is to be planted with hardy Ferns, for which the situation, being immediately behind a south wall, and shaded in summer by trees, is well adapted.

The Naturalist's Corner.

Remedy of the Citron against Poison.—Athenæus relates a remarkable story of the use of Citrons against poison, which he had from a friend of his, who was governor of Egypt. This governor had condemned two malefactors to death by the bite of serpents. As they were led to execution, a person taking compassion on them gave them a Citron to eat. The consequence of this was, that though they were exposed to the bite of the most venomous serpents, they received no injury. The governor being surprised at this extraordinary event, inquired of the soldier who had guarded them, what they had ate or drank that day; and being informed that they had only eaten a Citron, he ordered that the next day one of them should eat a Citron and the other not. He who had not tasted the Citron died presently after he was bitten; the other remained unhurt.

Ulva palustris.—It is not certain, observes Professor Martyn, what plant is the *Ulva* of the ancients. He himself interprets it in Virgil's Georgics as *Sedge*, which is a general name for large weeds that grow in marshes and near the banks of rivers. Most writers, says the Professor, suppose the *Ulva* to be much like the *Alga*, or *Sea-wrack*, and that they differ chiefly in this: that the *Alga* grows in salt water, and the *Ulva* in fresh. But he goes on to mention one thing as certain—namely, that there is no fresh-water plant which resembles the Sea-wrack; and agrees at the same time with what the ancients have said of their *Ulva*. Cæsalpinus supposes, and not without reason, that the *Ulva* is the same with the *Typha*, which we call *Cat's-tail*, or *Reed-mace*. It is a very common weed in this country, and also in Italy, among stagnant waters; it grows to a considerable height, and bears a head at the top of the stalk, which, when ripe, affords a great deal of down. In the Third Georgic it is called a marshy plant, and in the Eighth Eclogue it is described as growing near a rivulet. In the Second Æneid, Sinon mentions his lying hid amongst the *Ulva*, in a muddy lake. The Cat's-tail grows only where there is mud, and is tall enough to conceal any person. In the Sixth Æneid, again, it is represented as growing by a muddy river's side, and the colour is said to be glaucous, or bluish-green, which agrees also with the Cat's-tail. Ovid makes frequent mention of the *Ulva* as a marshy plant. In the fourth book of his Metamorphoses, a pool is described as being remarkably clear, by the negative quality of not having any *Ulva* in it; in the Sixth Book it is called "delightful to the marshes." We find it mentioned also as a water-plant in the Eighth Book, in which Ovid speaks also of a bed being made of the *Ulva*. This agrees with what Matthiolus tells us, that the poorer people in Italy make their beds of the down of the Cat's-tail instead of feathers; and the same Author informs us that there is hardly a standing water in Italy which does not abound with Cat's-tail.

Miscellaneous.

Remarkable Sport of a Currant-tree.—A Red Currant-tree, which had been planted about 10 years, produced this season, at the top of one of the branches, 5 white berries; and lower, on the same branch, was one half red and half white among others entirely red.—*Revue Horticole.*‖

University of Erlangen.—At the recent jubilee of this University, Robert Brown was elected an Honorary Doctor of Medicine; and the Baron Delessert was made a Doctor of Philosophy.—*Bot. Zeit.*

Preservation of Plant Supports.—In 1840, at the suggestion of the Professor of Chemistry at the Museum, I had the points of a number of stakes of Fir wood done over with Seyssel asphalte. These stakes were placed in a soil constantly moist. At the present time (Sept., 1843), they are still as sound as they were at the first hour. The asphalte was laid on very hot with a brush, the wood having been previously heated. It was laid on to the thickness of 1-12th of an inch, by repeated applications. The last coat was smoothed over with a wooden spatula. The bark should be taken off the lower end of the stakes; and the coating should extend three inches above the surface of the soil.—*M. Neumann, in Revue Horticole for Sept.*, 1843.‖

Effects of Frost on the Roots of the Elm.—According to some experiments respecting the sensibility of the roots of trees exposed above ground to the frost during winter, and replanted in spring, it was found that the Elm was most affected. This fact has been again confirmed by new observations made by M. Pépin, who states that although the temperature was only—5° centigrade, or 9° Fah. below freezing, the effect on these trees was very evident. In the winter of 1842-3, he exposed equally the species of Elm; when about to be planted he found their roots all more or less injured by the frost: they were black, and some were entering into a state of decomposition. The roots were carefully dressed in with the knife, even to the quick, but, notwithstanding, three species died, namely, U. campestris, oxoniensis, and rubra; the other species are in a languishing condition, although the spring was very favourable for transplanting trees. What is very remarkable, the roots of the Jujube, Pistachia, Paliurus, Adelia, Gleditschia, and other exotic trees, together with some from the south of France, have not been injured by frost, although equally exposed with the Elms.—*Revue Horticole for Sept.*, 1843.‖

The Royal Agricultural and Horticultural Society of Ghent—has fixed its second quinquennial exhibition for Sunday the 10th March next, at which gold and silver medals will be awarded to the most successful competitors. The highest prize is a medal worth 150 francs, or 6*l*. The award of the Judges will be made on the Saturday. At two o'clock on Sunday will be a banquet at which the Judges, winners, and members of the Society, will participate. The exhibition will commence on Sunday at 11 A.M., and close on Wednesday at 5 P.M.

The Weather.—Notwithstanding the cold weather that has now prevailed for some days, we have a specimen of an Ash-tree, almost in leaf, from Gwrych Castle, the seat of L. H. B. Hesketh, Esq., near Abergele, on the coast of North Wales.

Adulteration of Tea.—On Monday, Mr. Warrington read before the Chemical Society an interesting paper on the Adulteration of Tea, which brought to light some very startling facts. The Author having lately had occasion to examine some samples of Green Tea, discovered that it had been coloured with Prussian blue. This led him to examine a number of samples of genuine Chinese Green Tea, the result of which showed that the Tea in China is frequently thus adulterated: Tea of inferior quality and bad colour being powdered over with Kaolin and Prussian blue, so as to make it resemble the finest Green Tea. Mr. W. has likewise detected, by the aid of the microscope, a number of other leaves mixed with those of the Tea plant, in samples of Tea from China.

A New Berry.—A few evenings since, at a small party in Gardiners' Lane, where, of course, not one of the company had any knowledge of Horticulture, the mention of the Service Berry (or Sorb) gave rise to a discussion as to what sort of berry it was. One person thought it was either the hip or haw; another that it was a species of "Cranberry;" a third that it grew on the Elder tree—nobody appeared to have had any acquaintance with the fruit; till at last an old half-pay officer guessed—and was held to have solved the riddle—that it was a sort of Berry you got in the Service, commonly called a bullet.—*Hood's Magazine.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

As the season advances, give more air to the houses. See that suitable composts are ready under cover for potting and sowing seeds. Some of the hard-wooded plants may now be propagated by cuttings, where a gentle bottom-heat can be kept up. As charcoal is now allowed by all to be of use to plants, endeavour to get a supply of it at hand for mixing with the soil before the potting season arrives. Do not increase the temperature yet, and take care that all the plants are clean, and free from insects.

Conservatory.—The early-forced bulbs will now be out of bloom, and should be removed to some sheltered place, in order to ripen their foliage, where frost is excluded, and other plants may be introduced from the forcing-houses. Hibiscus, Clerodendrons, Justicias, and other half-stove plants which flower in the conservatory, may be pruned, and some of them placed in a higher temperature; but they should not be potted until they begin to grow freely. A few Nerriums and Hydrangeas may be also forced into early growth for this house. A gentle heat would now benefit the Chinese Azaleas for early flowering.

Greenhouse.—Continue to give as much air to this house daily as the state of the weather will admit of, and see that all the plants are watered regularly; the great object is to keep these plants from growing early.

Forcing-pits.—Continue to introduce fresh supplies of plants as the former ones are removed to the conservatory: also other plants from which you wish to obtain an early crop of cuttings, such as Salvia splendens, to come in early in the autumn. Common plants that do not promise much bloom should be at once discarded to make room for others; failures of this nature always occur more or less in early forcing.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department

After the late frost and snow the ground will not be in a working state for some days to come. The directions of last week may be attended to in the shrubberies, and in the flower-garden Roses may be pruned and deciduous climbers regulated and tied or nailed properly. I am not an advocate for close spurring, but prefer cutting out the old wood and replacing it by young shoots every season.

Pits and Frames.—Here, if the number of plants required for bedding out is considerable, there will be plenty of employment for all hands. The whole of the autumn-propagated plants must be potted off without delay, so as to get them well rooted, and turned out into sand in temporary pits by the 1st of April, and so as to set the pots at liberty for a second lot of plants, which should now be coming forward in the propagating frame. It is of no use to plant Verbenas, &c. for beds a foot or two apart, as the experience of the last three summers proves that unless we plant *en masse* at once, the flower-garden will present only empty borders until August or September; therefore, where we wanted one plant in past years we shall in future require four or five; and consequently a corresponding provision must be made. Hydrangeas introduced into the forcing-house in January will now require to have their side-shoots removed, to give strength to the leader. These shoots must be used for propagating, to provide plants for another season. Sweet Peas, if wanted to bloom early, must be sown in pots in heat, for transplanting; indeed, a general assortment of the best annuals must now be sown in pots for the spring and early summer decoration of the flower-garden. —*W. P. A.*

III.—FLORISTS' FLOWERS.

Should frost and snow continue, it will leave the Florist little to do out of doors.

Tulips ought to be out of harm's way.

Pinks, if defended in the manner recommended in a previous Calendar, may bid defiance to hares and rabbits.

Ranunculus-beds will be all the better for frost and snow. The final arrangement of the roots for planting may now be made, keeping all flat-crowned ones for the side-bed.

Auriculas, though necessarily covered, as the trusses are rising in the hearts, ought to have air whenever practicable—withdrawing or tilting the frame-lights in the middle of the day, if only for half an hour.

Carnations may remain *in statu quo*. My own frames have had a current of air passing under them during the whole of the frost

the lights being closed at top to prevent the ingress of snow or rain. The Florist may employ his leisure time in manufacturing and repairing Dahlia shades, making small three-cornered paper bags for sending off Tulips and Ranunculus roots next season, painting or otherwise marking zinc labels, and attaching metallic wire to them for Dahlias, Roses, &c. &c.

Turn compost heaps whenever the tops are frozen.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Look frequently to the state of the soil in those pots situated near the pipes or flues, and apply the waterings only in such quantities as to prevent an injurious state of dryness, and sprinkle the tan whenever it becomes too dry. Endeavour rather to keep the atmosphere of the fruiting-pit constantly in a genial moist state, than to have it very full of steam at one time and dry at another. Choose mild open weather for shifting the succession plants. Pines suffer much from being taken out of the pits in cold or windy weather.

Vinery.—After the Grapes have been set six or eight days, commence thinning the bunches; in the performance of which, use something with a smooth surface to steady the bunch, in preference to handling them. I need hardly say that the outside berries, if equally promising, should be saved. See that the foliage is not crowded, or too close to the glass, and do not let the Vines exhaust their strength in producing long laterals.

Peach House.—In the house started in November, the thinning of the shoots should now be finished. Reserve those side-shoots situated at the base of last year's wood, and tie them in when a few inches in length. If the fruit has set thick upon the trees, thin them, leaving the most promising fruit that are well situated for swelling. The last few days have been unusually favourable for the Peaches; and from the progress they have made, we can afford to use them more gently with regard to fire-heat, should very cold nights ensue. Nothing is more injurious to them than over-heating the pipes or flues.

Fig-house.—The glass being usually kept upon the Fig house during the winter, the soil will be dry for a considerable depth. Previous to watering the border, spread about three inches of decayed turf over it. The turf will keep the water from running to the lowest point, and will invigorate the plants. Let the water be in a tepid state.

Cherry house.—The Cherries that are set should have the blossoms removed by means of the syringe, using a fine rose. Admit air daily, if possible, and keep the atmosphere in a soft genial state. No insects should be allowed to exist here.

Strawberries.—The most forward plants will now demand more attention. Remove all runners as they appear, and sprinkle the plants twice a day in fine weather.

Melons.—When the plants are in the rough leaf, it is time to prepare for turning them out. If the frame culture is to be followed, lay thick turves round the inside against the row of faggots on which the frame rests (see last week's Calendar), pressing it close, so as to prevent rank steam from entering. Lay, also, a layer of turves on the dung and leaves, then raise a mound of half-decayed turfy-loam under the centre of each light, within a foot of the glass. Apply a lining of previously fermented dung to raise a heat of 68° or 70°.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Fruit and Store Room.—Examine all fruit and roots, protect them from frost, and see that seeds are not injured by damp.

Cucumbers.—The materials will now be ready for forming a bed. If the matter consists chiefly of dung, excellent directions will be found in the forcing Calendar of last week, as recommended for the Melon. If the greater part of the material consist of leaves, many faggots will not be necessary; but drain-tiles passing through the bed as recommended for Asparagus, &c., will answer better. In such a case the bed will require to be rather better than 3ft. in depth at this season, and if there is a sufficiency of material to make it long and wide enough to admit a space of 15 ins. round the outside of the frame, and if the sides and ends of the bed are defended by wattled hurdles, a steady heat will be promoted, and linings will not be soon wanted.

Seakale and Rhubarb.—If these were protected as recommended in the beginning of the year, and are now covered with pots or boxes, very little heat will be necessary to bring them forward.

Carrots, Radishes, Asparagus, Potatoes, Sea kale, and Cauliflower, in pits and frames, will have required considerable protection. Where litter is scarce, it should be frequently shaken up in keen frosty weather.

All ground Operations having been suspended for a short time, a good opportunity has been furnished for forwarding in-door work, such as tying mats, preparing stakes, cutting labels, making straw covers, mending nets, cutting shreds, &c. It is miserable policy to keep men out-of-doors in unfavourable weather.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Continue the works, where not finished, as formerly directed, such as felling timber-trees, relieving young plants and trees from the overgrowth of others, clearing out drains and ditches, repairing fences, and planting young trees where there are vacancies.

Coppice.—The directions given last month should be made use of at all convenient times, until the works for the season are completed; and they should be skilfully and properly executed, particularly with respect to the training, and regulating those for poles, rods, &c. likely to be saleable, and keeping all other useless stuff down, so as not to injure them.

Young Plantations.—Bear in mind what has been previously recommended, viz., the importance of training and thinning of young plantations. About the second or third year after a plantation has been planted, begin to train the young trees, as many kinds, such as Oak and Spanish Chesnuts, often get stunted and bushy-headed, and are sometimes years before they make a start to grow. In consequence of this, the less valuable trees get the lead, overtop, and smother them, arising from not cutting some shoots clean out and shortening others, so as to make the tree form a good leader. Some of the very strongest lower-side branches, if pruning has been neglected, should also be taken off.

Hedge Rows.—The directions given last week should be kept in mind and followed up until the work is completed for the season.

Nursery Work.—As the weather is unfit for planting, or sowing seeds of forest-trees, shrubs, &c. for underwood, trenching, digging, and preparing the ground for them should be forwarded when the weather permits. Young trees planted out in rows should be trained, as they often get stunted and bushy-headed, similar to what I have just described in young plantations, and the same process of training recommended there, after the second or third year should also be adopted and followed up here. I much fear the means of accelerating the growth of timber and coppice wood will make little progress until there is an Arboricultural Society established, with plantations for the purpose of experiment in order to show the effects of training, &c.—*W. B.*

State of the Weather near London for the week ending Feb 8, 1844, as observed at the Horticultural Garden, Chiswick.

Feb. 2. Heavy fall of snow, commencing 4 a.m., depth in course of the day 4 inches; frosty at night.
3. Frosty; clear, with bright sun; sharp frost at night.
4. Snow, in broad flakes, commenced falling ½ past 7 a.m.; densely overcast, and thawing rapidly at night.
5. Frosty; clear and fine; sharp frost.
6. Frosty; clear and fine; overcast.
7. Hazy, with slight rain; lightly overcast; heavy rain in the evening.
8. Frosty; exceedingly clear till 4 p.m., then rain and sleet; clear.
Mean temperature of the week 5½° below the average.

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending February 17, 1844.

Feb.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

† The highest temperature during the above period occurred on the 16th, 1831, and 16th and 17th, 1837—thermometer 55°, and the lowest on the 13th, 1830—thermometer 16°.

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3*d.* each copy. It may be ordered of all booksellers. Gentlemen wishing to *distribute copies* among their cottage tenantry, may have them *delivered in any part of London*, by remitting a post office order to this office, at the rate of 25*s.* for every 25 copies.

OUR CORRESPONDENTS will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*O., Vita, W. Billington, R. Errington, J. L. Snow, G. Thompson, J. Wighton, A Practical Man, Peter Mackenzie, Nemo, J. M'I., A Friend to Floriculture, A Bee Preserver, C. A. Lloyd, Philo Sylva, A. F., R. P. N., Herbert, Sussex, R. Dixon*, and *I. W. K.*

BLACKENING GARDEN WALLS.—*D. M. C.*—We retain our opinion. The experiment was fairly tried in the garden of the Horticultural Society, some years since, and the blackened walls still remain there, with the trees upon them. No advantage has been discovered. If you have any *facts* in favour of the practice, and will give us your address, we will, however, publish them with pleasure.

CACTI.—*M. D.*—Possibly your fruit is ripe; if so, it will be soft and tender, although green. Probably, however, it wants more heat. In any case, you must wait till it shows signs of some change of colour before you gather it. When mature, rub it in water till it is freed from the pulp, and sow it thinly on the surface of any soil kept rather dry, and placed in a Cucumber-bed. Young plants will soon appear, and grow rapidly, if kept warm and damp, and fully exposed to light, but not to wet.

CUPPICK.—*A. C. P.*—If you have any considerable quantity of planting to do, you will easily ascertain the lowest price of trees per 1000 by advertising for tenders. The best size for planting is from 1½ to 2 feet high. We will answer your question as to distance next week.

CORRESPONDENTS.—*P.*—Much obliged; but the article does not suit our columns. No man ought to write on landscape-gardening who has not experienced the advantage of an education at least good enough to enable him to write good English. You seem to mistake groundwork for landscape-gardening.

FERNS.—*Arran.*—Remove Ferns now, but not much later.

FIRS.—*Clericus.*—Very small quantities of nitrate of soda will set these plants growing; but it must be applied cautiously. The best way is to water them with it three or four times when they are beginning to grow. One ounce in two or three gallons of water is plenty. Mind, however, that your nitrate is not adulterated with common salt.

GREENHOUSE PLANTS.—*Omega.*—Cut them down at any time when at rest, unless hard-wooded, and then at the time when their buds are just beginning to swell. Dissolve half an ounce of nitrate of soda in a gallon of water. Potter's guano and the super phosphate of lime are both unrivalled as manures.

HEATING.—*H. T.*—Very good tanks may be made of slate, even as large as you want. Others are made of iron, and answer perfectly. You will find persons to supply either by consulting our advertising columns.——*S. M. B.*—No doubt your heat is all absorbed by the material that rests on the tank. If you have not left the sides of the tank uncovered, which you should have done next the outside walls of your house, you must now make chimneys from the surface of the tank, opening into the house. Common chimney-pots will do.——*G. L. H.*—Open brick gutters are not used at the Horticultural Garden.——*M. D.*—You must get an iron pipe that has been cast close at one end. It is to be had at all the places where iron pipes are sold.

INSECTS.—*A Subscriber.*—We recommend you to cut off the infested excrescences, which contain the embryo aphides; to scrape away the earth from the base of the trunks, where, probably, many more are lodged; and before the mild weather arrives to brush and wash the trunks well with either gas-water, lime and water, soot and oil, or train-oil alone: no part of an infested tree must escape, viz., of the trunk or the larger branches. The operation must be performed before the buds burst, and the trees ought to be carefully looked over occasionally in the spring and autumn, when the washing must be repeated if there be the least symptom of a cottony nature. *R.*

IVY.—*G. Et.*—The little stem-roots of the Ivy appear to serve a double purpose, that of holding branches to the body over which they creep, and of feeding them. The latter, however, takes place in only a small degree; most likely because the bodies to which they are attached are incapable of yielding much food. We cannot, however, entertain a doubt that they are true roots in an abortive state. Whether or not they will extend and grow like true roots when placed in the earth, or whether they are paralysed organs, we do not certainly know. But the mischief done by Ivy to the mud walls of cottages and to ruinous brickwork, which is overset by the roots of the branches, renders the former the more probable.

LAWNS.—*W. B.*—These may be either turfed now or sown with grass-seeds in March or beginning of April.‡

NAMES OF PLANTS.—*A Reader.*—Maxillaria punctata.——*W. Gardner.*—Maxillaria Barringtoniæ.——*M.*—Dillwynia ericifolia.——*Amateur.*—We do not know such a plant as the Pine Myrtle, nor do we recognise its seeds. No doubt, however, you may raise it in a hotbed and preserve it afterwards as a greenhouse plant by very ordinary management.

PEARS.—*Non sum qualis Eram.*—Such will also apply to the Winter Bon Chretien Pear. The Glout Morceau is far preferable for your lofty gable facing the south; if your nurseryman has it not, he certainly can procure it.‡

PERENNIAL FLOWER-SEEDS.—*A Reader.*—These may be sown in March, in pots or shallow pans, in a soil composed of peat-loam and sand. They should be covered deep or shallow, according as the seeds are large or small; the larger ones should seldom be deeper than half-an-inch, while those that are small may be only lightly covered. If a slight bottom-heat can be afforded them, it will make them germinate more rapidly.‡

PLANTS.—*C. B—t.*—The following are 24 hardy greenhouse plants, of dwarf habit, that bloom freely, which are suitable for planting in a bed in the house, viz.:—Acacia armata, Chorozema varium, Sollya heterophylla, Templetonia glauca, Pultenea daphnoides, Statice arborea, Pimelea decussata, Oxylobium retusum, Loddigesia oxalidifolia, Epacris grandiflora, E. impressa, Correæa speciosa, Euchilus obcordatum, Hovea Celsi, Chironia frutescens, Diosma rubra, Eutaxia myrtifolia, Eriostemon buxifolium, Dillwynia floribunda, Boronia denticulata, Genista canariensis, Polygala oppositifolia, Coleonema tenuifolia, and Lambertia formosa. ¶

RHODODENDRONS.—*H. Wooler.*—The following are tolerably hardy, and may be grown either out of doors or in a greenhouse; but when grown in the latter, the flowers come much more perfect; they are free-bloomers, and may be easily procured by their names. Russellianum, scarlet; Lowei, pale straw, with brown; tigrinum, pale rose, with dark brown; Nobleanum, dark red; Splendidum (Cunningham's), white; altaclerense, scarlet; multimaculatum, pale rose, spotted; arboreum roseum, bright rose; Victoria, deep red; venustum, pink; augustum, pale flesh, spotted; pulcherrimum, scarlet; grandiflorum (Cunningham's), pale flesh; macranthum, rose; Knightii, scarlet, and Carnarvonianum, bright rose.‡

ROSES.—*C. B——t.*—The following are 24 Tea-scented or other Roses which are suitable for growing in a Greenhouse, being planted out in the beds, viz.:—Emile Courtier, rose large; Barbot, yellow edged with pink; Caroline, blush with pink centre; Comte de Paris, blush; Eliza Sauvage, pale orange; Julie Mansais, white; Adam, bright rose; Bouquet de Flora, carmine; Ceres, rose; Madame Aude, rosy pink; Proserpine, crimson; Hamon, pink and buff; Armosa, light pink; Theresa, pale yellow; Celimene, blush; Queen of Bourbons, buff, Gonbault, pink with buff centre; Augustine Leneur, deep rose; Duchesse de Mecklenberg, straw-coloured, very large; Devoniensis, yellow; Aurore, pale buff; Hardy, bright rose; Belle Helene, blush; and Jaune panaché, pale yellow and rose. The reason why many Roses of the above kinds do not fully expand their flowers, is chiefly owing to want of heat. ¶

STAR JELLY.—*J. J.*—Your question was answered at p. 56 in the Number for 27th Jan.

TIMBER.—*E. H. Lloyd.*—We will make inquiries.

TULIPS.—*Inexperiens.*—The plan you mention for the protection of a Tulip bed is, perhaps, the nearest to our view of the subject, but a temporary protection for winter, is, we think, preferable to any that we have hitherto seen designed to answer the purpose of both, especially for a bed of moderate size. Drive a strong stake, 18 in. or 2 feet long, close to the inner edge of the frame-board (which incloses your bed) at each end, and a similar parallel one in the centre of the bed. Then nail a strong lath, or 1¼ inch deal, upon the three stakes, extending the required length; procure strong wooden hoops, and drive one at each end opposite each stake, nailing each in the centre to the top of the stake, placing a small wedge at the base of each to admit a packing needle between each hoop and the board. Each end of the bed may then be faced outwardly with a portion of garden-mat sown round the edge of the hoop—thus each end will appear a neat fixture for the winter season. According to the distance of the hoops, if wide, slender cord may be run continuously round them to give additional firmness. The remaining mats should then be prepared by sowing two or four together, edge to edge, and thus placed in their intended position over the hoops; when the required number is thus placed, a strong strip of cloth listing should be fitted to the strip of wood along the centre, outwardly, and the mats nailed to the latter. Being fixed to the centre, they are rendered equally secure by (their ends resting upon the broad wooden frame, or otherwise upon the ground) a strong iron rod or wooden wedge resting upon them the entire length. The covering can thus be rolled back to the centre on either side without inconvenience; or the litter, which too often attends a loose covering. Thus far for the winter. For the summer protection, bent iron hoops are perhaps the best, being portable. The boarded sides should be sufficiently strong to admit each hoop to be screwed on by an iron plate at the base. The side and centre rods should be so massy as to give firmness to the whole structure. They might either pass through holes or rest upon hooks; they may also serve for effect as well as for use. The covering, if of strong material, may be tied to the rods. Such a plan, we think, (where means will admit,) is the most economical, because the most lasting.—*W. W.*

VERBENAS.—*Arran.*—If the seed is sown on a hot-bed in March, and planted out in May, they will flower in the autumn.

MISCELLANEOUS.—*Plymouth.*—Your letter having been mislaid, was not answered last week. We would help you with pleasure if we could alter our arrangements, but that is impossible. Where men cannot afford to purchase the *Gardeners' Chronicle*, and wish to do so, it is to be hoped that their masters will procure it for them, especially if, for the sake of its Agriculture, it now passes, as you say, from the house to the farm, and not to the garden. However, these are private arrangements with which we cannot interfere.——*P. H. B.*—As far as we at present know, Whitney's Composition is the best that has been prepared for rendering calico transparent; but we do not know how far its durability can be relied upon, nor are we sure how far it is economical. You can, however, easily get a bottle and try the experiment. We hear a good account of a composition described at p. 139, 1843. You will find Mr. Whitney's agents named in our advertising columns.——*R. E.*—We never heard of the Carolina Gurken Cucumber. The prickly fruit sometimes seen in pickles, is the young of Cucumis prophetarum, but it is not a good thing.——*Villager.* Sand is used in gardening merely as a means of mechanically improving soil; and therefore any well-washed *fine* sand that is not coloured by iron will do. Your question about your cellars is one for a builder. We should suppose that a good bed of concrete, well made, would be the most advisable substance to employ, provided the arches will bear its weight, and in that case earth may be laid on it, and fruit-trees can be planted thereon.——*R. J.*—It is impossible to answer your question. One family of 25 persons will waste or consume twice as much as another, and one garden will be twice as productive as another. The common rule of ¼ acre for four persons exclusive of servants is not enough. Land is of little value in the country, and it is better to have too much than too little. The right way to determine a point of this sort, is to ascertain how many Cucumbers, Peas, Beans, Lettuces, and so on, the family is expected to consume, and then to provide land accordingly. Always grow Potatoes in the field.——*Laddie.*—You are right in having broken up the bottom of your peat-beds, and wrong in having made them 4ft. deep. A foot and-a-half of soil is sufficient for American Plants. If the soil is likely to burn or dry up, give it a good dressing of cowdung.——*Olim.*—Plant Dianthus deltoideus or cæsius. We will try and find a receipt for fumigation against next week.——*Tyro.*—The South Carolina Potato is the tuber of Convolvulus Batatas, and can only be grown in this country in a warm Cucumber frame. It takes up a good deal of room. Plant it without cutting.——*E. T.*—Cut your Hollies down about half way, as soon as you see them begin to swell their buds in the spring.——*A Subscriber.*—We regret to say we know no more about the yeast than we have published.——*M. G.*—No doubt flowers will travel well in tin boxes for a fortnight or so: but we call that space of time "a few days." The answer to which your remarks apply was to a complaint that flowers could not be preserved for many months!——*M. W. C. L. D.*—We are unable to find room for your remarks, which can do no good, for who does not know the importance of employing the poor? Want of money, or want of inclination, are the obstacles, and a panegyric on Lord B., whom we know to deserve all you say, will not remove them.——*Arran.*—Your Amaryllis longifolia wants heat and water when growing. It is half aquatic.——*D. S. W.*—A paper on Gladioli will be published very soon.——*X.*—Get an engagement in some French garden before you start. If you do not you will have to return. But you are better at home; for what can an English gardener learn of the French, except in trifles? English gardeners are as superior to most French as ale to beer.——*A. B.*—The *Newspaper* cannot be sent by post unless the stamp happens to be on that part of it, which is seldom the case.——*J. Starling.*—We do not know.——*P. T.*—We believe near Manchester.——*A. P.*—We never recommend Tradesmen. Chinese Primroses may be had of any respectable Nurseryman.

*** As usual many communications have been received too late for answering this week.

ALTERATION of the TIME of holding MONMOUTH SPRING FAIR.—The inconvenience of holding the Spring Fair on the 18th of April having been felt, in consequence of several other Fairs in the neighbourhood being held about the same time, the subject has been taken into consideration, and a representation made to the Mayor and Town-Council of the Borough, who have decided that, in future, the MONMOUTH SPRING FAIR shall be holden on the Wednesday next after the 15th of February.

Notice is hereby given, that the MONMOUTH SPRING FAIR will this Year and in Future be Holden on the WEDNESDAY Next, after the 15th of FEBRUARY.

By Order of the Town-Council.

Dated this 27th day Jan., 1844.

The Agricultural Gazette.

SATURDAY, FEBRUARY 10, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, Feb. 14 . Agricultural Society of England.
Thursday, Feb. 15 . Agric. Imp. Society of Ireland.
Wednesday, Feb. 21 . Agricultural Society of England.
Thursday, Feb. 22 . Agric. Imp. Society of Ireland.

THE economy of any practice is to be ascertained by a comparison of its cost with the nature and quantity of its result. This is sufficiently obvious. The actual sum of money spent may be large, but it may be *profitably* spent for all that; and if so, though a heavy, it must be considered an economical, outlay.

In estimating the economy of certain branches of farm management one is apt to overlook this, and to condemn an expensive outlay before ascertaining the returns from it. This remark is, at any rate, applicable to the question we often hear discussed at Farmers' Clubs—WHAT IS THE BEST WAY OF KEEPING FARM-HORSES? In attempting to answer this question it is certainly not right to keep one's eye resting only on the cost incurred, that of food—oats, hay, roots—and that of attendance, &c.; we ought, indeed, to look at the sum to which these amount in a given time, but only in order to compare it with the quantity of work which has been accomplished by means of that outlay within that time. If we wish to ascertain whether our plan of keeping farm-horses is economical, we must inquire, not how many bushels of oats are eaten per week, but how much per acre, over the extent ploughed in one week, does the weekly expense amount to. If on any number of farms, of similar soils, which are cultivated alike, the management of the farm-horses be different, then that mode is best the expense of which, whatever it amounts to *per horse*, is least *per acre*. This is the test to which the various ways of keeping farm-horses must be brought.

We propose to consider this important subject at considerable length. It is believed that the expenses connected with it are greater than many farmers think. Indeed, notable differences, which we shall hereafter notice, have occurred among members of certain farmers' clubs, in their estimates of the sum to which they amount per acre. Our present object, however, is to determine the suitableness of the test to which we have referred. When on two farms of similar soils we compare the sums per acre to which the expense of horse-keep on those farms amount, we must remember that it is only in cases where *the cultivation is similar*, that these sums are to be considered as such a test; and not only must the cultivation be similar—not only must the work to be done be the same—but the machines employed in doing it must be similar; for it is evident that two farmers who adopt the same management in their stables, may differ much in their expenses there, if the one uses on his farm cumbrous ploughs and heavy waggons, while the other employs light ploughs and carts; for the former will require more horses to work these implements than the latter.

The importance of good machines on a farm in diminishing various items of expenditure, that of horse-keep among others, will be considered in the course of our articles on Agricultural Mechanics; we only refer to it now, because, before we can admit evidence on our present subject, we must consider to what extent it may be influenced in this way.

The two classes of implements we intend to take up are the cart, waggon, &c., and the plough in its various forms. With regard to the former, the following is extracted from Mr. Pusey's article on Lincolnshire Farming in the English Agricultural Society's Journal.

"*Relative Use of Carts and Waggons.*—The Lincolnshire waggons are very ponderous masses of timber. In the north, light one-horse carts only are used; and here, as the question of carts or waggons is an important one, I will mention an experiment lately made at my request by three Berkshire farmers living near Farringdon. Mr. Edmunds, who has lately introduced one-horse carts, and Mr. Brookes, who employs the light Berkshire waggon, agreed to compare the quantity of Wheat carried by them from two fields of similar crop, along the same kind of road, to their homesteads. The result appears in the following table:—

	Driving lads.	Time. h. m.	Distance in Furlgs.	Horses.	Acres of Wheat cleared.
Mr. Brookes' 3 waggons	2	4 50	5	7	5
Mr. Edmunds' 4 carts	3	5 0	4 2-5ths.	4	9

"The crop carried with waggons was a little thicker upon the land than the other but not so much as to make much difference in the trial. It was necessary, also, to try the one-horse system in the other branch of farm-carriage, the carting of dung. This was done by Mr. Harris, of Hinton. One day he led the dung with his own three-horse carts; the next day he led it to the same field with the one-horse carts of Mr. Edmunds. The strength employed was as follows:—

	Carts.	Driving lads.	Horses.
Three-horse carts	4	3	10
One-horse-carts	5	4	5

"Though the horses on the first day doubled those on the second in number, Mr. Harris carried nearly or quite as much dung on the second day as on the first. These two trials seem decisive in favour of one-horse carts, which are used not in the north alone, but in Bedfordshire and neighbouring districts; and as a cart with a movable harvest-rail may be bought for 13*l.*, I have now no longer any doubt that, unless on very deep land, if a farmer will part with all his waggons and heavy dung-carts, buying a complete set of light one-horse carts in their room, he will be quickly repaid by the large immediate saving in horse-keep."

Here we see that it takes twice the number of horses to perform the same work with waggons as with carts. Obviously, the total expense of horse-keep incurred by a Berkshire farmer who uses waggons, might be much greater than that incurred by a Scotch farmer occupying the same number of acres of a similar soil, who employs carts, without there being necessarily greater economy in the stables of the latter; and the importance thus appears of considering these points before receiving evidence upon the various ways of keeping farm-horses.

But this difference not only exists between carts and waggons,—almost as much appears in the trials which have been made between one-horse and three-horse carts. Thus, an article by the late T. J. L. Baker, Esq., in the 1st vol. of the English Agricultural Society's Journal contains the following passage:

"Two heaps of stone, of 32 tons each, were landed from a barge; they were to be taken to the same place, about a mile and a quarter off. A farmer began the first with two large carts and three horses, one cart was being loaded while the other was moving, and the horses were taken off and put on at every load. Finding that he could not do it in the day, he gave over at the end of about six hours, and set to again the next morning. * * * Their work was completed at 11 loads (which of course is nearly three tons to each load, or one ton to each horse), in nine hours and fifty minutes. I began the other heap with three small one-horse carts, and completed it in one day at 21 loads (being nearly a ton and a half to each horse), in six hours and one minute; which was a saving of about three hours and a quarter on nine hours and fifty minutes, or rather more than one third. In this I had three decided advantages—first, the saving of time by trotting back; secondly, the rest that each of my horses got in his turn while his cart was being loaded; and thirdly, the ease with which my carts were loaded in consequence of being lower."

From this account we may infer that a great saving in horse-keep was effected by Mr. Baker by the use of one-horse carts, because fewer horses were required to do the same work in the same time than were needed by the neighbouring farmer with his three-horse carts. It should be stated, that there was some difference here in the breed of horses employed, but that could not account for all the difference in the work performed by them.

Guided by these two cases, we shall be prepared, at a future opportunity, to look somewhat narrowly into the evidence on the subject of *true economy in horse-keep*. Before doing this, however, we have to consider in a similar way the bearing upon this subject, of the variety which exists in the form of the plough. This we hope to take up in our next *Gazette*.

ON THE AGRICULTURAL VALUE OF LAND.

(Continued from page 74.)

3. The way in which the nature of the crops cultivated, and the mode in which they are made to succeed one another, influences the fertility of the soil, is a point which has been much discussed; that it does possess this influence is very evident, from the wretchedly poor state in which some farms are to be seen on which no attention is paid to it, Corn crops being taken off the same land during many successive years; and from the good state of cultivation, on the other hand, to be seen on farms, where a proper rotation of crops is adopted. It is, indeed, an acknowledged fact, that a crop of any kind will exhaust the land it is raised on, and, that if taken off the same land for many successive years, it will, at length, tire it out altogether. Some, however, possess this property in a greater degree than others. Seed-bearing crops, for instance, exhaust the land more than green crops, and a fact arises from this, which seems to have been forgotten by some farmers, namely, that if weeds be allowed to seed, the farmer suffers, not only by their increase in the following years, for "one year's seeding gives seven years' weeding," but also by the exhaustion of his land which they occasion.

It is also an acknowledged fact, that while, generally speaking, Corn crops thrive after green crops, each Corn crop has its particular green crop, after which it thrives best: thus, Barley succeeds Turnips, Oats succeed Grass, and Wheat, Potatoes or Beans; and 1, Wheat; 2, Turnips; 3, Barley; 4, Seeds; 5, Oats; 6, Potatoes, constitute a very good six years' rotation. De Candolle's excrementory theory was framed to account for this curious preference, which certain crops have for the land off which certain other crops had just been raised. It is supposed that plants exuded at their roots those portions of the descending sap which were not fitted for their own growth, and that, while this excrementitious matter was poison to *them*, it was nourishing food for another class of plants: hence the propriety of making the one kind of plant succeed the other. Another theory supposes that each class of plants, taking from the soil one particular substance necessary for its growth, will die after having at the end of a course of years thoroughly exhausted the soil of that substance; but that for the growth of another class of plants which does not require that substance, the soil is as well adapted as ever. Neither of these theories explain the fact which often occurs, that land, after a course of cross-cropping with only one kind of plant, as the Teazel or Wheat, often becomes so worn out, that it will not yield a good crop of any other plant whatever. This, and many other objections, depending chiefly on the minuteness of the experiments brought forward in proof of either theory, have been urged by practical men against them; and it has been stated that the advantage of a rotation of crops is owing more to differences in the nature and in the cultivation of the crops which succeed each other than to any alleged habit of plants generally,—the account of which depends for its truth on the accuracy of a series of the most delicate experiments. Thus, during the growth of the Wheat crop, the land receives one kind of cultivation, and favours the growth of one kind of weeds; during that of the Turnip crop, the land receives another kind of cultivation, and thus another class of weeds will spring up, if any are allowed to appear. The propriety, then, of alternating these crops is evident. Whether, however, the explanation of the necessity of a rotation of crop be successful or not, that such a necessity exists is established; and the farmer, with reason, acts upon the fact at once, and does not wait till a sufficient reason be given for it.

It has been seen, then, that the fertility of land depends on its mineral composition and on its cultivation. It has been seen that, under the first, the soil may be improved by drainage and by the admixture of mineral substances, any alteration of this kind which it undergoes being permanent; that under the second it may be improved by a proper attention to the management and application of manures—to the looseness and depth of the soil—to the adoption of a suitable rotation of crops; and that any alteration produced by these means is not permanent, but that any departure from the established rules of good cultivation is followed by an immediate decrease of the fertility of the land.

From what has been said it will appear that a knowledge of many of the sciences may be made available by the Agriculturist in the improvement of his land. Chemistry will point out to him where its fault lies, and Geology will often show him where to look for its remedy. Both, if he make use of them, will assist in improving his practice; and in all his experiments, by explaining to him the success of this or the failure of that, will render his business a source of much pleasure as well as profit. Experience, indeed, may, in the end, lead to the same results, and teach the same lessons as a knowledge of these sciences; but the lessons of the one are but imperfectly learned at the end of a long series of years, during which they have to contend with prejudice and custom, and everything tending to subvert or distort the truth; while those taught by the others are learned, and may be made use of at once.—*M. S.*

ON THE WEEDS INFESTING FLAX FIELDS.

As it seems probable that the culture of Flax will be considerably extended in this country within the next few years, it is desirable that attention should be drawn to the prevalence of certain weeds in that crop. Several weeds of a large size are constantly found amongst Flax, which, as they flower sooner than the time for pulling the Flax, may easily be removed by the hand; and as their seeds are introduced into the soil, intermixed with the seeds of the crop, it is of much consequence that the plant should be removed from such crops of Flax as are intended to afford seed for future cultivation.

There is, however, a weed of a far more destructive character, which it is much less easy to destroy, since it can scarcely be removed by hand without very great injury to the crop; and as, at the same time, it is of a very destructive character, it has long appeared to me to be deserving of considerable attention. Accordingly, I have endeavoured, in different ways, to call the attention of Flax cultivators to it.

The weed to which I refer is the Flax Dodder, which I have seen destroying very considerable portions of the Flax crop in England, Scotland, and Ireland. It is a plant which germinates in the ground, and sends up a slender threadlike stem, which, twisting itself about, soon touches one of the stems of the Flax amongst which it is growing. As soon as this takes place, the Dodder twists itself round the Flax, and throws out from the side next to its victim several small processes which penetrate the outer coat or cuticle of the Flax, and act as suckers, by which the parasitical Dodder appropriates to its own use the sap which has been prepared in the Flax, upon which the growth of the Flax depends. The Dodder then separates itself from the ground, and relies solely upon the Flax for its nourishment, producing long slender leafless stems, which attach themselves to each stem of Flax that comes in their way. Thus large masses of the crop are matted together, and so much weakened as to become almost useless. This plant

produces great quantities of seed which is usually threshed with the Flax-seed, and sown again with it in the succeeding year.

Several years since I took considerable trouble to ascertain if all foreign Flax-seed was mixed with that of the Dodder, and was led to the conclusion that the American Flax-seed is nearly free from this pest, and that that from Russia, and especially Odessa, is peculiarly infested with it. As this is a subject of much importance, I trust that the cultivators of Flax will turn their attention to it.—*Charles C. Babington, St. John's College, Cambridge.*

ON MINERAL & INORGANIC MANURES.—No. VI.

By Professor Charles Sprengel.

(*Translated from the German.*)

The duration of the action of lime manure depends, first, on the quantity used, and on several other circumstances, to be alluded to. If the amount of lime is calculated of which the soil is deprived by one harvest, it will be found that 500 lbs. per acre should be sufficient for many years; still the plants cannot absorb all the lime which has been brought on a field, because they do not penetrate with their roots every particle of earth; and a great part of the lime is also nearly lost to the plants by its combining with the hydrated silica contained in the soil, forming a compound insoluble in water. Another portion is dissolved by the rain and snow-water, so much, viz., as has combined with humic and carbonic acids into salts, which are soluble in water. The silicated lime, it is true, is again in its turn decomposed by the carbonic and humic acids of the soil, whereby humate and carbonate of lime will be formed; but this always takes place so slowly, that the plants cannot derive much benefit from it. These processes, therefore, fully explain why the manuring with lime needs to be repeated, and why its effect, although (by using large quantities) it may last 25 or 30 years, will not last with small ones more than 6 or 7 years. It is, moreover, to be considered that the salts, which are produced in the soil by manuring with lime, are generally difficultly soluble in water, and consequently that the soil must contain a considerable quantity of them, if they are to improve the growth of plants or aid their nourishment.

The ways in which lime is used as manure are different. Generally, small heaps are formed of it on a field previously ploughed; these heaps are covered very closely with a layer of earth, two or three inches thick, and the lime has to remain in that state until it has become slaked. These heaps are afterwards well worked up with the soil above and beneath; the lime is carefully spread, then harrowed and ploughed under about two inches deep; the land is then harrowed; then another ploughing, somewhat deeper than the first, is performed; and the whole operation is concluded by harrowing. Although this process is very simple, and requires little manual labour, it is not to be doubted that it is still imperfect. In the first place, as the heap soon becomes cracked by the swelling of the lime, it will not be protected by the earth from the influence of the atmospheric air, which will cause it to lose its caustic property; and consequently, when subsequently mixed with the soil, it will not act so powerfully on the organic matter and the coal of humus contained in it.

Another way of using lime is to throw it, at some short distance from the fields, into one or more large heaps, and to pour so much water upon it as entirely to slake it, and convert it at once into a powder. Three pounds of burnt lime will require for that purpose one pound of water; *i. e.*, the two combine chemically in that proportion, and become converted into a dry, very fine powder. On the other hand, not too much water is to be taken, else a pap will be produced, which cannot be spread about, and which when dry will form a hard mortar. If some lumps of lime should not have been slaked, they are to be thrown aside, when the limedust is conveyed on the fields, and these again sprinkled over with water, and if they should not then fall to pieces, they are either not pure lime, or have not been sufficiently burnt, which can be easily ascertained by trying them with a little acid. The main object, after the lime has become slaked, is to spread it as soon as possible over the field, and to proceed with it as stated before; because everything depends on the lime coming in as caustic a state as possible on the ground, in order to accomplish what we expect.

The third method of manuring with lime is the following:—It is placed in conical heaps in alternate layers with vegetable mould, taking three or four parts of earth to one of lime, over which the necessary quantity of water is afterwards poured; the heap is then well covered either with turf or straw, over which some earth is to be thrown, and the whole left quiet for three or four weeks. Afterwards, the lime, which by this time has been converted into powder, and the vegetable mould are well worked up, and then carried on the field. There is no doubt that this method, provided earth be at hand, is to be preferred to any other, as all lime which has not combined with humic acid will remain caustic, and will act in the heap very powerfully on the coal of humus. The greatest amount of labour it occasions is fully repaid by the produce obtained, as a considerable quantity of humate of lime is produced, which, as we shall see hereafter, is a superior manure. Vegetable mould, however, is not to be had everywhere.

In some countries the slaked lime-powder is strewed over the clover-stubble, it is then shallow ploughed, and before Rye or Wheat is sown, the field is harrowed and ploughed several times. But it is not advisable, on any account, to strew the lime-powder over growing crops, because as it is soluble in water it easily corrodes the plants. It may, however, be used in that way on meadows on which much moss is growing, as it destroys those plants, and after it has united with the humic acid of the soil it will elicit Clover and sweet grasses.

It is also a general rule, never to manure with lime in wet weather, for it will then combine with the sand of the soil into mortar. If, however, the lime is once well mixed up with the soil, rainy weather is desirable, as it then soon becomes dissolved and thoroughly well mixed with the whole of the furrow-slice, and then acts strongly on humus, the organic matter, worms, &c. Lime is burnt in kilns variously constructed; wood, peat, brown or common coal being used as fuel. The chief point in the operation is not to expose it too soon to a great heat, and to supply the fuel uniformly. To let it cool before it is thoroughly burnt is always very injurious. If wood is used, the ashes obtained will yield a manure superior to the lime itself.

(*To be continued.*)

ON THE DESIRABLENESS OF EXPERIMENTAL FARMS.

It may reasonably be asked, what is the practical benefit likely to arise from the publication of experiments of which the results are not only various, but often contradictory, and which are, therefore, more likely to render the farmer sceptical as to any good that is to be derived from the use of the new manures, than to aid him in the choice of that best suited to his own case, or to teach him to calculate upon the result from any fixed principle by which he may judge of its applicability to his peculiar soil and situation. Professor Johnston, of the Durham University, remarks, in his clever and interesting lectures on Agricultural Chemistry, after giving a detail of many experiments with Nitrates, p. 491: "We are obviously in want of better and more numerous observations, especially in regard to Turnips. The above discordances will either vanish when we obtain a larger collection of results, or they will find an explanation in the more accurate observations we may expect to obtain in regard to the climate, soil, and geological portion of the locality in which the experiments are made." He then goes on to urge upon those practical men who are really desirous of promoting the vastly important work of Agricultural improvement, to be more minute, exact, and accurate, in the details of their experiments in these respects. These, doubtless, are objects of most desirable attainment, and I fully concur with Mr. Johnston in his wish and opinion on the subject; and I gladly avail myself of this opportunity to express my gratitude to him for the benefit he has conferred on Agriculture, by proving, like other philosophical men who are engaged in the same good work, its connection with, and dependence upon, those principles of science, without which its practice can never be subjected to fixed laws, or be secured against doubtful and unsatisfactory consequences. But if he entertains the hope that such information as he desires, involving the necessity in the party giving it, of scientific knowledge, acute observation, and philosophic research, is to be obtained from the practical farmer, I think I can safely forewarn him of his disappointment. The farmer, as such, is the least likely of all men to pursue such experiments to an impartial and accurate conclusion. His practice is founded upon the custom of his vicinity and his own observation and experience, but he is generally ignorant of the efficacy of chemical agents and too often prejudiced against any innovation of ancient habits—and were his knowledge and acquirements equal to the task, the time and attention necessary to conduct with due vigilance and accuracy such details and experiments are not at the command of the industrious, persevering, rent-paying farmer. He must secure his crop of Hay when the sun shines, instead of occupying himself with the minute investigation and comparative weight of one plot that had been manured with this, and another with that ingredient. He must attend a distant market at the time when, from the state of the weather or some other cause, some other experiment would have been most accurately tested, and the opportunity being lost, probably renders all the care previously bestowed upon it of no avail. Many other reasons might be adduced to prove that it would be visionary to expect such results from the mere farmer, and if by accident one should be found with taste, habits, and inclination for such pursuits, it might not be venturing a very rash conjecture to suggest that he would not be the first to attend the summons on the rent-day. But then there are other practical Agriculturists besides the rent-paying farmers. Where are the patriotic and science-loving owners of many broad acres—the amateur Cincinnati of our Agricultural day, who so zealously and so laudably bestow their time, attention, and means, in aiding the advancement of the most important national work of Agricultural improvement? That there are many such I gladly admit, and their exertions entitle them to the nation's esteem and gratitude—but it is not the business or the duty of any individual to subject himself to the labour and incur the responsibility of making experiments for the Agricultural world, through all the range of Agricultural science. He may so employ himself for his own information or amusement, and he may give the results the chance of publicity, but still there might be wanting that minute and rigorous investigation of all the qualities peculiar to the soil and situation, and that small yet influential variation in either, which may cause a certain kind of manure to be more or less applicable, or not at all so, to the object in view. This can only be discovered by a close chemical analysis of the soil as well as the manure, by which to ascertain, in what property necessary to its fertility the one is deficient, and which the other is calculated to supply. The farmer knows by experience that he cannot grow the same kind of crop in succession on the same land without a great falling off in produce, and that even with good management, his land will in time become unproductive of certain crops when repeated at too short intervals—but it is for the chemical investigator to explain, of what peculiar property such crops have exhausted it, and what particular kind of manure is best calculated for its restoration, as well as to determine what preference certain classes of plants have for one kind of manure over others. An extensive course of experiments, well conducted under the direction of capable and scientific men, and their results published in a systematic manner, would afford to the farmer a dictionary of Agriculture by which he would know what effects to expect from the application of certain kinds of manure to certain descriptions of soil and crops, without working in the dark and trying for himself hap-hazard experiments too often ending in disappointment. But the question will be asked, how is this most desirable object to be attained? I confess that it seems to me to be quite within the reach of those zealous and influential gentlemen who have already effected so much in the establishment of an institution as yet so young, but still so wealthy and prosperous as the Royal English Agricultural Society. The undertaking would doubtless be attended with trouble and labour to those who should engage in it, and what public and useful work is exempt from them? but I cannot anticipate any insuperable difficulties, nor conceive of any object more worthy their attention and the appropriation of a part of their ample funds and resources than the establishment of one farm at least for the purpose of conducting experiments in Agriculture upon scientific principles, and on an extensive scale; such experiments to be conducted, as a matter of necessity, by some one or more persons thoroughly conversant with Chemistry, Geology, Botany, and the other branches of science bearing upon that object, and solely responsible, under the direction of a committee of management, for the truth and accuracy of their details and results. To enter into any particulars of the arrangements of such an institution would be premature at the present time. Certain examples of the kind do exist on the Continent of Europe, but they are in many respects defective, and capable of much improvement. The subject has been ably treated in an excellent article in the Journal of the English Agricultural Society, by Professor Daubeny, which it may be hoped will attract the attention it merits. If, in addition to an experimental farm founded by the English Agricultural Society, the National Societies of Scotland and Ireland would also follow its example, and if a regular interchange of communication were maintained between the scientific men at the head of each establishment, under some previously-arranged plan for conducting similar experiments; the variety of climate which the several institutions would necessarily embrace, and the variety of soil which natural circumstances, aided by a little care in the selection, must also afford, would give them ample means of detecting the latent influences which the variations of soil and climate are found to exercise on the vegetable and animal worlds. A summary and digest of their combined transactions, judiciously prepared for publication, would present to the public such a compendium of Agricultural knowledge, based upon scientific principles and reduced to practice, as it has never yet possessed, nor is ever likely to possess, but through some combination of elements equally extensive and equally powerful for good, as that which I have enumerated, and would add more to our information on this all important subject in the ensuing ten years than is likely to be done by a century of unassisted and casual observation.—*Extracted, by permission, from a published "Account of Experiments, &c.," by John Grey, Esq., Dilston.*

ON GORSE, AS A WINTER FOOD FOR HORSES.

Continued from page 75.

Though almost every farmer in that part of Wales with which I am acquainted feeds his horses with Gorse if it grows naturally on any part of his land, a very small portion of them take the trouble of cultivating it for that purpose, except upon the tops of their fence banks, for which use a considerable quantity of seed is imported from Ireland, the price fluctuating from 6d. to 1s. per lb. If any person cultivates it for sale, they prefer purchasing the crop of him at the rate of 20*l.* an acre, to the necessary outlay of capital, in raising a perennial supply of fodder, which occupies the soil for two or three years before it comes to its full value. At my suggestion, the manager of the Nantlle Railway sowed it upon the embankments of that work, with the double object of preventing slips and producing some return. The annual sale after the third year produced 100*l.*, and the rate per acre, at which the better portions of the crop sold was what I have stated above. The purchasers were the small farmers, employed in carrying copper and slate from the mines and quarries in the vicinity. While staying in Norfolk, during a very dry summer, in which the Hay crops were greatly deficient, I proposed to a farmer, who was anticipating a want of fodder for his horses during the ensuing winter, to use for this purpose the Gorse which was growing in sufficient abundance on the fences of his farm and on the waste ground of the lanes surrounding it. I succeeded in convincing him of the value of it, but the prejudices of his men prevented his adopting the suggestion, and he preferred purchasing Hay at a high price. When land already under arable culture is intended to be laid down with Gorse, a crop of Oats may be taken with it, but they should be sown thin, or they will injure the young plants. The usual allowance of Gorse seed is from 12 to 15 lbs. per acre. If intended to be sown upon rough land under pasture, the sod should be pared and burned, and a crop of Oats may be taken the first year, under the precautions I have mentioned. Should the land with this treatment be such that a heavy

crop of Oats may be expected, it will be better to defer the sowing of the Gorse for a year, and to take a second crop of Oats with it. The Gorse may either be sown broadcast or in drills; if the latter plan be adopted, the drills should be about a foot asunder. In the spring of the second year, a dressing of peat-ashes is found very beneficial; and it will be necessary to free the plant from coarse Grass and weeds, which would smother it during the summer. The same process will be occasionally advisable in after years, and, therefore, drills are to be preferred. It should also be defended from the bite of sheep and the trampling of cattle. It will hardly be worth cutting the following winter, but in the year after that, it will be nearly in full perfection, and will afford a supply from October to the end of April. The parts of the plant used are the succulent shoots of the preceding summer. It is not the general practice to cut it every year, but only every alternate year. In this case some of the woody portions of the plant are unavoidably mixed with the green shoots, and require to be separated from them. On the Nantlle Railway the Gorse was cut every year, for five or six years in succession, without any apparent diminution of produce, till towards the close of that period. When the crop begins to exhibit such indications, a year's rest will probably set it to rights again.

In Wales, the Gorse was formerly prepared for the horses either by pounding it by hand with a wooden mallet, or by means of a number of wooden stamps, set in motion by a water-wheel. Cast-iron gorse machines are now very generally substituted for these. They consist of a wooden trough, like that of a chaff-cutter, in which the shoots of the Gorse are laid, mixed with a little hay and straw, and the mixture is brought forward by means of two fluted cast-iron rollers, to meet an iron cylinder armed with knives, spirally disposed around it. Notwithstanding the spines of the Gorse, which are not destroyed by the process, horses delight in the food, and thrive upon it. They ought not to have much Corn with it, as it is rather heating in its nature. A riding mare belonging to Mr. S. Holland, of Plas Penrhyn, though in constant work, was always ready to throw up her heels and run away with him, her food consisting, during the winter, of only a bushel of Oats per week and as much Gorse as she would eat, having about a third of its weight of hay cut with it.

The cost of such a machine used to be about five pounds. It may be worked either by hand, or by a small water-wheel where there is a rill of water at command. For cows, it is necessary that the Gorse should be pounded to a pulp, to get rid of the spines, and a good machine for effecting this is a desideratum. Should any reader of this Journal, having a quantity of Gorse growing on the wastes around him, be disposed to try it as a winter food for his horses, and should he wish to purchase such a machine, I am sure that if he puts himself in communication either with Mr. William Turner, merchant, Caernarvon, Mr. Owen Jones, land-agent, of the same town, or Messrs. S. Holland, jun., and Co., slate quarry proprietors, Portmadoc, any of those gentlemen will have pleasure in procuring it and forwarding it by some of the numerous slate vessels which sail from the ports of that district to all parts of Great Britain and Ireland.

Were I wishing to introduce the use of Gorse as a food for horses belonging to me, knowing the prejudices of the men against any new kind of fodder, I should in the first instance confine the use of it to my own riding horse, satisfied that from seeing its effects, and the avidity with which it was eaten, they would soon, of their own accord, request a supply for the cattle under their care.—*J. Trimmer.*

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. V.

PART II.—*On the Chemical Constitution of Plants—as compared with that of the Soil—and the Necessity of adapting the Cultivation of the One to the known Composition of the Other.*

ALL living beings, animal or vegetable, have their life supported, their waste restored, and their maturity perfected by means of food, which possesses a chemical composition similar to their own.

In animals this food is obtained and digested by a peculiar series of organs, with which they are, according to their several habits, specially provided. They are termed organs of prehension (laying hold of food), mastication, deglutition, and digestion. Plants are the organizers or manufacturers of food for animals, and in them a simpler, but not less beautiful, system is provided. The Physiologist sees with exquisite pleasure, in the roots of plants, with their delicate spongioles or terminal suckers, which instinctively appropriate that part of the soil which is their natural food, and in the leaves with their respiratory system of cells, the rudimentary type of that higher organic system which in the animal creation obtains the most perfect development.

But the simplest, as well as the highest and most complex organization is equally destined to perform distinct and appropriate functions in the scale of living beings. If a plant and an animal that feeds upon it are taken into the laboratory of the chemist, their ultimate constituents will be found identical. And yet what a difference to the casual observer exists between the two! and how much greater still, appears the difference in their food! Yet, in reality, they are chemically the same.

The terms unorganized and organized matter explain the real difference in the food of each. The plant lives upon the elements of organic matter, and thus becomes an organic being. The animal lives upon the plant which its superior digestive and assimilative system converts into the muscle and bone, and the skin, hairs, or feathers with which its body is covered.

But the ultimate analysis of bone and muscle, and plants, is identical. The plant deposits in the cells of its inimitable structure certain mineral substances. The animal converts the lime or iron thus stored up into bone, or the colouring matter of blood! and thus plants become not only the organizers of animal food, but the depositories of principles essential to the perfect development of the animal.

Now, from these observations the reflecting observer will be convinced of the truth of the following propositions:—

1.—That a knowledge of the chemical composition of plants will enable us at once to select for them appropriate food; and

2.—That knowing the nature of the soil, and understanding the chemical composition of the plants he wishes to grow, the scientific farmer can, by increasing the quantity of appropriate food, increase to a certainty the weight or measure of his crop.

Theoretically, a grain of Wheat or Barley, a Mangold Wurtzel, a Turnip, or a Potato, can be increased in bulk as easily as an ox can be fattened in its stall. But the food appropriate for the tuber may not be, and indeed is not, that which is proper for the grain. The former contains more starch than albumen; the latter more albumen than starch. Is it not obvious then that the manure must be selected in accordance with the known composition of the crop, and still more in accordance with the known condition of the soil. I am the more anxious to dwell upon this point, because mistakes are daily committed, and Agricultural chemistry is brought into disrepute by the consequent failure of the experiment, which is made without regard to the very first principles that science professes to teach.

Plants, then, are the organizers of food for animals. To support animal life two kinds of food are indispensable—

1.—That which contains azote or nitrogen, and hence is called azotized food.

2.—That which does not contain azote, and is called non-azotized food.

The tissues of all plants, the stalks, leaves, roots, &c., are composed of non-azotized matter; they, therefore, must be fed with manure of a similar nature. But all plants upon which animals feed contain azotized matter, which is deposited in the cellular structure of the plant, more particularly of the seed, as in Wheat, Barley, Oats, Beans, Peas, &c. Now this azotized matter does not exist as a constituent of the soil; it must be added to it by the farmer. Thus, when a farmer spreads his field with the manure formed by his cattle in the straw-yard he supplies non-azotized food (the straw), for the production of the tissues of the plant—and azotized food (the urine); which after decomposing, the plant will organize and deposit in the cells of its structure—in the form of gluten, vegetable albumen, fibrine, legumen, &c., &c. The dung is principally useful in supplying the plant with phosphates, of which we shall speak hereafter.

In addition to the organic matter taken up by the roots in the form of non-azotized and azotized materials, there are certain inorganic substances also taken up, either to perfect the fabric of the plant, or with the ulterior design of being appropriated by the animal which feeds upon it. These inorganic matters are also deposited in the cellular structure of the plant.—*C. B. Bree, Stowmarket.*

(To be continued.)

Home Correspondence.

Effects of Drainage.—Observing in a late Number of your journal an account of the improvements in draining upon the estates of Lord Stair, I beg to state an instance of a farmer of my acquaintance, who has far exceeded the cases adduced on that nobleman's estates. Mr. Robert Ferguson, of Muirhouselaw, tenant to John Ord, Esq., a few years since entered upon a lease of 21 years for the above farm, a cold wet soil, which, though of considerable extent, seldom produced more than 20 to 25 diminutive stacks of corn, and other produce in proportion. During the first three years of the lease, Mr. Ferguson opened and laid in 120 miles of drains, all filled with stones taken from a quarry and broken small; a more expensive process than tile-draining, but at the same time greatly superior as regards efficiency. The expense of opening the drains was borne by the proprietor; and the expense of quarrying the stones, breaking, and filling the drains, was borne by the spirited tenant; and what has been the result,—the stackyard, instead of being only in part filled with a scanty produce, as formerly, is now quite insufficient to contain the crop, as Mr. F. is now able, on an average, to set up from 75 to 80 large handsome stacks of corn; hay, turnips, and other produce being in proportion. Let landlords give leases and encouragement to their tenants, that the soil may be put in a condition to bring forth abundant crops. We hear daily from those who are indisposed to lose sight of a shilling of their capital, that farming is an unprofitable occupation: I say to them, look at the example set them by the case now mentioned—and go and do likewise.—*W. D.*

Remarkable Case of a Cow that was swollen with Eating a Quantity of Swedish Turnip-tops.—The owner of the cow was alarmed by finding her swelled to an immense size, but waited till the beast was falling down before he applied any remedy; he then tapped her in the left loin, about two inches from the last rib, making an opening of about three inches, from which, by introducing his finger and thumb, he drew out about three quarters of a cwt. of undigested leaves, which, with the discharge of wind, rushing out as it did with great violence, was evidently a great and immediate relief to the animal. In two hours after, a plaster of pitch was placed over the wound, a dose of salts and, what is here called, Irish slate, was given daily with her own milk for a few days, and the cow is now, two months after the circumstance, as well as ever.—*E. C.*

Coprolites.—Professor Henslow, in his communication on Coprolites, in your last Number, expresses his surprise that I should, in my letter to you on the same subject, have supposed there might be some difficulty in distinguishing, by the external appearance, the true Coprolites from the pebbles, with which they certainly are sometimes associated. He adds, "a very slightly-practised eye could never make the mistake,"—and yet, Sir, the very specimens which I examined (and nearly half of which were but pebbles), were all exhibited on the table of the Geological Society as true Coprolites, and no one doubted but that they were so. From this fact, I think it may be inferred that, in some cases at least, the difficulty I allude to might exist. With respect to attrition accounting entirely for their rounded form, I did not intend giving that as my opinion, but that it has something to do with it is evident, from their being found on the beach associated with pebbles harder than themselves, in which situation, and in such company, it must infallibly happen that, moved by the ebbing and flowing of the tides, attrition must be the consequence.—*W. H. Potter.*

Zinc Vessels for the Dairy.—I have read a statement quoted from high authority that milk kept in zinc vessels is likely in summer, even within a very few hours, to become deleterious, by dissolving and holding in solution portions of the zinc. If this be so, the fact should be generally made known; for the substitution of zinc for leaden vessels has of late become frequent with dairymen on account of the less cost of the former, and their supposed quality of causing the separation of a greater proportion of cream. If any of your chemical friends can throw any light upon this subject, I, for one, shall be much obliged.—*A Dairyman, Aylesbury.*

Time of Manuring Grass-Land.—What is the best time of the year for applying farm-yard manure to Grass-land? there is a great variety of opinion, as well as practice, in this neighbourhood. Most people here seem to prefer putting it on in the spring, the objection to which is, that should the spring prove a dry one, the manure gets its goodness dried out of it, does very little good to the crop, and is a great annoyance in hay-time; others apply it late in the Autumn (after they have eaten off their after-grass), and then vegetation being dormant, the best of the manure is washed away and carried off by the drains without being of any service whatever. Here, with the help of irrigation and stimulants, I am able to get two crops of hay in the year, and my plan is, to put in the manure from the farm-yard as soon as the second crop is cleared, say in the middle of August; if, however, the weather should be dry at the time, it is not spread, but left in the heaps until the rains set in, when it is immediately spread, and at that time vegetation is so vigorous, that it is out of sight in a very short time. It appears to do so much more good that I think even when only one crop is obtained it is better to lose the after-grass (or the pasturage of it) rather than lose almost all the benefit of your manure; and so great is the difference produced between manuring in August and October, that here the former was grown over, and out of sight in a fortnight, while the latter is still as visible as on the day it was applied, and the stimulus it has given to vegetation is scarcely perceptible. It is much to be wished that some of our expert operators would turn their attention to hybridizing some of the Cerealia. I think that spring Wheat may be crossed with some of the more valuable kinds, and, if so, there is great reason to hope for early and good varieties.—*T. G.*

Large tracts of improvable land in various parts of England lie waste, only awaiting the application of skill, capital, and labour, to give an ample return for such expenditure. We have modern companies formed, and forming, for great efforts. Capital is abundant, and combined endeavour, the feature of our day. Could not a company be established for the cultivation of these waste portions of our island? "A National Agricultural Company," enlisting public confidence by the integrity of its directors and the cordial co-operation of our wealthy and enlightened nobles and commoners, would be most useful and profitable; and I scarcely need point to the gratitude and blessings which would be elicted from labourers, by such an undertaking wisely and judiciously conducted. Small landed proprietors, also, would cordially support such an endeavour to redeem the waste lands of England from the useless condition in which they at present lie.—*H.*

Bones.—In your *Agricultural Gazette* of the 13th inst. there is an article signed "E. R., Halifax," on the subject of boiled or unboiled bones, and in it he states "he had had a conversation with a respectable Scotch farmer in Roxburghshire, and having inquired of him if bones were still in great estimation in his neighbourhood, he replied, that for the last three or four years the farmers had neglected them altogether." I beg leave to state that your correspondent has been in this respect misinformed. I am a seller of bone-dust, and can prove during the last three or four years I have sold in the counties of Roxburghshire and Berwickshire a very large quantity. And I may add, with the exception of guano, that easily-adulterated manure being in some instances tried as an experiment, bones will be held in as great estimation as ever they were.—*Patrick Clay, Berwick.*

Destroying Thistles by Salt.—If a small quantity of common salt, say about a tea-spoonful, is taken between the fingers and thumb and placed on the centre of the Thistle, in a day or two it will turn black, and in the course of nine or ten days the root and every part of the plant will be destroyed. This is a cheap and certain method of destroying Thistles on land. One person will

salt as many as five or six will cut up in the usual way. The salt should be applied before the Thistles have attained a large size, and great care must be taken that it is not dropped amongst the Grass or other herbage, as it will destroy it also.—*J. M. T., Hillsborough, Ireland.*

Manure.—Besides giving a list of manures appropriate to each description of plants, it might be possible to establish the quantity requisite for each. Thus, supposing a plant grown in an inferior soil, a good plant of Wheat is found to contain certain ingredients in certain quantities, while on the soil in question it is found to contain only so much of some of them. Might not the soil be analysed, and such a proportion of suitable manure be added to it, as guided thus, we may assume to be required? If this could be done, each field in a farm, when analysed, might be registered, and thus there would be a ready and accurate means of knowing how to prepare a particular field for a particular crop. Something of this kind is already done by almost all farmers, but not upon sufficiently scientific principles. We know that this is also done, in a measure, by draining, by ploughing, by exposure of the soil either to heat or frost, and by various other means, which will all readily present themselves to the mind of a practical man. If I am correct in my theory, I should think that when a superabundance of any ingredient existed, which was not suitable to a particular crop, it might be temporarily neutralised by a manure of a suitable kind.—*M. B. G.* [We refer our correspondent to Dr. Daubeny's lecture on the application of science to Agriculture, in the 3d vol. of the "English Agricultural Society's Journal."]

Experiments on Manures.—I beg to forward you the results of an experiment made by myself, on a small scale, with some of the more simple fertilizing agents. The ground I had to work upon was in the corner of a field of very poor, sandy loam, with a mixture of cold clay. Eight perches, manured with 8 bushels of soot, produced of Carrots, 12 cwt.; 8 perches, manured with the scrapings of a wood-yard into which pigs and geese occasionally intrude, but which consisted mainly of well-decomposed sticks and leaves, and which was spread on the surface to the depth of 4 inches, produced of the same crop, 14 cwt. The same quantity of land, manured with 8 bushels of lime, 8 cwt.; 4 perches, dressed with the leaf-manure 6 inches thick, of Beet-root, 5 cwt.; while the same quantity of land, without manure, gave only 2 cwt. In reference to Beet-root, I may be permitted to remark, that it was proved here by experiment on the milch cows that those fed on this vegetable gave much better cream, and in larger quantity, than those fed on Hay, Turnips, Carrots, or Parsnips; and it has often been matter of surprise to me that the above-named root is not extensively cultivated by Agriculturists, since it contains abundance of saccharine and other nutritious matter, is eaten by all animals with avidity, and is of most easy cultivation.—*J. L. Snow, Swinton Gardens.*

Berberry Blight.—The mealy blight observed by your correspondent on the Berberry, is, Erysiphe penicillata, a very curious object under the microscope. In its early stage of growth, like other species of the genus, it has been described as an Oidium. The mildew on Peach-trees is, I believe, the same species with that which grows on Rose-trees, but it is very rarely perfected; though I have gathered full-grown specimens of Erysiphe pannosa late in the autumn on Peach twigs. This fungus is far more distantly related to the mildew of Wheat than the rust-coloured Berberry blight; therefore, if there is any connection between the two diseases, it must be one of a more remote nature. It is not, however, probable that it has anything to do with the question; for other plants, when covered with a species of Erysiphe, have never been observed to be injured.—*M. J. Berkeley.*

Flavour of Butter.—At this season of the year at least one-half of the butter made in the Agricultural counties is rendered disgusting to many, and more or less offensive to all palates, by the flavour of Turnips. The following is an old-fashioned but complete "antidote to the flavour imparted by Turnips to milk, cream, and butter." Make the strongest infusion of nitre, by pounding it in a mortar, and pouring boiling water upon it. Let a dessert-spoonful of this solution for every two gallons of milk be stirred up in the warm milk as soon as it is brought in, and all flavour of Turnips will be removed.—*A Wrasleydale Dairyman.*

Manure dropped in the Field.—Mr. Billington's remarks on this subject in your last Paper are very judicious; but the system he proposes, in my opinion, scarcely goes far enough, and appears chiefly adapted to small farms; besides that, his plan of spreading the droppings every day is liable to the objection that the action of the sun and wind will cause the evaporation of much of their richness, before the land can be benefited by it. I shall now proceed to detail a system I have pursued during four years with the greatest success, with manure dropped in the field. On one hundred acres of pasture-land, stocked with about sixty head of cattle, an old man and a boy collect all the manure dropped, and wheel it into heaps in convenient parts of the fields, where it is mixed with an equal quantity of soil (scourings of ditches, road-scrapings, or any other refuse, will do for this purpose), and every evening each heap is covered with soil to keep in all the moisture; the man and boy also take up all thistles and other weeds, and repair any fences that may be broken by the cattle. These heaps are laid on the poorest parts of the fields in winter time, at the rate of five tons per acre—this manure being so rich that if more is applied, it causes the grass to become so rank during the following summer, that the cattle will not touch it. The manure is carefully spread, and early in spring the land both harrowed and rolled. The results of this system are: 1st, all coarse tufts of Grass gradually disappear, and the Grass near the hedges becomes as sweet and palatable to the cattle as that in any other part of the fields; 2d, the land carries more stock; 3d, all weeds are eradicated, and their place supplied by good herbage. This year 18 acres have been manured with the droppings collected on the 100 acres mentioned above. The expense is as follows:—

	£	s.	d.
Wages of an old man and boy from May 10th, to Nov. 10th, (26 weeks); the man 9s., the boy 4s. 6d. per week—13s. 6d.	17	11	0
90 tons of good manure, sufficient to manure 18 acres at 6s.	27	0	0
Gain	£9	9	0

The practice of gathering and heaping the manure dropped in the fields has been long known to the Leicestershire and Northamptonshire graziers, from whom I borrowed the plan, merely adding the soil which, in my opinion, is a great improvement. So convinced am I of the great benefit derived from this practice, that it is my intention to adopt it on the whole of my grass-land, and I confidently recommend it to the notice of my brother farmers. —*R. F. S., Yorkshire.*

Gluten in Grain.—You quote from "Smith's Productive Farming" on this subject. It is true that the mode of cultivation may and does give rise, in some degree, to the different quantities of gluten in Wheat, Rye, and Barley; but from the article you quote it may be inferred that this is the primary, if not the only cause, which is not the fact. Climate is the principal cause of the difference of quantity of gluten in Wheat, as may be proved, if not by theory, by observation. We all know that for making biscuits Wheat is required with but a small proportion of gluten; thus we find Scotland produces flour famous for biscuits; and Naples produces flour famous for maccaroni, which requires a preponderance of gluten, and this flour contains so much gluten that bread from it is not good; hence the invention of maccaroni by the natives as a substitute for the bread of colder climates. I am aware that this observation does not accord with Sir Humphry Davy's statement of quantities of gluten in Wheat grown in different countries; thus he gives—

French Wheat	12 per cent. of gluten.
Bavarian Wheat	24 per cent. ,,
English Summer Wheat	24 per cent. ,,
Do. Winter do.	19 per cent. ,,
Sicilian	21 per cent. ,,
Barbary	19 per cent. ,,

In all the above examples the climate where the Wheat was grown should be ascertained; for example, to talk of French Wheat is an indefinite mode of speaking; it is French whether grown in the north or south, which possess vastly different climates, and a similar observation may be made on the other examples, for in every country climate depends on altitude, therefore the above examples say but little towards the establishment of any theory; but I believe it may be established by observation as a general rule that the cold climates produce the smaller quantity of gluten in Wheat, and the warmer the greater quantity.—*J. G.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover-square on Wednesday last, the 7th of Feb.; present, the Right Hon. Earl Spencer, President, in the chair; his Royal Highness the Duke of Cambridge, his Grace the Duke of Richmond, Viscount Torrington, Hon. Robert Henry Clive, M.P.; Hon. Captain Spencer, Col. Austen, T. Raymond Barker, Esq., Samuel Bennett, Esq., W. R. Brown, Esq., French Burke, Esq., Colonel Challoner, F. Clifford Cherry, Esq., H. C. Compton, Esq., M.P.; Layton Cooke, Esq.; J. Evelyn Denison, Esq., M.P.; Humphrey Gibbs, Esq.; B. Brandreth Gibbs, Esq.; Stephen Grantham, Esq.; W. Goodenough Hayter, Esq., M.P.; W. Fisher Hobbs, Esq.; John Hudson, Esq.; W. H. Hyett, Esq.; John Kinder, Esq.; Fielder King, Esq.; William Miles, Esq., M.P.; Philip Pusey, Esq., M.P.; Francis Pym, Esq.; Professor Sewell; William Shaw, Esq.; J. Villiers Shelley, Esq.; and H. S. Thompson, Esq.

The minutes of the former monthly and special councils having been read, G. J. Bosanquet, Esq., of Broxbourn Bury, near Hoddesdon, Hertfordshire, was elected a Governor, and the following gentlemen Members of the Society:—

Kerrick, Edward, Arnolds, near Dorking, Surrey
Wray, John, 6, Suffolk-place, Pall Mall, East
Langdale, Marmaduke R., Mountfield, near Tonbridge Wells
Spurgin, Dr., Orplands, near Bradwell, Essex
Rogers, Longdon M., E.I.C. Service, Fitzroy Cottage, Highgate
Hankin, W., Heller's-place, Bentworth, near Alton, Hants.
Meggison, George, 61, Cannon-street, City
White, James, Goverland Farm, Isle of Wight

The names of candidates for election at the next meeting, amounting to 91 in number, were then read, together with the names of the members on whose proposition they were respectively nominated to the Council for admission into the Society.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, presented to the Council the monthly report on the state of the funds of the Society, from which it appeared, that on the 31st of January the current cash-balance in the hands of Messrs. Drummond, the Society's bankers, amounted to 1,870*l.*, and the stock invested in the names of the trustees of the Society to 7,700*l.* The Report also announced the extensive distribution of the Cottage Tracts on Gardening and Cookery, among Agricultural labourers, through the medium of Members of the Society; the addition of Mr. Brandreth Gibbs and Mr. W. R. Browne to the House Committee, and the reception of a communication from the Certifying Barrister of Friendly Societies, informing the Council that the Society had been included in the list of institutions entitled to exemption from county, borough, parochial, and other local rates on land and buildings.

Conditions on Resignation.—The chairman of the Finance Committee then called the attention of the Council to the following paragraph in conclusion, of the report:—"The Committee have had submitted to them the list of members expressing their desire to withdraw from the Society; many of whose letters contain simply an expression of such desire, while others assign reasons for their so doing, at variance with the fundamental rules of the Society. The Committee feel it their duty to recommend to the Council the acceptance of such resignations, upon the payment of the subscriptions due; but submit to the council that they cannot recognise such reasons as grounds for their withdrawal." The question was then put from the Chair, and the whole of the Report was unanimously confirmed by the Council.

Southampton Meeting.—Communications were received, and referred to the General Southampton Committee, from Mr. Mayes, the chairman of the Local Committee of the Corporation, expressing the readiness of the authorities at Southampton to co-operate with the Society in the preparations for the meeting; from Colonel Le Couteur, president of the Jersey, and Mr. Dobrée, president of the Guernsey, Agricultural Society, explanatory of conditions connected with the exhibition of cattle of the Channel Islands' breed; and from Mr. Matcham, agent of the South-Western Railway, offering to contract for the conveyance of all goods and implements, from the terminus of the Railway to the Show-Yard. Mr. Cuthbert Johnson presented to the Council the draft of a bill "to authorise the Society to inclose common or other open lands for the purposes of Show-Yards; to protect their property, and to suspend during a certain period the privileges of those who possess rights of common, and other claims to the land which may be from time to time occupied by the Society." The Council resolved, that their best thanks should be returned to Mr. Cuthbert Johnson, for this instance of his attention to the interests of the Society; but that having the assurance of unanimous votes of the commoners at two public meetings, convened by the Mayor, at Southampton, for the consideration of the question, and a full confidence in the cordial feeling manifested towards the Society in the promotion of its object at the ensuing meeting in July, by the inhabitants of that town and neighbourhood, they think the measure proposed would in every point of view be inexpedient.

Entry for Exhibition.—Mr. Raymond Barker, as Chairman of the Special Committee, appointed by the Council to inquire into the case of the parties charged with an attempt at the Derby Meeting to effect the entry of a churn by improper means after the date of entry had expired, and who had consequently been declared disqualified for future exhibition submitted to the Council the result of their inquiry. The report stated the explanation offered personally by the representative of the parties in question before the Committee, and concluded with the following paragraphs:—"Under all the circumstances, the Committee regret that they cannot find sufficient cause to recommend to the Council any alteration in their decision made on the 4th of August, 1843. The Committee are further of opinion that no by-law on the subject referred to them need be introduced, inasmuch as they conceive that whenever a case of fraud or gross impropriety is satisfactorily made out, the Society would, as a matter of course, without the authority of any by-law, visit such offence with its highest displeasure, and so far as it has authority, with punishment."

West Indian Agriculture.—A letter was read from the Rev. Dr. Stewart, Hon. Secretary of the Jamaica Agricultural Society, requesting the favour of communication with the Society in reference to the common objects of Agricultural interest in England and the West Indian Colonies respectively; and this request being referred to the Journal Committee, the General Agricultural Association of Jamaica was declared a corresponding institution, and the Journals of the Society ordered for the Jamaica Association accordingly.

Library and Museum.—Mr. John Robert Hall, of Grove-end Road, St. John's Wood, offered to place at the disposal of the Society, at a valuation, the agricultural library of his brother, the late Mr. Webb Hall, of Bristol, originally formed by Mr. Arthur Young for the Board of Agriculture, and bestowed, on the discontinuance of that Board, on Mr. Webb Hall, their Secretary, in compensation for the loss of office he thereby sustained. This offer was referred by the Council to the consideration of the Journal Committee. Mr. Jardine, as executor of the late Rev. W. L. Rham, presented to the Society a Flemish plough, imported as a gift to the Society by Mr. Rham, and at present lying at the Custom-house. This present was accepted, with the best thanks of the Council. A letter was read from Mr. Agnew, of Manchester, expressing his hope to be able to present to the Society the large painting of the Society's trial of Implements at their country meeting, and which had been painted for him at an expense of 1000 guineas. The Duke of Richmond presented, on the part of Mr. Lewis, a map of Southampton, on a large scale; Mr. Layton Cooke, a copy of his work on the Value of Landed Property (illustrated by diagrams); and the Yorkshire Society a copy of the last part of their Transactions; for which, and numerous other presents, the best thanks of the Council were ordered. The Council decided that Dr. Playfair, as Consulting Chemist to the Society, should be requested to analyse, under the direction of the Journal Committee, the specimen of marl transmitted to the

Society by Mr. Trimmer as retarding, when present, the operation of bone-dust as a manure for land. The Council then adjourned to Wednesday next, the 14th of February.

FARMERS' CLUB.

Chesterton, Feb. 3.—The first monthly meeting of this club took place on Monday the 29th ult. The subject for discussion, "the best method of summer-feeding farm-horses," was introduced by Mr. J. Sandford, of Mountain, who read a paper from which we extract the following:—

"The best and cheapest method of keeping farm-horses through the summer is to feed them on Lucerne. You will be enabled to cut the Lucerne three or four times through the summer; so that I think two acres of land of middling quality will be sufficient to keep four horses five months in the summer; and I should give the Lucerne to the horses out of doors; I mean in cribs in a fold-yard where there is a shed, instead of in the stable; this being, I think, more healthy for the horses, and it is less trouble also. I prefer Lucerne to any other summer food, knowing it is quite as good, or better keep than Vetches; and it is also much cheaper, and when you have once got a fair plant of Lucerne, it is much more sure than Vetches, the winter or slug sometimes destroying the Vetch-crop, but not the Lucerne. Lucerne will last in the same land 20 years in as great vigour as ever, mowing three and sometimes four times in a season. Its cheapness will be evident from the following calculation:—Take four acres of middling land for Vetches, which I consider equal to keep four horses five months. Now I shall charge two of these acres at half the full rent, &c., because the Vetches will be off in time to sow Turnips, and the other two acres I shall charge at the full rate, being too late to sow Turnips; and I shall take two acres of Lucerne, which I consider equal to keep four horses five months, the same quality of land, and at the same price per acre:

Two acres for Vetches, including rent, tithes, and taxes, at 30s. per acre	£3	0	0
Two ditto ditto cleared for Turnips	1	10	0
Seed for four acres, 10 bushels at 7s.	3	10	0
Sowing and harrowing four acres at 5s.	1	0	0
Cutting four acres	0	8	0
	9	8	0
Per horse for five months	£2	7	0

Two acres Lucerne, including rent, tithes, and taxes	£3	0	0
Cutting three times, 2s. per acre	0	12	0
Allowance for seed per year	0	4	0
	3	16	0
Per horse for five months	£0	19	0"

The discussion then turned on the best manner of cultivating Lucerne. Mr. John Sandford and myself advocated the broadcast system, one of our reasons being that we consider hoeing likely to injure the crown of the root, which in this plant spreads considerably after the first year, and sends up shoots all round; and provided the land is quite clean when the Lucerne is sown, we think that it is likely to thrive better for any little surface grass that may come among the plants, as this tends to keep the ground cooler, which we consider preferable to exposing the surface of the soil to the hot summer sun. Several of the members stated they had tried manure on Lucerne without any apparent effect. I manured two ridges with guano last summer, at the rate of two cwt. to the acre, but there was no visible effect produced on the Lucerne plant.—*A. Hall.*

Reviews.

Advice as to the proper Management of your Farms. Dublin: N. Clarke, Printer, 50, Great Britain-street.

This is a handbill which has been printed for circulation among the small farmers of Ireland.

The writer of this paper opens his subject thus:—"The manner in which you manage your farms at present is so bad that the land is not improved, and the rent is paid with difficulty. It is generally this,—you manure for a crop of Potatoes, then take as many Corn-crops as the land will bear, and then let it out to rest."

He then states that in Scotland and England this system has been generally abandoned, and it has been found possible to keep the ground constantly giving crops, and yet improving by growing Corn and green-crops alternately, the latter being manured. Food, he further states, is economized and manure saved by the practice of house-feeding. "With proper management two acres ought to feed three cows all the year round," and "the produce of butter alone ought to pay your rent, and leave the Pigs, Corn, and Potatoes for your own consumption."

Four different courses of cropping are then suggested, varying according to the size of the farm.

On a very small farm the course recommended is,—1st year, Potatoes in drills, with Cabbages planted between in June; 2d year, Oats laid down with Clover; 3d year, Clover, for soiling; 4th year, Oats, followed by Rape, and Vetches followed by Turnips. On a farm of six acres the course is to be a little varied; and on a larger farm a seven-course system is recommended for adoption. Valuable advice follows on the preservation of every description of solid and liquid manure produced, and on the use of bone-dust and lime, the application of the former of which, it appears, would cost the Irish farmer 5*l.* per acre.

Lastly, we have instructions for the cultivation of Potatoes, Mangold-Wurtzel, Turnips, Rape, Cabbages, Wheat, Oats, Barley, Red Clover, and Vetches.

Without a practical knowledge of the soil and climate of Ireland, of the system of culture generally adopted by the small farmers, and of their circumstances, it would be rash to offer an unqualified opinion on the advice given to them in this paper. Still we can scarcely err in acknowledging that the system it recommends, in its general principles, may be applied to a considerable variety of soils, and is one of the best that a small farmer could pursue.

The grand feature of the system is the growth of green and Corn crops alternately, so that an abundant stock may be carried, and a good supply of manure produced on the land. The principle of the alternate system is recognised as sound by the best farmers of England, but it is far from being generally adopted. There are districts which produce comparatively little but Corn, and in which the soil is said, probably with reason, to be too stiff for the growth of Turnips. Many such soils would be greatly altered in their texture and converted into friable loams, by thorough drainage and deep perfect cultivation. We cannot hope, however, to see them thus improved without great additional capital being applied to them, and this additional capital will not be applied without good security for a return. It is astonishing how much capital might be applied with advantage to a small quantity of land, if there were a certainty that the cultivator would reap the full fruits of his capital and industry; and we do not believe that the practice of Agriculture will be much further improved in this country till measures of some kind are adopted to give full scope for the employment of capital, knowledge, and industry in the thorough cultivation of land. Theoretical knowledge of Agriculture may be increased, but how is the farmer to apply his knowledge without the requisite means and the requisite security?

Those in the situation of the small Irish farmer, holding but a few acres of land, are, perhaps, the most likely to improve it in a high degree, if placed in a right position. Their land should be thoroughly drained; they should adopt some such system of cropping as that recommended in the paper before us, and they should cultivate their soil thoroughly by the spade or fork. What business has a plough on a farm of six or seven acres? However desirable or necessary this implement may be on a large scale, it must be generally acknowledged that it is an imperfect machine, and that although, like other machinery, it will enable a man to accomplish more work in a given time than the simpler tool, it will not enable him to perform that work better or even equally well. A soil which has been thoroughly worked to a depth of 12 or 14 inches with the spade is in a state to which repeated ploughings would not bring it, even if the subsoil-plough were used, while the expense of cultivating land with the plough and subsoil-plough to a good depth is little, if at all less than would be incurred by manual labour.

The writer of the paper before us recommends that Rape be sown in June, and transplanted after the Corn-crop, to afford food for winter and spring. I have never tried this plan, but I have transplanted Swede Turnips to follow Vetches, and I think the practice in some cases a good one. A small seed-bed will supply plants for an acre. The seed should be sown in the spring thickly, and the Turnips transplanted when about the size of young Cabbage-plants, care being taken that the root is put into the ground straight, and not bent at the tip. If this precaution is not observed, the growth of the root will generally be much impeded, or altogether stopped. The chief advantages of this practice are, that the ground is not required till much later for the crop, and all risk of serious injury from the fly is obviated. With respect to Rape, the following circumstance may be mentioned:—A small patch of Rape was sown, for an experiment, about the latter end of September, 1842. It went to seed in the spring, but about the end of March the first crop was consumed. Liquid manure was then applied, and the ground was loosened between the rows; and about the latter end of May another good crop was taken. The ground was shortly afterwards broken up. This experiment indicates that Rape would be valuable as an early crop for cows or sheep. Although light, it occupies the ground at a season when it can be best spared. It would probably not be desirable, however, to take more than a first cutting in March.

Although bone-dust is undoubtedly a powerful manure, and may be a desirable application to some land, yet for farmers who have plenty of manure from their stock, as those following the proposed system would, the expediency of applying it at an expense of 5*l.* per acre must be very doubtful.

The cutting of Potato-sets is alluded to. Ought Potatoes to be cut, or planted whole? Has this question ever been definitively set at rest? The results of an experiment which was performed in our neighbourhood favoured the practice of planting whole, but no safe conclusion can be grounded in Agriculture upon a single experiment, and that, too, on a very small scale. We should like to see the relation between the size and state of the Potato-set, and the vigour of the future plant accurately determined.

A brief summary has now been given of the contents of this valuable paper; the leading principles of the system of culture it recommends have been pointed out, and a few remarks suggested by some of its details have been offered. It is well worthy of being circulated among the small farmers of Ireland, and of England also. If there is one point in which the advice is defective, it is in the omission of a recommendation to cultivate the ground with men and spades, or forks, rather than with horses and ploughs.—*H. F. F.*

Miscellaneous.

Mode in which Manures act.—It has been most satisfactorily proved that there are at least two distinct ways in which manures may produce crops. 1st. It may itself yield the elements of the crops, and hence, in this instance the crop is merely the manure in a different form. Or, 2d. It may enable the crops to obtain their elementary ingredients with greater facility from the soil, in which case, of course, the increased crop, though produced through the agency of the manure, is really obtained at the expense of the soil.—*Dr. Madden on the Advantages of Extended Chemical Analysis to Agriculture.*

Recipe for Wounds, &c.—I can with the greatest confidence recommend the following recipe for cuts, gall, and broken knees. Compound Tincture of Benzoin, Tincture of Myrrh, each one ounce, Nitrous Acid two drachms—mix in a bottle for use. Apply with feather or syringe if the wound be deep.—*H. F. Odlum.*—*Dublin Farmer's Gazette.*

Application of Manure to Turnips.—The following Table shows the result of an experiment, alluded to in a former report, in growing Swedish Turnips with four different kinds of manure, which was this season made by Mr. Grieve, the intelligent land-steward of Mrs. Ferguson of Dirleton, and on whose perfect accuracy every confidence may be placed. The Turnips were sown on the 20th of May, and lifted and weighed on the 27th November last. The field on which they were grown had, until lately, been time immemorial in Grass, the soil being a dry friable loam. The value of the different manures speaks for itself; but it should be noticed that where the guano was used the Turnips seemed to braird more rapidly, were earlier ready for the hoe, and kept ahead of the others to the end, as if they had been sown at least a fortnight sooner.

Kinds and Quantities of Manures used per acre.	Price of Manure per acre.	Weight of Turnips, without roots or tops.			Weight of roots and tops.			Weight of rotten Turnips.			Weight of Total Produce per acre.		
	£ s.	Tons.	Cwts.	lbs.	Tons.	Cwts.	lbs.	Tons.	Cwts.	lbs.	Tons.	Cwts.	lbs.

Notices to Correspondents.

Our Correspondents will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

Communications from the following Correspondents are in type, and are only waiting till room can be found for them:—*A Subscriber, A Perthshire Farmer, T. E., G., J. Caird, F. M., A Surrey Farmer, Yeoman,* and *A. Hall.*

Agricultural Chemistry.—*T. Butler.*—Analyses of soils are rarely useful, unless they enter so perfectly into detail, and therefore require such skill, as entails great expense upon the operation. It is very questionable, we think, whether gentlemen, though of known ability, would obtain sufficient practice in this way to justify them in devoting their whole time as Agricultural chemists.

Agricultural Gazette.—*Bungay.*—Send us a post-office order for 6*s.* 6*d.*, and we will take care that you are supplied at that price.

Application of Lime.—*An Amateur Farmer.*—You are right in not applying lime at present to the land under the circumstances which you describe. But you have, we think, trenched your land rather too boldly. You should have kept the top soil uppermost. However, the 60 yards of manure per acre will probably give you a good crop of Oats and Grass.

Burthens on Land.—*An Inquirer.*—We cannot obtain for you the actual sum per acre to which these on an average amount in England and Scotland; but the advantage which Scotch farmers possess over English in this respect, probably does not lie in their average payment as rent, being less for similar land. The amount of poor's-rate, road and church-rates, &c., as well as the annual sum paid to the landlord, are all taken into account by the English farmer before he enters on his farm, and they must, therefore, all be considered as rent, and this rent will be found generally to be proportioned *alike* in England and Scotland, under similar circumstances, to the quality of land. But the advantage possessed by the Scotch over the English farmer lies in his rent being generally variable according to the price of produce; while of that paid by the English farmer, the landlord's portion is almost universally a fixed money-payment; while of the rest, which is sometimes the larger half, the greater part—that paid to the poor—varies *inversely* as the price of produce, being greatest in amount when Corn is lowest. You were right, when speaking of the burthens on the English farmer, as compared with those on the Scotch, in calling them "vexatious" rather than heavy.

Drainage.—*James Denham.*—Please to give the address of the party who would give the required information.——*A New Subscriber.*—We are aware of no work exclusively upon the drainage of high lands. On drainage in general, see a pamphlet by Mr. Smith, of Deanston, and an Essay in the present Number of the English Agricultural Society's Journal. We should be glad to publish a statement specifying the character of the land, that of the limestone, &c., and the amount of benefit derived from the practice of manuring your vale lands with crushed limestone. We never heard of the practice before, with a compact limestone. We doubt whether, where coal is so near, burning lime is not the cheapest method of reducing it to powder. Low's "Elements of Practical Agriculture" is one of the best general treatises on the subject. Those you allude to are, however, both valuable works.

Dressing for Mossy Land.—*H. W. B.*—If you have not good farm-yard manure apply lime. The rushes will gradually disappear if the land is efficiently drained. If, instead of burning the refuse bark of the tan-yard, you were to soak it with liquid manure, you would obtain a valuable compost.

Gas-water.—*Wm.*—Soak the tan with gas-water, and turn it frequently. The addition of sulphuric acid to the water will form in it the sulphate of ammonia. We do not know how this is manufactured on the large scale, but will endeavour to ascertain for you.

Gold of Pleasure.—*Anonymous.*—"Almost all Cruciferous plants yield more or less of oil. One of these, Camelina sativa, cultivated Camelina (Gold of Pleasure), is a plant produced in various parts of Germany and Italy for this purpose. This plant is an annual, and is raised with facility. It grows spontaneously over a great part of Europe, and is a frequent weed amongst Flax. It grows best on light, sandy soils, and in the south of Europe two crops of it can be produced within the year. The oil it produces is said to be fine in quality, retaining a good flavour, and in burning it does not

produce any disagreeable odour. In the south of Europe it is sown in April or May, and is sometimes ready in less than three months, so that it is one of the quickest-growing of the oleaginous plants. The seeds are sown thin, and the plants hoed, if too thick. It is pulled or cut, and laid in a covered place, to complete the ripening and drying of the seeds. These being then freed from the stalks, by beating, are winnowed, dried, and bruised."—*Professor Low's Elements of Practical Agriculture.*

Gorse.—*J. B. N.*—Old bushes must be cut or burnt down, and the young sprouts used as food.

Guano for Potatoes.—*R. T H.*—See our answer to *A Young Rural*. If your land is in anything like good condition, you may expect a good crop of Oats after the Potatoes; but you should aim to get your crops, and especially your grain-crops, to depend a good deal upon the general condition of the land, rather than upon the particular manuring of the year.

Inorganic Constituents of the Onion Tribe.—*T. Price.*—We have been informed, since last week, of an analysis of the Onion performed by Fourcroy and Vauquelin. A large quantity of uncrystallizable sugar was found in recent Onion juice, together with mucilage and the phosphate and nitrate of lime.

Liquid Manure.—*S. L. B.*—Apply liquid manure to Grass in April, and to growing crops of roots or Corn in the early stages of their growth.

Malting Barley.—*J. B. N.* recommends the trial of chloride of lime in solution, as a steep for Barley, to force on the sprouting. It would have this effect, but we doubt whether it would not at the same time injure the Malt.

Manures.—*Villager.*—Nothing is better than good and well-made farm-yard manure; apply it at the rate of 20 cubic yards an acre; plough or dig it in.——*Carlisgill.*—Differences in the effects which follow apparently similar applications cannot be accounted for except by one who knows accurately the composition of the soils on which they were made, &c. The immediate contact of lime will injure the action of the guano by so much as that action depends upon the presence of salts of ammonia, for lime will displace ammonia from any of its salts and volatilise it. And to this probably the difference between you and your neighbours in your experience of guano is owing. We believe urate is made by soaking gypsum in the water of the stables and feeding-stalls.——*A Young Rural.*—Smithy ashes are hardly worth going for; they may, however, be usefully applied to strong land. They are not worth more than 1*s.* per cart-load. Tanners' bark, when burnt, makes good wood-ashes, and it is then fit to mix with guano for a Potato-crop; but we should prefer soaking the rotten tan with liquid manure, and then mixing 3 cwt. of guano with 10 cart-loads of it as a manuring, in the ordinary way per acre, for Potatoes. 6*d.* per bushel is a fair price for soot, and the same for wood-ashes. Two of soil and one of guano would make a good mixture, but try rotten bark soaked with urine, instead of earth. You should have applied your guano to the Turnips before the Barley, and these should have been eaten off with sheep; you would then have been sure both of Barley and seeds. As it is, if your land is in good order, you may depend upon the guano for the seeds. We shall give an account of the cultivation of the Parsnep before the season for sowing it.

Markets.—*G. C. R.*—We are much obliged by your anxiety to set us right on this subject—correctness in market reports is of first importance to an Agricultural paper; but to show you that precise accuracy in the actual prices quoted is not of so much importance as accuracy in describing the general state of the markets, as to whether prices are falling or rising, we may mention that within the past fortnight we have sold nearly 100 quarters of good white Wheat, averaging 61 lbs. a bushel, at 49*s.* This is 100 miles from London, and probably the majority of our readers are at a still greater distance, where prices, though they may rise and fall with those of Mark-lane, as they do here, are even less likely to resemble them in actual amount. Do not infer from these remarks that we are not fully anxious to report the Markets correctly. We cannot suppose that Messrs. Kingford and Lay would append their names to an inaccurate statement; mistakes may, however, have been accidentally made in it, and we shall communicate with those gentlemen on the subject. With regard to the publication of a Farming Calendar, we shall endeavour to supply its place, this year, at any rate, by making our Leader have a general bearing upon the operations of the season.

Mineral Manure.—*John W. Lloyd.*—We have seen your analysis before, published in the *Derbyshire Courier*. If you were to take a specimen of any ordinary soil, you would find on analysis that it contained all the ingredients mentioned as existing in your rock, and the most valuable of those ingredients in larger quantity. Is the soil above this rock extraordinarily fertile? It must be so, if your theory is correct. Our opinion is, that your land would not benefit much by an application of it, though ground to a powder. We shall return to this subject at greater length hereafter.

Plants for Ploughing in as Manure.—*L. Stephenson.*—We can recommend nothing better for this purpose than the common Tare or Vetch. It is commonly used in this way here, by poor people, as a substitute for manure in their gardens. They obtain seed from those who have been accustomed to sow it early in autumn. You had better obtain some which has thus acquired hardiness and a habit of early growth; and if you sow early, you may dig or plough it in by the 1st of May.

Potatoes.—*J. H. H.*—Farm-yard manure is most likely to be the best application, because it is the most compound of any. An analysis of the soil is not likely to be sufficiently delicate to point out the deficiency. If the land is tired of Potatoes, you should grow other crops on it for a while. The tubers contain in 100,000 parts, 390 of potash, 234 of soda, 33 of lime, 32 of magnesia, 5 of alumina, 2⅜ of iron, 8½ of silica, 54 of sulphuric and 40 of phosphoric acids, 15¼ of chlorine, 37 of azote, and 99,006 of water and carbon (Sprengel). We do not know any analysis of the leaves.

Salt and Soot.—*A Subscriber.*—The usefulness of salt as a manure depends on your soil being destitute of it. If you are in an inland situation, 1 cwt. per acre may be beneficially applied. Try it mixed with the manure in your compost heap. 30 or 40 bushels of soot per acre is the usual application. Crosskill's clodcrusher is stated by some of the writers in the current No. of the "English Agricultural Society's Journal," to prevent the ravages of the wireworm; we have no experience on this subject ourselves. No previous steeping of seeds will ensure the safety of the plant.

Steeping Seeds.—*Rusticus.*—See answer to your question above. It will answer very well to soak earth, sawdust, refuse bark of the tanyard, &c., with the solution of superphosphate of lime. ——*Gentleman Farmer.*—We hope to hear from Mr. Campbell on this subject shortly, and will then answer you fully. Meanwhile, we think Oats should be soaked as long as Wheat, Turnip-seed as long as Clover, Mangold-Wurtzel 24 hours; Beans, Peas, and Tares, at least 48 hours; but you can try this in a wine-glass yourself some days before you sow in the field, stopping the soaking when the seed begins to swell. 100 lbs. of Wheat will take up 3 or 4 lbs. of any salt in a sufficiently strong solution. A bushel of Wheat, weighing 60 lbs, will only take up 2 or 3 lbs. In order, however, to be sure that you have enough, take 5 lbs. of the salt, and dissolve it in such a quantity of water as will perfectly cover the seed, and then place the bushel of seed in it. The "exact neutralisation" of the acid, by adding to it a carbonate of any alkali, takes place, when, without an excess of the carbonate, the acid no longer reddens a piece of litmus paper. The substance in solution thus formed is then a neutral salt. You had better sow as soon as possible after steeping the seed; if dried at all, as it will need to be if you drill the seed, it must be by the simple action of sun and air, but it can be hoed in though wet. Our land will not be ready for some time, and as the Wheat will be sown in spring, we shall hoe one bushel in on half an acre of ground. Had it been done in autumn, 1½ bushels per acre would have been plenty. We shall adopt your suggestion about the mineral constituents of plants.

Subsoiling.—*A. W.*—You were right in subsoiling light gravelly Turnip land; you will probably be benefited by it, in the greater depth of active soil you will thus ultimately obtain, and in the greater independence of dry weather which you have thus obtained for plants growing on it. Guano will likely suit your land, and perhaps your best way will be to sow 2 cwt. of it per acre over the growing Wheat, just before you hoe it in spring; but on a light soil you ought to make enough manure on your own farm, without going elsewhere for it. Bog-earth will act both chemically and mechanically in retaining the volatile ingredients of your manure. The addition of salt will not impair this action, and it may perhaps be useful on its own account, letting alone its efficiency as a fixer of ammonia. For answer about the steeping of seeds, see above on that subject.

Sulphuric Acid.—Bones.—*White.*—We informed an anonymous correspondent last week that sulphuric acid costs from 1½*d.* to 2*d.* per lb. We have since been informed that it may be obtained in any quantity from Gibbs' Chemical Works, Bristol, at 1*d.* per lb. To any weight of bone-dust add three-fourths that weight of sulphuric acid diluted with its weight of water; let the two act on one another for a day, and then mix it all up together with a lot of dry earth, and apply at the rate of about four bushels of the bone-dust per acre. A simple way of estimating the proportion in which the chief elements of the soil stand to one another is to be found in Mr. Rham's paper on the subject, in the English Agricultural Society's Journal, from which we extract the following:—"Take a glass tube 2 of an inch in internal diameter, and 3 feet long; fit a cork into one end, and set it upright; fill it half full of pure water; take nearly as much water as has been poured into the tube, and mix with it the portion of soil which is to be examined, in quantity not more than will occupy 6 inches of the tube, and let it stand in a corner of a room, or support it upright in any way. In half an hour it may be examined. The earths will have been deposited according to the size and specific gravity of their particles. The portion still suspended in the water may be allowed to settle; and there will appear in the tube layers of sand, clay, and humus, which may be measured by a scale, and thus their proportions nearly ascertained." Manures cannot be analysed in this simple manner, but means will shortly be published for detecting adulterations in many of them.

Taste of Turnips in Butter.—*A Ross-shire Lady.*—See a paragraph on this subject in our Home Correspondence. If saltpetre will not effect the desired object—many say that it will—there is no remedy but altering the food given to the cows. Mangold Wurtzel will not affect the taste of the butter.

Weeds.—*S. E.*—We are not aware of any publication on this subject by Dr. Daubeny or Professor Henslow. A series of articles on the Weeds of Agriculture will shortly appear in our columns. Try sowing 1 cwt. of salt per acre over your Grass land. The constituents of guano vary much in quantity in different specimens. The first analysis of it was by Klaproth. He found it to consist of—

Urate of ammonia	16 per cent.
Phosphate of lime	10
Oxalate of lime	12.75
Silica	4
Common salt	0. 5
Sand	28
Water and combustible matter	28.75
	100

"The word 'guano' is Peruvian, meaning dung. It is pronounced *Huanu* by the Peruvians, which the Spaniards, according to the genius of their language, spell 'guano.'" You had better make a compost with the gas-water, as already described in this Paper. The refuse bark of the tan-yard will do very well to soak with it.

Weight of Crops.—*M.*—Twenty tons of Swedish Turnips and ten tons of Potatoes may be considered good average crops in any of the best counties in England. We have known of 30 tons of the former and 18 tons of the latter produced per acre under field-culture.

Miscellaneous.—*Bridport.*—The volume for 1843 may be had, price 29*s.*, in boards.

*** As usual, many communications have been received too late for answering this week.

Markets.

SMITHFIELD, Monday, Feb. 5.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s* 10 to 4*s* 2	Best Downs & Half-breds	4*s* 0 to 4*s* 6
Best Short Horns	3 6 3 10	Best Long-wools	4 0 4 2
Second quality Beasts	3 0 3 4	Ewes and second quality	3 6 3 8
Calves	4 6 5 4	Pigs	3 8 4 4

On the whole, our trade to-day has an improved aspect; there is, however, much disappointment in the Beast market, the moderate supply leading us to expect an advance in price, which could not be generally realised. Our best qualities found ready purchasers at perhaps a shade beyond last week's statement, but nothing quotable; the Short-horns and second qualities were a heavy trade at former rates. Calves remain steady. Small Porkers of good quality are a little better sale.

Numbers.—Beasts, 2705; Sheep, 24,400; Calves, 65; Pigs, 260.

Friday, Feb. 9.

There is but little variation to-day from our Monday's report. The supply is short, and everything finds a cheerful trade at about the same rates, with the exception of Veal. The late high prices of this article have had the effect of increasing the supply, and also of decreasing the consumption; these circumstances have caused a slack demand and reduction in price, the very best Calves not making any more than 5*s.* per 8 lbs, and many of good useful quality are sold at considerably less money. Monday and to-day we have noticed several shorn Sheep, but as the present prices of Mutton are mainly attributable to the advance in wool, they are a heavy trade. The weather is much too cold for shorn Sheep.

Numbers.—Beasts, 638; Sheep, 2600; Calves, 164; Pigs, 280.

41, West Smithfield

POTATOES.—Southwark Waterside, Feb. 5.

The supply during the past week has been moderate, but fully equal to the demand. The first two days having been extraordinarily fine caused a great depression in our market, and several remnants of cargoes that have been some time in the market went off heavily, and the annexed prices were barely maintained. The last four days have been frosty, attended with snow, but the change of weather has not at present increased the demand, the tendency having been rather downwards than otherwise; but a continuance of cold weather must check vegetation, and would, consequently, increase the demand for Potatoes.

Kingsford and Lay.

WOOL.—British, Friday, Feb. 9.

Our English Wool Market continues steady. There is evidently a disposition on the part of our large consumers to abstain from buying, for the present, unless they can do so at the present rates. Our Colonial Wool Sales closed on Wednesday evening at advanced rates on the preceding sales.

Farms Current.

	per lb.		per lb.

James Perrin, Wool Broker.

MARK LANE, Friday, February 9.—We have been shortly supplied with English Wheat during the week, and the few samples at market this morning obtained the extreme rates of Monday. Free Foreign is held at rather more money, but scarcely any business has been transacted in it. There continue to be buyers of Bonded Wheat, floating cargoes, and for shipment, at the full prices hitherto paid.—In Barley, Beans, and Peas we observe no alteration.—Oats are a very slow sale, and the turn cheaper.

Kingsford and Lay.

COVENT GARDEN, Feb. 9.—Notwithstanding the extremely changeable state of the weather during the week, the market has been, generally speaking, well supplied; but trade still continues dull. There is a slight alteration in the price of Pine-Apples, which consist principally of Queens and Black Jamaicas. Grapes are offered at nearly the same prices as last week. Good dessert Pears still continue scarce; but Apples are sufficient for the demand; they have rather advanced in price since our last report. A good many foreign ones have appeared in the market during the week. Oranges are good and plentiful; they have diminished a little in price, being offered at from 6*d.* to 1*s.* 6*d.* per dozen. Lemons are plentiful, and are also a little reduced in price since our last report. Chesnuts are selling at from 3*s.* to 8*s.* per peck. The severe frosts have been rather unfavourable to the more tender kinds of vegetable. Broccoli, however, is sufficient for the demand. French Beans are slightly advanced in price; they are offered at from 3*s* to 4*s.* 6*d.* per 100. Cabbages and Brussels Sprouts are abundant; Greens bring from 3*s.* to 4*s.* 6*d.* per dozen. Celery has a little advanced in price, as has also Endive; the latter is offered at from 1*s.* to 2*s.* 6*d.* per score. Seakale is good in quality, but is rather scarce. Asparagus is sufficient to meet the demand. Lettuces are selling at nearly the same prices as last week. A few good Cucumbers have been brought to the market during the week; they are offered at from 6*s.* to 9*s.* each. Cut flowers chiefly consist of Erica transparens and arborea, Euphorbia jacquiniflora, Lachenalia tricolor, Bignonia venusta, Æschinanthus grandiflorus, Cypripedium venustum, Acacias, Azaleas, Rhododendrons, Camellias, Tulips, Pelargoniums, Cinerarias, Primulas, and Roses.

FRUITS.

Pine Apple, per lb., 8*s* to 12*s*	Almonds, per peck, 6*s*

Radish, spring, p. doz. bunches, 1*s* to 2*s*	Chervil, per punnet, 2*d* to 3*d*
Carrots, p. doz. bun., 2*s* 6*d* to 5*s*	Salsafy, per bundle, 1*s* to 1*s* 6*d*
Spinach, per sieve, 1*s* 6*d* to 2*s*	Scorzonera, per bundle, 1*s* 6*d*
Leeks, per doz. bun., 2*d* to 1*s*	

HOPS, Friday, Feb. 9.

The Hop Market for some days past has been more quiet, but prices remain firm, as holders feel satisfied that, with the unusual small stock on hand, the least speculative demand or unfavourable symptom in coming crops would cause a very considerable advance on the present currency.

Mark Fothergill.

CAMBERWELL.—CAMDEN NURSERY GROUNDS.

MESSRS. ELLIS AND SON will SELL by AUCTION, on the above Premises, near Camden Chapel, Peckham-road, on Tuesday, the 13th of February, and following day at 11, on account of the number of lots, under distress for rent, the entire STOCK, Buildings, and Tools; consisting of two capital Greenhouses, 26 feet in length, heated by hot-water-pipes, Forcing pits, Cucumber and hand-lights, Shop fixtures, a case of 150 drawers labelled for seeds, and sundry tools The stock includes an extensive assortment of standard and wall-fruit trees, a great variety of well-selected Roses, Geraniums, and Greenhouse plants, Picotees, Auriculas, Dahlias, Jessamins, Myrtles, Camellias, American plants, Shrubs, and Evergreens, some good specimens of Ornamental trees, and fine Mulberries, a number of Gooseberry and Currant trees, various seeds, &c. To be viewed three days prior to the sale. Catalogues may be had on the premises; at the Horns, Kennington; of Messrs. Fairbairn, nurserymen, Clapham Rise; of Messrs. Forrest and Co. nurserymen, Kensington-road; and of Messrs. ELLIS and SON, auctioneers, 36, Fenchurch-street.

TO BE SOLD, about 2000 clean, robust, well-grown Succession QUEEN PINE PLANTS, from 2s. 6d., 3s 6d., to 5s. per plant; those at 5s. will fruit this autumn, delivered free in London. Gentlemen in want of such will find this an advantageous opportunity of supplying themselves. Application to be sent to Mr. KERNAN, Seedsman, 4, Great Russell-street, Covent-garden, or by card, at the Growers', Forest-hill, London.

NATURAL GRASSES, Separate or mixed.—Poa trivialis, P. pratensis, P. nemoralis, P. fertilis, P. angustifolia, Festuca pratensis, F. duriuscula, F. ovina, F. rubra, F. elatior fertilis, F. gigantea, F. loliacea, Agrostis stolonifera, A. palustris, Dactylis glomerata, Cynosurus cristatus, Alopecurus pratensis, Anthoxanthum odoratum, Avena flavescens, A. pratensis, A. pubescens, Phleum pratense, Lolium perenne, L. perenne Russellianum.

The above, together with Perennial Clovers and other ARTIFICIAL and NATURAL GRASSES, may be had separate by name, or will be supplied in mixtures of such sorts, and in such proportions, as to suit the soil and situation for which they may be required. The cost of the seeds, this season, is from 30s. to 34s. per acre.

Messrs. SUTTON and SONS have for many years supplied Noblemen and Gentlemen with GRASS SEEDS for laying down permanent Pastures and mending old ones, and have the privilege of referring to estates in many parts of England, where the Proprietors have expressed themselves desirous of recommending Messrs. SUTTON'S Seeds.

The FINEST SORTS for LAWNS, mixed. Warranted free from Weeds, 4s. per Gal.; 30s. per Bush.—Reading Nursery, Berkshire.

MIXED GRASS SEEDS, FOR PERMANENT PASTURE AND LAWNS.

ROGER SMITHE, of Eastling, Faversham, Kent, has for Sale the above Seed at 8s. per bushel, three bushels per acre, containing all the best sorts, with a good proportion of the Clovers and Trefoils properly mixed for the generality of land. Persons are requested to name the soil, as the mixture will be regulated by that. Also all other Seeds proportionably low. These will be sent to any part of the Kingdom.

GARDEN VEGETABLE SEEDS.—A Selection of the best and most-approved kinds, in secure packages, for 40s., 20s., and 10s. each; sent carriage free to any part. Parties are at liberty to name distinctly what sorts they require.—Direct to J. and H. BROWN, Albion Nursery, Stoke Newington, London. A post-office order or reference is required. Superior Melon and Cucumber Seeds, 1s. 6d. per packet.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, at present erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery. They beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melons, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had detailing the prices, &c.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, Gloucester place, King's-road, Chelsea.

GUANO ON SALE BY THE IMPORTERS,
JOHN BOYD & Co.,
Wellington Chambers, London Bridge, Borough.

GENUINE PERUVIAN & BOLIVIAN GUANO
ON SALE, BY THE IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL.
47, Lime-st., Jan. 31, 1844.

MANURE FOR GRASS, &c.—POTTER'S GUANO.
Testimonial of Lord Zetland, Dec 2, 1843.

POTTER'S GUANO, 2 cwt. per acre, yielded of *Hay*	2 tons 8 cwt.	
Peruvian Guano, 2 cwt. per acre, yielded of *Hay*	1 „	18 „
Difference in favour of Potter's Guano		10 cwt.

BEAUTIFUL FLOWERS. — POTTER'S CONCENTRATED LIQUID GUANO, in quart bottles, 1s. 9d. each, at the principal Chemists and Seedsmen in town and country.

"I used POTTER'S GUANO on my Pansies; they were *much larger* than I ever had them before, and remained in full blow longer than I ever recollect. JOHN RITSON, Sunderland."

"POTTER'S GUANO will convert your desert into a paradise."—Professor LINDLEY, in *Gardeners' Chronicle*, 1843, p. 560.

Works, 28, Upper Fore-street, Lambeth.

For further testimonials see this Paper of the 6th Jan., 1844.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt.

Phosphate of	Potash	18s. per cwt.
„	Soda	12s. „
„	Magnesia	9s. „
„	Ammonia	1s. per lb.

THE URATE of the LONDON MANURE COMPANY, 5l. per Ton. It is with the greatest satisfaction after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3ft. 3in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents.—Messrs BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

NETTING, BUNTING, and SCRIMS, for EFFECTUALLY PRESERVING the BLOSSOM of FRUIT-TREES from FROST, in convenient quantities and at small cost, at BENJAMIN EDGINGTON'S Marquee and Rick Cloth Manufactory, No. 2, Duke-street, Southwark; and 209, Piccadilly, London.

"We understand from some of our friendly horticultural acquaintance, that wherever Bunting Screens have been employed, the wall-fruit has set in the finest manner, hence we again recommend this fabric in preference to any other."—*Bell's New Weekly Messenger.*

N.B. Some of the canvas used at the Smithfield Club Cattle Show to be sold as second hand, at moderate price, suitable for Rick Cloths, &c.

HEATH-SOIL.—Numerous Gentlemen, visitors at Bournemouth, having applied to R. WHITE & Co. for supplies of the Fine Heath Peat Soil which abounds in that locality, they beg to inform them that they have now made arrangements to be allowed to remove the same, and can consequently offer it and the White Sand at 10s. 6d. per sugar hogshead delivered free on board a coaster at yessel here.

Poole Nursery, Feb. 10, 1844.

Just ready, price 1s.

PRACTICAL HINTS to Practical Men, on NEW and OLD MANURES, by JOHN DODDRIDGE HUMPHREYS, Esq., author of the Electro-Physiology of Man, &c., &c. Full information is here given as to the advantages of the New Manure called HUMPHREY'S FARMER'S COMPOUND, which is not subject like the Guano to be washed out of the soil, but unites the progressive action of the natural with the highest fertilizing powers of the best chemical agents. Wholesale Agents, DAVY, MACMURDO, and Co., 100, Upper Thames-street, London.

LONGMAN, BROWN, GREEN, and LONGMANS.

SCREENS for PROTECTING TREES in Blossom and Fruit from injuries by Wasps and Flies, and for shading Hothouses and Conservatories, Pines and Melons, Tulip-beds, &c., &c.

N. HULME, Paradise-Green, Knutsford, Cheshire, manufactures the following Articles:—Canvas Netting, of three different textures, at 5d.; of a stronger Quality, at 7d.; and of Yarn doubled, at 8d. per square yard. Woollen Netting of different sorts, at 5d., 7d, and 10d. per square yard The above articles are made from one to four yards in width, as may suit the purchasers.—N. H. has for many years had the honour to supply the Nobility, Gentry, and others, in various parts of the Kingdom with the above articles, and has had the happiness to give general satisfaction.

N.B.—Patterns, with the prices annexed, sent (if desired), to any persons wishing to become purchasers. In case of Orders to the amount of five pounds or upwards, carriage by canal or railway will be paid to London, or any place not more distant.

MARDER'S GRAFTING COMPOSITION.—From the expansive and adhesive properties of this Paste, it neither retards the progress of the swelling, nor admits the air, moisture, or frost in the process of healing the Graft, thereby insuring a remedy against failures so prevalent from the adoption of the present imperfect, dirty, and troublesome mode. Sample pots, with directions, at 1s. 6d. and 2s. 6d, sufficient for 100 and 200 Grafts, may be had of the wholesale Agent, Mr. RIPLEY, Hooker's-court, Nicholas-lane, London; VEITCH & SON, Exeter, and of the Proprietor, Lyme Regis. SIX small or four large pots will be forwarded to any part of the Kingdom free of carriage, on receipt of a Post-office order to Mr. RIPLEY, or to the Proprietor.

PROFITABLE MANUFACTURE FOR LANDS, &c.

THE PATENTEE of a Clean and Excellent PREPARATION for Fields and Garden Crops, is ready to grant LICENCES, and to supply Skilful Workmen; also ample Instructions for Manufacture and Use. Seedsmen and others connected with Farmers may thus realise a good Income from small Capital, without risk; Landlords could soon make their lands fertile.

TERMS.—A Premium of Two to Three Hundred Pounds, according to the extent of district exclusively secured. Undoubted reference will be given.

Address, post-paid, To Chymists—care of Mr. ARNOLD, 12, Curzon-street, May-fair, London.

GRAINS TO LET.—Three Nails of Grains per week to Let, about 12 quarters each Nail. Hay, Straw, Corn, &c., would be taken in exchange.—Apply to Messrs. STAUNTON'S, No. 9, Strand.

CUCUMBER and MELON BOXES and LIGHTS.—For Sale, one, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two-light Boxes and Lights complete from 1l. 8s. Garden Lights made, glazed, and painted, from 1s. per foot. Sashes and Frames made, glazed, and hung complete, 1s. 8d. per foot.—At JAMES WATTS, Sash Manufactory, 8, Claremont-place, Old Kent-road.

*** References given.

On January the 8th, 1844, will be published, handsomely printed in Demy 8vo., Part the First, Price 12s.,

SPECIES FILICUM; OR A SYNOPSIS OF ALL KNOWN FERNS. This first Part contains GLEICHENIACEÆ, POLYPODIACEÆ in part, and PLATES i. to XX. By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., F.R.S., &c., &c., Vice President of the Linnean Society, and Director of the Royal Botanic Garden at Kew.

*** It is intended to publish Part the Second on the 1st March, 1844.

London: WILLIAM PAMPLIN, 45, Frith-street, Soho-square.

CURTIS'S BOTANICAL MAGAZINE.—Just published, price 3s. 6d. coloured, No. 206 of the NEW SERIES of this interesting and scientific work, edited by Sir William Jackson Hooker. London: LONGMAN, BROWN, GREEN, and LONGMANS.

BOOKS RECENTLY PUBLISHED, OR IN PROGRESS OF PUBLICATION.

ENCYCLOPÆDIA BRITANNICA; Seventh Edition. Edited by Professor NAPIER. Now completed in 21 Volumes 4to; illustrated by 506 Engravings on Steel, and many Thousands on Wood.

In Paper, Printing, and Embellishment, as well as in the Literary Value of its contents, the Work is accommodated to the improved taste and advanced information of the times; and, whether for the purpose of systematic study or occasional reference, the Proprietors are satisfied that the Seventh Edition of the ENCYCLOPÆDIA BRITANNICA will be found to be the most valuable addition which can be made to a modern library.

A recent writer in the QUARTERLY REVIEW, in adverting to the pre-eminent value of this Encyclopædia, observes, that, "*An Australian or New Zealand settler, who left his home with no other accomplishment but that of being able to read, write, and count, might, with such a companion, beguile his long and weary voyage, and become a well-informed man before he reached his destination.*"

Lord BROUGHAM also, in his recent speech on the Copyright Bill, observed, "*If any work was not only valuable and useful, but absolutely necessary for the country, it was this.*"

An Index of 68,000 references, compiled with great industry and judgment, is appended to the work; forming a ready key to its multifarious contents.

TRAVELS through the ALPS of SAVOY, and OTHER PARTS of the PENNINE CHAIN; with Observations on the Phenomena of Glaciers. By JAMES D. FORBES, F.R.S., Sec. R.S.E.; Corresponding Member of the Royal Institute of France, and Professor of Natural Philosophy in the University of Edinburgh. In a handsome volume, imperial 8vo. Illustrated by a large Map of the Mer de Glace of Chamouni, Lithographed Views and Plans, and Engravings on Wood, price 28*s.*; or, with the large Map, coloured, in a case, 31*s.* 6*d.*

"A volume full of interesting and novel scientific information, pleasant and readable."—*Athenæum.*

A VOYAGE ROUND the COASTS of SCOTLAND and the ISLES. By JAMES WILSON, F.R.S.E., M.W.S., &c. With a Map of Scotland, exhibiting the Tract of the Voyage; a Chart of St. Kilda; 20 Etchings on Steel, by Charles H. Wilson, A.R.S.A., from Sketches during the Voyage by Sir Thomas Dick Lauder, Bart., and numerous Wood Engravings from the same Sketches, drawn by Montague Stanley, Prior, and Sargent, and Engraved by Branston, Landells, and other Artists. 2 vols. post 8vo. Price 21*s.*

"Two of the most charming volumes we have had under our notice for a long time.—They describe scenery round which the imagination loves to linger, and of which no description can be fatiguing."—*Court Journal.*

"Written in a flowing and animated style. * * * Those who wish to know Scotland in its coasts and islands will derive from this work both instruction and pleasure; those who desire to know the value of their country and its institutions, as shown even in the most inaccessible parts of its remotest provinces, will ponder over its contents; and the general reader, who seeks only for that rational amusement which the personal narrative of a lively and intelligent tourist never fails to yield, will find it in these volumes."—*Edinburgh Review.*

BLACK'S GENERAL ATLAS OF THE WORLD. New Edition. To be completed in Eight Parts, (Price 6*s.* each,) of which Seven are now Published.

This Atlas, which is already favourably known by the large circulation of the former Edition, is unsurpassed either in accuracy or beauty of execution by any work of its class, while in cheapness it is altogether unequalled. It contains 61 Folio Maps, engraved on Steel in the first style of Art, by SIDNEY HALL, HUGHES, and others, with Geographical Descriptions, Statistical Tables, and *an Index of all the names occurring in the several Maps, amounting to nearly* 60,000, with their Latitude and Longitude, and the Number of the Map in which they will be found.

The present Edition has been revised and corrected throughout, and many important New Maps have been added to it. Part VII.—which alone is required to complete the work—will contain the General Index, and will appear early in March. Part VIII., containing the New Maps, is Just Published, and is recommended to the purchasers of the former Edition.

"We may now say, with certainty, that as no Atlas exceeds Black's in the neatness of its form and the utility of its dimensions, so, in Geographical accuracy, and beauty of execution, it equals any work extant of similar pretensions, and yet greater charge. We have not been disappointed in a single reference to any of the Maps yet issued, and we have severely tested those of the present Number."—*Atlas.*

A DICTIONARY OF MEDICINE FOR POPULAR USE; containing an Account of Diseases and their Treatment, including those most frequent in warm climates; with Directions for Administering Medicines; the Regulation of Diet and Regimen; and the Management of the Diseases of Women and Children. By ALEXANDER MACAULAY, M.D., Fellow of the Royal College of Surgeons of Edinburgh, and Physician-Accoucheur to the New Town Dispensary. *Eighth Edition.* 1 vol. 8vo. double columns. 14*s.*

"Just such a Work as every head of a family ought to have on his book-shelf."—*Brighton Herald.*

"If sterling merit be the passport to success, this work will obtain the most extensive celebrity."—*Bath Herald.*

"Calculated to accomplish all that could be wished in a popular system of medicine."—*Edinburgh Medical and Surgical Journal.*

"We have seen nothing of the kind better adapted for consultation."—*Literary Gazette.*

"Decidedly the most useful book of the kind that has yet been offered to the public."—*Caledonian Mercury.*

ANGLO-CATHOLICISM NOT APOSTOLICAL; being an Inquiry into the Scriptural Authority of the Leading doctrines advocated in "The Tracts for the Times," and other Publications of the Anglo-Catholic School. By W. LINDSAY ALEXANDER, M.A., Author of "The Connexion and Harmony of the Old and New Testaments," &c. 1 vol. 8vo. Price 8*s.*

"Mr Lindsay Alexander's learned and able work."—*Edinburgh Review.*

"It is written in a calm considerate spirit, and states the arguments of opponents with fairness and candour."—*Athenæum.*

"We most cordially recommend this book. It is not so short as to be superficial, nor so long as to be tedious. It does not bewilder the reader by wandering over the almost interminable range of topics which might be brought into this controversy, but judiciously confines attention to those leading questions which only are of real moment, and which are fundamental to the rest. The style of the work is simple and appropriate, serious as befits the grave subjects it discusses, clear and graceful as that of one accustomed to orderly thinking, and well practised in the communication of his thoughts to others."—*Eclectic Review.*

"He has manifested a most conciliatory and Christian spirit in his management of the argument."—*Church of England Quarterly Review.*

THE FRUIT, FLOWER, and KITCHEN GARDEN. Forming the Article "HORTICULTURE," in the Seventh Edition of the ENCYCLOPÆDIA BRITANNICA. By PATRICK NEILL, LL.D., F.R.S.E., Secretary to the Caledonian Horticultural Society. In post 8vo., illustrated with upwards of Sixty Woodcuts. Price 6*s.*

"One of the best modern books on Gardening extant; clear, comprehensive, and in every part well reasoned."—*Loudon's Gardener's Magazine.*

"No country gentleman who takes an interest in the appearance and successful management of his policies should neglect to furnish a copy of this work to his gardener's library."—*Perthshire Courier.*

"A hand-book of practical instruction in the art superior to any that has hitherto appeared, and which no one with a garden ought to be without."—*Caledonian Mercury.*

"The best book of the kind."—*Nottingham Journal.*

"It includes all the improvements which late experience has introduced."—*Northampton Mercury.*

"A perfect guide in every department of gardening."—*Dundee Courier.*

"The first *really practical* treatise on Horticulture we have seen."—*Somerset County Gazette.*

ADAM AND CHARLES BLACK, EDINBURGH;
LONGMAN and Co.; SIMPKIN, MARSHALL, and Co.; WHITTAKER and Co.; and HAMILTON, ADAMS, and Co., London; and JOHN CUMMING, Dublin.

WORKS
ON AGRICULTURE, LAND-SURVEYING, NATURAL HISTORY, & SCIENCE.
PRINTED FOR
LONGMAN, BROWN, GREEN, & LONGMANS.

AN ENCYCLOPÆDIA of AGRICULTURE; comprising its History in all Countries, the Principles on which Agricultural Operations depend, and their Application to Great Britain and similar Climates. By J. C. LOUDON, F.L.S. Third Edition, 8vo, nearly 1,300 Woodcuts, 2*l.* 10*s.*

THE FARMER'S ENCYCLOPÆDIA, and DICTIONARY of RURAL AFFAIRS; embracing all the recent Discoveries in Agricultural Chemistry; adapted to the comprehension of unscientific readers. By CUTHBERT W. JOHNSON, Esq., F.R.S. 8vo, Woodcuts of the best and most improved Agricultural Implements, 2*l.* 10*s.*

ELEMENTS of PRACTICAL AGRICULTURE. By DAVID LOW, Esq., F.R.S.E., Prof. of Agriculture in the University of Edinburgh. Fourth Edition, greatly improved. 8vo, 200 woodcuts, 21*s.*

The BREEDS of the BRITISH DOMESTICATED ANIMALS DELINEATED and DESCRIBED. By DAVID LOW, Esq., F.R.S.E., Prof. of Agriculture in the University of Edinburgh. 2 vols. 4to, with 56 coloured plates, 16*l.* 16*s.*

AN INQUIRY into the NATURE of the SIMPLE BODIES OF CHEMISTRY. By DAVID LOW, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh. 8vo, 6*s.*

THE APPLICATION of GEOLOGY to AGRICULTURE, and to the Improvement and Valuation of Land: with the Nature and Properties of Soils, and the Principles of Cultivation. By N. WHITLEY, Land Surveyor. 8vo, 7*s.* 6*d.*

THE ART of VALUING RENTS and TILLAGES, And the Tenant's Right of Entering and Quitting Farms, explained by several Specimens of Valuations; and Remarks on the Cultivation pursued on Soils in different Situations. Adapted to the Use of Landlords, Land-Agents, Appraisers, Farmers, and Tenants. By J. S. BAYLDON. 5th Edition, re-written and Enlarged, by JOHN DONALDSON. With a Chapter on the Tithe-Commutation Rent-Charge, by a Gentlemen of much experience on the Tithe Commission. 8vo, 10*s.* 6*d.*

SIR HUMPHRY DAVY'S AGRICULTURAL CHEMISTRY. With Notes by DR. JOHN DAVY. 6th Edition, 8vo, 10 Plates, 15*s.*

CROCKER'S ELEMENTS of LAND-SURVEYING. Fifth Edition, corrected throughout, and considerably improved and modernised, by T. G. BUNT, Land Surveyor, Bristol. To which are added, TABLES OF SIX-FIGURE LOGARITHMS, &c., superintended by RICHARD FARLEY, of the Nautical Almanac Establishment. Post 8vo, 12*s.*

A COMPLETE TREATISE on PRACTICAL LAND SURVEYING. By A. NESBIT. 7th Edition, enlarged. 8vo, Woodcuts, Copper plates, and Field-Book, 12*s.*

A TREATISE on PRACTICAL MENSURATION: containing the most approved Methods of Drawing Geometrical Figures; Mensuration of Superficies; Land Surveying; Mensuration of Solids; the use of the Carpenter's Rule; Timber Measure, &c. &c. By A. NESBIT. 11th Edition, 12mo, Wood-cuts, Copper-plates, and Field-Book. 6*s.* KEY, 5*s.*

ILLUSTRATIONS of the PRINCIPLES and PRACTICE of WARMING and VENTILATING; with Preliminary Remarks on Health and Length of Life. By D. B. REID, M.D., F.R.S.E. 8vo, numerous Woodcuts. [*Just ready.*

RESEARCHES on LIGHT; an Examination of all the Phenomena connected with the Chemical and Molecular Changes produced by the influence of the Solar Rays; embracing all the known Photographic Processes and recent discoveries, with a Discussion on the presumed existence of a new Imponderable Element. By ROBERT HUNT, Secretary of the Royal Cornwall Polytechnic Society. [*In the press.*

A MANUAL of ELECTRICITY, MAGNETISM, and METEOROLOGY. By DIONYSIUS LARDNER, D.C.L., F.R.S. and C. V. WALKER, Esq., Secretary of the Electrical Society. (2 vols.) Vol. II., fcap. 8vo. Vignette title, 6*s.*

LESSONS on CHEMISTRY; for the Use of Pupils in Schools, Junior Students in Universities, and Readers who wish to learn the fundamental principles and leading facts. By WILLIAM H. BALMAIN. Fcap. 8vo, numerous Woodcuts, illustrative of the Decompositions. 6*s.*

A TREATISE on FOOD and DIET: with Observations on the Dietetical Regimen suited for Disordered States of the Digestive Organs. By JON. PEREIRA, M.D., F.R.S., & L.S. 8vo, 16*s.*

DR. TURTON'S MANUAL of the LAND and FRESH-WATER SHELLS of the BRITISH ISLANDS. A New Edition, thoroughly revised, and with considerable Additions. By JOHN EDWARD GRAY, Keeper of the Zoological Collection in the British Museum. Post 8vo, Woodcuts and coloured Plates, 15*s.*

POPULAR CONCHOLOGY; or, the Shell Cabinet arranged: being an Introduction to the Modern System of Conchology; with a sketch of the Natural History of the Animals, an Account of the Formation of the Shells, and a complete Descriptive List of the Families and Genera. By AGNES CATLOW. Fcap. 8vo, 312 Woodcuts, 10*s.* 6*d.*

ELEMENTS of NATURAL HISTORY, for the Use of Schools and Young Persons; comprising the Principles of Classification, interspersed with amusing and instructive original accounts of the most remarkable Animals. By Mrs. R. LEE (formerly Mrs. T. E. BOWDICH), Author of "Taxidermy," "Memoirs of Cuvier," &c. 12mo, Woodcuts. [*Just ready.*

TAXIDERMY; or, the Art of Collecting, Preparing, and Mounting Objects of Natural History: for the Use of Museums and Travellers. By Mrs. R. LEE (formerly Mrs. T. E. BOWDICH), Author of "Memoirs of Cuvier," &c. Sixth Edition, improved, with an Account of a Visit to Walton Hall, and Mr. Waterton's method of Preserving Animals. Fcap. 8vo. Wood Engravings, 7*s.*

LONDON: LONGMAN, BROWN, GREEN, & LONGMANS.

Principles of Language exemplified, by G. Crane
&c.

ORIGINAL PAPERS.—THE CROTON AQUEDUCT, by Mr. P. Hastie, Resident Engineer.

"OUR WEEKLY GOSSIP."—The Natural History Collection made by the Officers of the Erebus and Terror—The working Model of the Nelson Statue—Mr. Westmacott's Sculptures for the Royal Exchange—The Fountains in Trafalgar-square—Mr. Buckingham on the Book Collection for the Institute—Death of Nodier; with Foreign Musical Gossip, &c.

REPORTS OF THE LEARNED SOCIETIES.—ROYAL INSTITUTION (Professor Brande on Fermentation).—SOCIETY OF ARTS (Mr. Ross on the Hygro-barometer—Mr. Heaton on the Rocking of Railway Carriages).

FINE ARTS.—THE NEW CONSERVATIVE CLUB HOUSE, St. James's Street.

MUSIC.—CONTEMPORARY MUSICAL COMPOSERS—Donizetti. Theatres, &c.

MISCELLANEA.—Paris Academy of Sciences (the award of Medical Prizes)—History of Molière Monument, by Aimé Martin—Clockwork—Non-variation of the Compass, &c. &c.

Order of any Newsvender or Bookseller.

MILTON'S BEE HIVES, &c.—A sheet of Illustrations, price 1*s.*, of the various Bee Hives, Feeding Machines, and other apparatus connected with the Apiary, being all the Plates of the "Practical Bee Keeper," a new work on Bees, published by J. W. PARKER, West Strand, and may be had of all Booksellers. The sheet of Illustrations will be sent post free on inclosing 1*s.* and a stamp—all letters pre-paid—to J. MILTON, 10, Great Marylebone-street, Wimpole-street.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-boxes, Edgings for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener, (Sundays excepted).

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

ARGUS LIFE ASSURANCE COMPANY, 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.

Thomas Farncomb, Esq., Alderman, *Chairman.*
William Leaf, Esq., *Deputy-Chairman.*

William Banbury, Esq.
Edward Bates, Esq.
Thomas Camplin, Esq.
James Clift, Esq.
Rt. Hon. J. Humphery, M.P., late Lord Mayor of London.
Rupert Ingleby, Esq.
Thomas Kelly, Esq., Alderman.
Jeremiah Pilcher, Esq., Sheriff of London and Middlesex.
Lewis Pocock, Esq.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.

Low Rates of Premiums.

In addition to the subscribed capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 16 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.

DIRECTORS.

E. Barnard, Esq., F.R.S.
Robert Brooks, Esq.
Henry Buckle, Esq.
John Henry Capper, Esq.
Gideon Colquhoun, Esq.
C. E. Mangles, Esq.
Richard Onslow, Esq.
William Walker, Esq.

BANKERS.—Union Bank of London.

COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN.—Patrick Fraser, Esq., M.D., No. 62, Guildford-st.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.)

Directors.

Chairman.—Robert Currey, Esq.

Edward Baker, Esq.
Jasper Capper, Esq.
Thomas Dakeyne, Esq.
Giles Redmayne, Esq.
James Spicer, Esq.
Henry Sterry, Esq.
Thomas Bax, Esq.
Joseph Cooper, Esq.
Russell Jeffrey, Esq.
William R. Spicer, Esq.
Joseph Sterry, jun., Esq.
Robert Wilcoxon, Esq.

Bankers.

Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*

A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

ROWLAND'S MACASSAR OIL.—Patronised by Her Majesty, H.R.H. Prince Albert, the Royal Family, and the several Courts of Europe.—This elegant, fragrant, and pellucid Oil, in its preservative, restorative, and beautifying qualities, is unequalled over the whole world. It preserves and reproduces the hair, even at a late period of life; prevents it from turning grey; or if so changed, restores it to its original colour; frees it from scurf and impurity, and renders it soft, silky, curly, and glossy, and retains its curl and other decorative form uninjured by the variations of the atmosphere or the effects of the crowded assembly—facts which are abundantly proved by the numerous testimonials which may be seen at the Proprietors'.

Its value is of course enhanced by being used at an early period of life, and to children it is especially recommended as forming the basis of a beautiful head of Hair. Price 3*s.* 6*d.*, 7*s.* Family Bottles, (equal to four small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle.

CAUTION.—Each genuine bottle has the words "ROWLAND'S MACASSAR OIL," engraved in two lines, on the wrapper, and on the back of the wrapper nearly 1500 times, containing 29,028 letters. Be sure to ask for "Rowland's Macassar Oil."

Sold by the Proprietors, A. ROWLAND and SON, 20, Hatton-garden, London, and by Chemists and Perfumers.

*** All others are spurious imitations!!!

DISEASED AND HEALTHY LIVES ASSURED. MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London.—This Office is provided with very accurately-constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families Assured at Equitable Rates.

E. G. P. NELSON, Actuary.

PROTECTION TO AGRICULTURE.

AT a NUMEROUS MEETING (convened by the Tenant Farmers), of the LAND-OWNERS, OCCUPIERS, and OTHER FRIENDS of BRITISH AGRICULTURE, held in the Town Hall, at Wetherby, on Thursday, the 1st day of February, 1844, for the purpose of adopting such Measures as may best resist the present dangerous proceedings of the Anti-Corn-Law League, The EARL of HAREWOOD in the chair, it was moved by Mr. W. HANNAM, seconded by the Hon. EDWIN LASCELLES:—That the National and Local Burthens imposed upon the land render the maintenance of a system of protection absolutely necessary to enable British Agriculture to compete with the untaxed Soils and cheap Labour of Foreign States, and that the Legislative Protection which is now afforded is not more than is equivalent to these burthens, and not more than is afforded to the other productive Arts of the Country.

Moved by G. L. FOX, Esq., seconded by Mr. JOHN RHODES:

2d. It is with regret and indignation that we witness the increasing attempts which are being made throughout the Kingdom by means of false statements, and under pretence of advocating the principles of Free Trade, to delude the Working-Classes, disunite Landlord and Tenant, and to prejudice both against the best interests of the country.

Moved by Mr. TENNANT, seconded by JOSEPH DENT, Esq.:

3d. That the time has now arrived when it is the duty of every one interested in Agriculture, involving as it does the welfare of all classes, strenuously to oppose the pernicious designs of the Anti-Corn-law League.

Moved by the Hon. ARTHUR LASCELLES, seconded by the Rev. B. EAMONSON:

4th. That this Meeting pledges itself to use every exertion for the maintenance of the present protective system, and that a committee, consisting of the following persons, be now formed for this purpose, and for co-operating with any County or Central Committee in upholding the same:—The Earl of Harewood, G. L. Fox, Esq., the Hon. E. Lascelles, J. Dent, Esq., the Hon. A. Lascelles, T. L. Fairfax, Esq., G. L. Fox, jun., Esq., Col. Markham, E. York, Esq., Rev. B. Eamonson, Messrs. Kell, Maughan, Gaunt, Ridsdale, John Rhodes, Coates, W. Hannam, J. Parkin, J. Stevenson, C. Wardman, Q. Rhodes, W. Crosby, Wm. Acomb, J. H. Downes, Tennant, Hardcastle, and Allen.

Moved by Col. MARKHAM, seconded by EDW. YORK, Esq.:

5th. That petitions to both Houses of Parliament, founded on the foregoing resolutions, be prepared by the Committee, and sent for signature to all the Townships within the District of the Wetherby Market.

Moved by THOS. L. FAIRFAX, Esq., seconded by Mr. GAUNT:

6th. That these Resolutions be printed for circulation and advertised in the Newspapers. HAREWOOD, Chairman.

The Earl of Harewood having left the Chair, it was moved by G. LANE FOX, Esq., seconded by C. A. FISCHER, Esq., and carried by acclamation:—That the best thanks of this Meeting be given to the Earl of HAREWOOD, for his efficient services in the chair this day.

DURHAM ANTI-LEAGUE MEETING.

AT A MEETING OF FARMERS AND LAND-OWNERS, held at the Rose and Crown Inn, Durham, on Saturday, the 3rd of February, 1844. Mr. JOHN WOOD, of Kimblesworth, in the Chair.

The following Letter from the Duke of Cleveland was read to the Meeting:—

TO THE CHAIRMAN OF THE FARMERS' MEETING,
To be held at the Rose and Crown Inn, Durham, on Saturday, the 3rd of February.

"Raby Castle, January 31, 1844.

"SIR,—I take the liberty of addressing you as the Chairman, in consequence of a printed circular forwarded to me yesterday, calling upon the Farmers of the county of Durham to attend a public meeting, to be held in that city on Saturday next, the 3rd of February, for the purpose of taking into consideration the adoption of means the most efficient to resist the present agitation of the Anti-Corn-Law League. As an individual who have at all times taken a lively interest in the prosperity of Agriculture, and who for a long series of years, in my place in Parliament, have never ceased to advocate that protection so justly due to British industry, I cannot but rejoice to find that the *occupiers* of the *soil* in my native county are the first to take the lead, to bestir themselves, and to follow the example which has been set them already by the principal Agricultural counties throughout the country, to resist the most atrocious attempt at conspiracy ever formed in this country by one body of men to ruin and annihilate the other. I am glad to observe, as I have already stated, that the farmers in this county, as the most interested, are the first to take the lead; but if I may be allowed to offer an opinion, I much fear that without the assistance, the aid, and co-operation of the land-owners, resident gentry, and others, who are well-wishers to the Agricultural interest, little good can be done; and to effect this object, it is desirable that, if not a county meeting called by the Sheriff, yet as large and as respectable a meeting as possible should be assembled, in some situation adequate to hold those who may deem it their duty to attend; for this purpose, however, if it is thought desirable, some length of notice should be given, even if it were for the convenience of your County Members alone, who, I have no doubt, would be anxious to attend, as I believe all of them agree in condemning the proceedings of the Anti-Corn-law conspiracy. Whilst agitation, when unprovoked, is, in my opinion, at all times most reprehensible, yet self-defence, when confined to such, is not merely a virtue, but a sacred duty we owe to ourselves and to those who belong to us. I beg pardon, Sir, for having offered these few hasty remarks, which I beg you will consider in no other light, or take any further notice of, than what in your own judgment, and of that of those who are acting in concert with you, may be deemed worthy of consideration; merely hoping that I may be considered, as I am proud to call myself, a hearty well-wisher in your cause.—I have the honour to be, Sir, your obedient, humble servant,

CLEVELAND."

On the Motion of F. D. JOHNSON, Esq., seconded by R. S. SURTEES, Esq., it was unanimously resolved,—That the cordial thanks of this Meeting be given to the Duke of Cleveland for his continued exertions in the promotion of Agriculture, and for his Letter, addressed to the Chairman of this meeting.

On the Motion of T. D. SHAFTO, Esq., seconded by W. L. WHARTON, Esq.,—That a Committee of Farmers and Land-owners be immediately appointed for taking the recommendation of the Duke of Cleveland into consideration, and calling such General Meeting as they shall deem expedient.

On the Motion of Mr. BOOTH, seconded by Mr. J. CROFTON,—That the Rev. J. Tyson, Mr. J. Wood, Mr. Arrowsmith, Mr. Crofton, Mr. J. Crofton, Mr. Johnson, Mr. Booth, Mr. Sheppard, Mr. Surtees, Mr. P. Forster, Mr. T. D. Shafto, Mr. Davison, and Mr. Wharton, form the proposed Committee, with power to add to their numbers—five to be a quorum.—JOHN WOOD, Chairman.

On the Motion of T. DAVISON, Esq., seconded by Mr. ARROWSMITH,—It was unanimously Resolved that the thanks of the Meeting be given to the Chairman.

HEALTH being paramount to all earthly blessings, mankind are ever anxious to recover it when lost, and retain it when restored. The ENEMA FOUNTAINS, invented by J. READ, have been honoured by the Nobility, and sanctioned by the highest Medical authorities in this kingdom, the continent of Europe, India, and America, as the best and most durable instruments of the kind ever offered to the public. Vide the Life of Sir A. Cooper.—J. READ begs to inform the Public that he has now made such improvements in the above, as to surpass anything of the kind ever offered. They are more simple, portable, and durable, and are now fitted up with tubes that are not liable to be out of repair from change of climate, &c.—Manufactured only by the Patentee, 35, Regent-circus, Piccadilly.

N.B.—None are genuine except stamped with his name.

News of the Week.

BY the Overland Mail from India we have accounts from Bombay to the 1st of January, and from China to the 1st of December. India continues tranquil. The disturbances in Gwalior have been cut short by the occupation of that kingdom by the British army under Sir Hugh Gough, accompanied by the Governor-General in person. The Punjaub is still in a state bordering upon anarchy, and many of the petty chiefs are preparing to declare their independence. In Scinde our troops continue to suffer from the prevailing fever, and out of the powerful army of Sir C. Napier there are only a few hundred men fit for duty. In China the supplementary treaty had been signed by Sir H. Pottinger and the Imperial Commissioner, and promulgated on the 18th November. Canton had been the scene of some destructive fires, by which many of the European factories were consumed. The sickness at Hong-Kong continues to give rise to serious anxiety, and Major Eldred Pottinger, whose gallantry was so conspicuous in the Affghan war, is among the number of its victims.—From France we have detailed accounts of the results of the late contest on the address, as manifested in the defection of several adherents of the Cabinet, and particularly in that of M. Salvandy, the Ambassador at Turin. The subsequent resignation of this diplomatist, who has now openly joined the Opposition, has supplied abundant materials for renewed attacks upon the Cabinet, and a change of Ministry has consequently become the rumour of the day at Paris.—From Spain we learn that another revolution has occurred, having for its object the overthrow of the present Ministry. The movement first appeared at Alicante, and thence spread with extraordinary rapidity to Valencia, Carthagena, and other important towns. The Council of Ministers at Madrid have adopted extreme measures for the suppression of

the revolt, and have even arrested the leaders of the Opposition in the capital, on the pretext that the whole party are concerned in a vast conspiracy, of which the outbreak at Alicante is merely a preliminary symptom. Death has this week been busy among the Royal Families of the Continent; in addition to the Infanta Carlota, the ambitious aunt of the Queen of Spain, our foreign news records the deaths of the Duke of Saxe Coburg Gotha, the father of Prince Albert; the Grand Duchess of Oldenburg, and the Archduchess Maria Carolina of Austria. We have also accounts of the alarming illness of the King of Sweden, one of the oldest Sovereigns of Europe—the nature of whose malady affords but faint hopes of his recovery.

At home, the proceedings in Parliament have been chiefly confined to notices of motion and routine business, if we except the incidental discussions on Ireland and other topics which have arisen in the progress of debate. On Monday, Mr. Gladstone, as President of the Board of Trade, obtained leave to bring in a bill respecting railways, and on Tuesday Sir J. Graham obtained leave to bring in a bill regulating the employment of children in factories. On Thursday Lord Ashley brought forward his motion respecting the Ameers of Scinde, which led to an interesting discussion, but was negatived by a large majority.—Our account of the State trials in Ireland comes down to Thursday night. The case for the defence closed on Tuesday, and on Wednesday the Solicitor-General began his reply on the part of the Crown. The learned gentleman had not concluded on Thursday, and as the summing up will necessarily occupy some time, it is not expected that the Jury will be able to return their verdict until the middle of next week.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Princess Royal, left Buckingham Palace on Saturday afternoon for Windsor Castle. Her Majesty travelled post to Windsor unattended by any escort. The equerries in waiting accompanied her Majesty, but the Lords and Ladies of the suite proceeded to Windsor by the Great Western Railway. Intelligence reached town prior to her Majesty's departure of the death of the Duke of Saxe Coburg, the father of Prince Albert. In consequence of this bereavement her Majesty and the Prince have remained in strict privacy since their return to Windsor, and the Court on Thursday went into deep mourning.

Parliamentary Movements.—The election for Devizes took place on Wednesday, when Mr. Bruges the Conservative candidate was returned by a majority of 142; the numbers were for Mr. Bruges 206, for Mr. Temple the Liberal candidate 64. Mr. Marton, member for Lancaster, has contradicted the rumour that he is about to resign his seat; he states that the report is a mere invention.

Public Income.—A return has just been laid before Parliament of the net public income of the United Kingdom with an account of the balances of money remaining in the Exchequer on the 5th of January 1843 and 1844. The total amount of revenue for the year ending January 5, 1844, derived from direct and indirect taxes, was 51,069,978*l.* 7*s.*, including 5,249,260*l.* 13*s.* 11*d.* on account of the Income-tax, and from other receipts 1,512,839*l.*, making altogether 52,582,817*l.* 10*s.* 2*d.*; of the latter sum the money received from China forms the principal item and amounts to 1,315,209*l.* 1*s.* 6*d.* The total charge of the funded debt is 28,581,076*l.* 4*s.* 2*d.*, for the army 5,997,156*l.*, the navy 6,606,056*l.*, the ordnance 1,910,704*l.*, Canada insurrection 25,300*l.*, China expedition 416,056*l.*, and opium compensation 1,245 823*l.* The excess of income over expenditure is 1,443,302*l.* 18*s.* 8½*d.* The balance in the Exchequer on the 5th Jan. 1843 was 1,390,059*l.*, and at the same period in 1844 it amounted to 4.716.019*l.* 1*s.* 4½*d.*

Death of the Earl of Beusborough.—This venerable nobleman died on Saturday at the seat of his second son, Lord de Mauley, at Canford-house Dorsetshire, where his Lordship had arrived from Brighton and sunk under the prevalent influenza at the advanced age of 86. His Lordship is succeeded in his titles and estates by his eldest son Viscount Duncannon who was called to the House of Lords in 1835.

Foreign.

FRANCE.—The result of the extraordinary debate on the Address, of which we gave a summary in our last, is said to have endangered the stability of the Cabinet. No less than 40 of their ordinary supporters voted against Ministers, and among them was M. de Salvandy, the Ambassador at Turin, who voted against the Government three times in one day. His conduct excited the notice of the King, and when the Ambassador subsequently appeared at Court with the Deputation on the Address, His Majesty approached the spot where M. de Salvandy was standing, and taking hold of the red ribbon of the Legion of Honour recently presented to him, and which M. de Salvandy wore on his breast, he said, in a loud voice, "I did not give you that, sir, in order that you might vote in favour of those whom my Government brands." After this, M. de Salvandy had no alternative but to retire, and the following morning he sent his resignation of the Embassy at Turin to M. Guizot. As might have been apprehended, these proceedings have greatly increased the excitement and irritation produced by the debate on the Address. The resignation of M. de Salvandy is the leading topic of all the Opposition papers, which enlarge upon it with the more vehemence as it would appear to be as animating a theme in every public place and private circle of Paris. M. de Salvandy was but a short time ago much more an object of ridicule than of favour with those who now extol his conduct, and when he left Madrid in consequence of his contention with Espartero he exposed himself to the utmost laughter; and even in the very debate the conclusion of which has yielded him so much admiration, the Ministry were derided for having employed such a diplomatist. He has now become a popular personage, and the treatment he has been subjected to is pronounced another iniquitous attack upon the independence of the representatives of France. Rumours of an impending dissolution of the Chamber or of a change in the Cabinet are mentioned in most of the papers and would appear to be very generally current at Paris. It is not denied in any quarter that M. de Salvandy is a firm adherent of Count Molé—a circumstance which was held to impart consistency to the rumours in circulation for some time that ere long Count Molé would appear at the head of a new Cabinet. It is said however that M. Guizot is determined not to be forced out of office by anything short of an unequivocal vote of the Chambers against him, an event which at the last sitting appeared more remote and unlikely than on any day since the commencement of the session. The *Moniteur* announces that M. de Salvandy has been succeeded in the embassy at Turin by Baron Mortier, who is to be replaced as Minister in Switzerland by Count Pontois the nominal Ambassador at Constantinople. Next to this affair of M. Salvandy, the leading theme of the papers is her Majesty's speech on the opening of Parliament, which with the comments upon it, occupies a large portion of their columns. To the passage referring to her Majesty's friendly relations with the King of the French, and the good understanding happily established between the two Governments their attention is of course directed, and with the exception of the Ministerial papers they all complain that the terms adopted by her Majesty are less cordial and complimentary than they had a right to expect after the strong expressions of the King of the French.—The death of General Bertrand, the friend of Napoleon and his companion in exile, which took place on the 1st inst. at Chateauroux, was communicated to the Chamber on Friday by M. de Briqueville, who suggested that his ashes should be placed along with those of the Emperor, and stated that he would draw up a regular resolution to that effect which he would at the proper time propose to the Chamber. The suggestion was well received by the Chamber and is expected to be adopted.—There was no public sitting of that assembly on Saturday, nor was any to take place until the President convoked the Members—a delay which the *National* accuses him of affording the Ministry in order to enable them to adopt their measures, let their dispersed majority unite again, and suffer time to cool the irritation and resentment which the late debate has kindled. The *Gazette* of Thursday announces that in the morning of that day 500 students of the various schools waited on M. de Chateaubriand and presented to him an address expressive of their admiration and sympathy. Letters from Toulon and Marseilles speak of terrific gales in the Mediterranean, which had retarded the arrival of the Indian mail at Marseilles till Saturday. The Levant mail due on Sunday in Paris had not arrived on Tuesday. Immense quantities of snow had fallen throughout France, and the mails from every quarter were in arrear.

SPAIN.—By extraordinary express from Paris we have accounts from Madrid, which state that a revolution had broken out at Alicante on the 28th Jan. of the most formidable nature. The Provincial Regiment of Valencia stationed in the town joined in the insurrection, which was directed against the Government. The cry of the insurgents was, "Long live the constitutional Queen—down with the Ministers." The military commander and political chief were surprised and arrested by the Custom-house Carabineers. The Council of Ministers at Madrid on receiving this news immediately gave orders for the arrest of the leaders of the Progresista party, and among others of Messrs. Cortina, Lopez, Madoz, Garnica, Ors, and Benedicto, most of whom were taken. It was said that Generals Serrano and Concha had also been put under arrest. The pretexts for these arrests is, that the whole Progresista party have entered into a vast conspiracy, of which the breaking out at Alicante is the first symptom. The *Gazette* is full of the most severe decrees directed against the insurgents. The Minister of the Interior has forbidden the publication of the proclamations of the revolters, under pain of being shot as conspirators. Madrid is placed under martial law, as well as the provinces of Alicante, Murcia, Albacetta, Valencia, Almeira, Castilone de la Plana, which are all placed in a state of siege. Three steam-vessels have been despatched to Alicante to blockade the place, and a large body of troops under Brigadier Cordova have been directed to leave Madrid for the disturbed districts. It was reported that Carthagena had joined in the revolt. The National Guards are to be suppressed, and the liberty of the press abolished.—Intelligence has been received of the death of the Infanta Carlota, consort of Don Francisco de Paula, and sister of the King of Naples, of Queen Christina, the Duchess de Berry, &c., which took place on the 29th ult. at Madrid. This event derives great importance from the prospect it opens of the marriage of the son of this ambitious princess with Queen Isabella, and the consequent settlement of the affairs of Spain. One of the daughters of her Royal Highness is dangerously ill with small-pox. It is said to be the intention of Queen Christina to leave Paris for Madrid in the course of next week; and the preparations for her departure have commenced. The corporation of Madrid has appointed a deputation to receive her Majesty on her return into Spain, which has already set out for the frontiers of France. The last accounts from Saragossa state that the disarming of the National Guard was proceeding, and that peace was re-established. It appears however that out of 6000 National Guard only 600 had given up their arms at the time the latest accounts left. In consequence of General Prim's refusal of the post of Governor of Madrid, General Schelly the political chief of Barcelona has been appointed to that office, and General Pezuela has accepted the Inspector Generalship of Cavalry which was refused by General Serrano.—A royal decree has been published organizing a bank in Madrid with a capital of 100,000,000 reals. "Having taken into consideration," it says, "the reasons exposed to me by the Minister of Finance, and the advice of the Council of Ministers, I have decreed that a discount, loan, and deposit bank be established in Madrid, under the name of the Bank of Isabel II."

PORTUGAL.—The news from Lisbon is confined to the proceedings of the Cortes, which present however no topics of general interest, and to the intrigues of the Opposition for the purpose of overthrowing the present Ministry.—From Madeira we learn that Dr. Kally was liberated from prison at Funchal on New Year's Day, in consequence of the remonstrances made by our Government.

GERMANY.—Advices reached town on Saturday announcing the unexpected death of the Duke of Saxe Coburg and Gotha, uncle and father-in-law of Her Majesty, father of Prince Albert, and eldest brother of the Duchess of Kent and the King of the Belgians. His Royal Highness had just attained his 60th year, and was universally beloved by his subjects. He succeeded his father Duke Francis in the year 1806, but was precluded from taking possession by his adherence to the King of Prussia until 1813. In that year he commanded the 5th Corps d'Armée, and Mentz was delivered up to him by the French. After the Congress of Vienna he bestowed his whole attention to the welfare of his people, and in 1819 gave them of his own accord a representative constitution. After the extinction of the House of Gotha he shared in the division of it with Saxe Meiningen and Saxe Hilburghausen, giving up Saalfeld to the Duke of Saxe Meiningen, and receiving the principality of Gotha, subsequent to which the title of the house was changed into that of Saxe Coburg and Gotha. He was a great lover of the arts and sciences, and his active energy is evinced by the creation of the Palace of Coburg, the restoration of the old Castle, the erection of the chateaux of Rosenau (Prince Albert's birth-place) and Calenberg, and Reinhoodsbrunn, the High School at Gotha, and the two splendid theatres at Coburg and Gotha. He was married to Louisa, only daughter of Augustus Duke of Saxe Gotha and Altenburg, by whom he had issue, Ernest, now the reigning Duke, and Prince Albert, whose education he personally superintended with the utmost solicitude and care. He was married a second time to Antoinetta, daughter of the Duke of Mecklenburg, by whom he has left no issue.—Accounts have been received from Oldenburg, announcing the death of the Grand Duchess Cecilia on the 27th ult. after giving birth to a Prince. The Grand Duchess was the eldest daughter of the late King Gustavus Adolphus IV. of Sweden, was born June 22, 1807, and married to the reigning Grand Duke May the 5th, 1831. From Vienna we learn that the Imperial Family was visited by a severe affliction on the 24th ult., by the sudden death of her Imperial Highness the Archduchess Maria Carolina Augusta, eldest daughter of the Archduke Rainier, Viceroy of Lombardy. Her Imperial Highness was twenty-three years of age. This bereavement is the more melancholy, as the Archduchess was to have been married next month to the Prince of Savoy Carignan. The French papers announce that the Duc de Bordeaux arrived at Goritz on the 21th ult. and had the satisfaction of finding the health of the Duc d'Angoulême so much improved, that he was able to join the family dinner given to celebrate his return. Several obstacles from the snow delayed the Prince's progress, and in passing the Tyrol, one of his carriages was overturned, which obliged him to leave behind two of the persons of his suite.

SWEDEN.—By the Hamburgh mail we have accounts from Stockholm, stating that the King of Sweden who completed his 81st year on the 26th ult. has been attacked with alarming illness. The *State Gazette* publishes the following bulletins:—"Jan. 26, 10 A.M.—The King, who retired to rest yesterday evening without any appearance of indisposition and slept well during the night, was seized at half-past 6 this morning with vomiting and determination of blood to the head, which still continues, but appears however to diminish. 2 P.M.—His Majesty is easier, and seems to be better than when the last bulletin was issued. 5 P.M.—His Majesty has experienced no change since 2 o'clock." The *Aftonblad* adds to the second bulletin that the appearance of improvement was produced by bleeding; that the King had never before consented to be bled, but that the physician having now declared that nothing else could save his life, it has been done by order of the Crown Prince. The vomiting was a spitting of blood. The blood from the arm had no unfavourable appearance, and the patient fell into a state of lethargy. Between 10 and 11 in the forenoon he asked for coffee, and drank some, then vomited again and went to sleep. Between 12 and 1, he drank a glass of water, which he took from the hand of an attendant. Private letters add that very little hope is entertained of his Majesty's recovery.

ITALY.—The official *Gazette* of Naples formally announces the recognition of Queen Isabella II. of Spain by the Court of Naples. A private letter from Forli in the Papal States says that a collision had taken place between the inhabitants of Castel Bolognese and the

volunteers, in which several persons were killed, and a great number wounded. At Ravenna the director of police had been fired at as he was entering his own house. At Ancona considerable excitement existed since the late arrests. The persons arrested have been sent to Bologna where they will be tried by a Military commission. Letters from Rome of the 19th ult. state that the negotiations for settling the differences between the Holy See and the Cabinet of St. Petersburgh do not make any progress. His Royal Highness Prince George of Cambridge, travelling under the *incognito* of Count Culloden, is still there and lives quite retired, his Royal Highness having scarcely honoured by his presence any of the brilliant parties given by the nobility. It had been rumoured that the Camera had determined not to hold any Carnival this year, but a letter of the 20th states that the apprehensions which were entertained of the Carnival being interdicted are dissipated, and that the Governor of Rome, M. Zacchi, has issued a decree allowing it to take place according to ancient custom, but with some stringent regulations in regard to the sale of confectionary, which during the Carnival season is usually made of spurious articles and sold to the public as genuine. The permission obtained for the annual festivities has given much satisfaction to the inhabitants, and to the foreigners who resort to that city to witness the gay scene.

EGYPT.—Advices from Alexandria of the 20th ult. state that his Excellency Boghos Youssouff Bey, Minister of Foreign Affairs and Commerce to Mehemet Ali, died on the 10th ult. at the age of about 71. He had been ill for several days and would not receive his doctor or attend to his prescriptions. His funeral took place on the following day attended by the majority of the European residents at Alexandria and the Consuls. The ceremony was, however, very simple, there being no guard of honour nor any display whatever to denote the high rank of the deceased, and not a single Turk was present although Boghos Bey was considered the highest person in Egypt after Mehemet Ali and his family. He was an Armenian by birth and a native of Smyrna.

INDIA AND CHINA.—The Indian Mail of the 1st Jan. arrived in town on Wednesday. India still continues peaceful. The Punjaub alone seems now to be the only quarter from which we have reason to be apprehensive. It appears that Golab Singh, the elder brother of Dhyan Singh, Runjeet's favourite Minister, who was assassinated in September last, had come from his mountain fastnesses to Lahore, under pretence of supporting his nephew Heera Singh, who now governs there under the name of the young Sovereign Dhuleep, and that his arrival had not produced the expected results. The young Minister is described as giving large sums of money to the common soldiers, in order to retain them in some order, while his uncles are busy in plundering the treasures of the Seikh Government, and carrying away the jewels and articles of value to the mountains. An attempt was made by his own uncle to carry away the young Rajah and place him under the protection of the British, but it was not successful. Care is taken by the present chiefs to occupy the fords across the rivers, so that even the refugees are detained. The state of the country is described as bordering upon anarchy. Many of the petty chiefs are anxious to proclaim their independence, and are ready for an insurrection, which is likely to happen as soon as the actual Minister and his friends have collected the money necessary to gratify their rapacity. Lord Ellenborough left Calcutta on the 25th Nov. and arrived at Agra on the 11th Dec., where the Army of Exercise was ready under the orders of the Commander-in-Chief, Sir Hugh Gough. The first brigade, led by General Valiant, was ordered to move towards Dhoolpoor, half way to Gwalior; it marched on the 12th, and the rest of the army moved in the same direction on the following days. The Commander-in-Chief and the Governor-General set out on the 16th. The intelligence reached Gwalior, and produced alarm, and a council was held on the 15th, at which the principal officers and generals attended, and debated in the presence of the Bahee, or "young Queen," who asked if there were any of them disposed to resist the British! None seeming inclined, a determination was adopted to surrender the cause of all the disorder—the Minister named the Khasgeewalla. This was effected, and the Khasgeewalla was surrendered, and taken prisoner to Agra, where he was lodged in the fort on the 20th. The young Rajah, who was chosen to be heir to the last Sovereign by the Bhaee, took refuge in the camp of the Governor-General, who is now completely master of the whole kingdom, for it has fallen to the East India Company as the lords paramount. From Scinde there is nothing of any moment saving the alarming state to which the troops have been reduced from the effects of fever. The accounts are melancholy in the extreme. Though fever in some portion of it has been on the decline, another scourge, in the shape of dysentery, has unfortunately shown itself, and numbered a great many among its victims. Sukkur, especially, seems to suffer more than any other station. At a muster of the whole Bengal force lately, no more than 135 men were able to appear, while the number of sick amounted to 2,374. The number of deaths were also increasing; nearly 400 of the Bengal portion of the force had been cut off within fifty and sixty days. No more than 340 out of a force of about 3,600 were fit for duty, and 33 officers have been forced to leave from ill health. A great deficiency is still experienced from the want of medical officers, and though numbers have been sent from Madras and other places they are totally inadequate to the amount of duty imposed. General Simpson had returned from his expedition to the Lukhee Hills for the purpose, as was formerly supposed, of chastising numbers of Beloochees who had descended to the plains and committed ravages among the peaceful inhabitants. He had been unsuccessful in his object and had with eleven of his officers been laid up with fever. Sir C. Napier remained at Kurrachee but was expected to move shortly for Hyderabad. At Cabul the power of Dost Mahomed was rapidly on the decline, and both he and his son Akhbar had departed for Jellalabad to silence the refractory chiefs.—The accounts from China are to December 1. Canton had been visited with some destructive conflagrations by which the French, Spanish, and Dutch hongs or factories, with about three thousand houses had been destroyed. The supplementary treaty had been already signed by Sir Henry Pottinger and the Chinese Minister, and was promulgated on the 18th. Some Americans, as if courting a cause of quarrel with the Chinese, had ventured upon excursions into the interior; this practice had produced from the British Plenipotentiary a declaration to the Chinese Commissioner that he should by no means countenance such proceedings, and that orders should be given to the Consuls to have all such foreigners arrested and sent to Hong Kong. The death of Major Eldred Pottinger, the gallant defender of Herat and Cabul, which occurred at Hong Kong, was greatly deplored. Colonel Knowles of the Artillery, and assistant-surgeons Grahame and Dill have also fallen victims to the fever. Rumour spoke of some differences between Sir H. Pottinger and the British Admiral and General. The former was said to be anxious to return to Europe, and the Admiral was about to sail for Calcutta. The American frigate and Minister had gone to China from Bombay and Colombo, at both of which places he had been well received.

UNITED STATES.—There have been several arrivals from New York and Philadelphia this week, but the news received is not of great importance. In Congress, the Oregon question had been the subject of various motions and speeches; but as yet had led to nothing. It appears that the American Government wished to treat in London, which would enable it to protract the negotiations; whereas the British Government preferred negotiating in Washington, and had sent Mr. Pakenham with full powers. The result of these negotiations would probably be awaited before any motion would be allowed to pass.—A bill had been introduced to abolish imprisonment for debt in the district of Columbia, and another to exempt from duty cotton imported into the United States from Texas. The papers contain a long account of another disastrous shipwreck of a steamer running from Cincinnati to St. Louis, by which about 100 persons perished. She struck on a snag or sunken tree, on the night of the 4th ult. when within three miles of St. Louis, and broke into two parts before the passengers could get out of their beds. Among the passengers by these arrivals is Charles Shatton, a celebrity, known as General Tom Thumb, the renowned American dwarf. This wonderful little man is said to have created a greater excitement in the United States than any curiosity exhibited there within half a century; and it is not to be wondered at, for the little general is of fine symmetrical proportions, remarkable intellect, is sociable and manly, and weighs only fifteen pounds. The American papers speak of his performances in the classic statues, songs, dances, &c., as unique beyond description.—The Philadelphia papers state that a chair which has been in Mr. O'Connell's family for 300 years had been received at Washington, as a present from the great agitator to Mr. Robert Tyler, and that the President of the United States was the first person to sit in it.

Parliament.

HOUSE OF LORDS.

Monday.—The LORD CHANCELLOR communicated her Majesty's answer to their Lordships' Address.—The Earl of ABERDEEN, in reply to Lord BROUGHAM, said that nothing would be done by our negotiations with France to impede our exertions in the cause of humanity, and that the French Minister desired the abolition of the slave-trade quite as much as himself. The noble Lord strongly repudiated the charges made on the other side of the Channel, that in insisting on the right of search we sought any commercial, naval, or other selfish advantage.—At the instance of the Duke of WELLINGTON, Earl FITZWILLIAM abstained from making any remarks in moving for returns of the military force employed in Ireland at certain periods, and of the sums recently employed in military works in that country—these returns not being objected to by the Government.—The LORD CHANCELLOR having informed their Lordships that he had received a letter from Sir W. Parker, acknowledging the thanks of the House, the Earl of MINTO took the opportunity to express his regret that a Baronetcy had not been conferred on the gallant Admiral.—The Earl of HADDINGTON stated that it was the intention of the Ministry to bestow another honour when the Admiral hauled down his flag, and that the Admiral was satisfied with the decision, and the reasons for it.—Lord BROUGHAM objected to Lord Minto interfering with the Crown as the fountain of honour, but the discussion was put an end to good-humouredly by the Duke of Richmond, who presented a petition to the House against the bastardy clauses of the Poor-law Amendment Act.—The Duke of RICHMOND, on the suggestion of Lord Brougham, and on receiving some opposition from the Bishop of London withdrew his intended bill to legalize betting. The Noble Duke in doing so adopted the suggestions of the Law Lords to bring in another bill for stopping the *qui tam* actions, and, as he expressed himself, "defeating the objects of those scoundrels who, because last year their own practices were discovered, had raked up old Acts of Parliament, not for the sake of the public good, but to gratify their own revenge, and to fill their pockets if they could."—On the motion of Lord DENMAN the laws relating to gaming were referred to a select committee.—The Marquess of NORMANBY referred at some length to the Government having neglected to carry through any measures to enforce the recommendations of the commission for inquiring into the health of towns, and asked whether anything had been done, or was in contemplation.—The Duke of BUCCLEUCH spoke of the great difficulties there were in the way of legislating on the subject, and stated that he hoped in a short time to be in possession of information which would enable him to suggest some legislative measure, but he was not prepared to pledge himself on the subject.

Tuesday.—The Duke of RICHMOND brought under the notice of their Lordships a circular letter, dated the 2d September last, signed by the Assistant-Secretary of the Treasury, and addressed to the Clerks of the Peace of the United Kingdom, in which directions were given that in cases in which there was reason to suppose a prisoner charged with felony was possessed of property other than that found on his person, the magistrates were to cause inquiry to be made at the residence of such prisoner, or any other place frequented by him, in order to ascertain the value of such property, and to have it included in the return to the Treasury. The noble Duke contended that such a requisition would be illegal, and called on the Government either to withdraw the letter altogether or alter that clause of it.—Lord WHARNCLIFFE mentioned several cases in which property which had belonged to convicted felons, and which, by common law, was forfeited to the Crown, had fallen into the possession of persons having no right whatever to it. The object of this letter had been to remedy that wrong.—Lords BROUGHAM and CAMPBELL expressed their regret that a letter of such consequence should have been issued without the approbation of the Lord Chancellor or the Attorney-General. They were of opinion that to require a constable to inquire into the property belonging or supposed to belong to a prisoner, was to compel him to do what was illegal.—Lord REDESDALE presented 29 petitions from Lincolnshire praying for protection to Agriculture.—Upon this the Duke of ROXBURGHE expressed his hearty gratification at the declaration made by Government, that it was not their intention to reduce further the protection to Agriculture—a declaration which would remove much of the doubt and suspense which had so heavily weighed upon an interest already sorely depressed. He hoped this assurance of the Minister "would arm the farming interest to resist the many attacks that had been so unscrupulously and so unjustifiably made upon it, and that it would tend to restore confidence to that body which had so nobly stood up for their rights—he meant the Agriculturists of the country."—To questions put by Lord MONTEAGLE, the Duke of WELLINGTON stated that the Government did not intend to propose any Committee of Inquiry relating to the Bank of England, because there was sufficient information to legislate upon already before the House; and that they did intend to adopt measures during the present session for the renewal of the charter of the Bank of Ireland upon principles similar to those of the Bank of England.—The Marquess of NORMANBY presented a petition from certain Roman Catholics of Belfast complaining of the omission of all persons of their creed from the trials at Dublin. In compliance with the wish of their Lordships he abstained from making any remarks on this subject.—On the motion of the Duke of RICHMOND a bill for staying proceedings in the *Qui Tam* actions now pending on the subject of betting at races was read a first time and ordered for second reading on Thursday. His Grace gave notice that he intended to move its third reading on Friday, so as to send it down on that day to the Commons.

Thursday.—On the motion of Lord BROUGHAM, in the absence of the Duke of RICHMOND, the Actions for Penalties on Gaming Discontinuance Bill was read a second time, after some remarks from the Bishops of London and Exeter.

Friday.—On the motion of Lord MONTEAGLE, the School Teachers' (Ireland) Bill passed through committee, and was ordered to be read a third time on Monday.—Lord BROUGHAM moved the third reading of the Betting Legalisation Bill, which after several verbal amendments, was read a third time and passed.—The LORD CHANCELLOR inquired of the Marquis of Normanby, who had a motion respecting Ireland standing on the books of the House for Monday, if he intended to bring it forward though the trials should not be brought to a close by that day.

Lord BROUGHAM considered it would be most inconvenient to discuss such a motion before the trials were brought to a conclusion.—The Marquess of NORMANBY agreed to postpone his motion for the present. On Monday he would lay on the table the precise words of his motion, which should have reference to the causes of the discontent prevailing in Ireland.—Lord CAMPBELL laid on the table a bill to amend the Law of Libel Bill, which was read a first time.

HOUSE OF COMMONS.

Friday.—After the renewal of the Sessional Orders, Lord CLIVE brought up the report of the Address to her Majesty. On the paragraph assuring her Majesty of the support of that House in her maintenance of the Legislative Union between Great Britain and Ireland, Mr. S. CRAWFORD moved its omission on the grounds that it pledged the House to an approval of the proceedings now in progress in Ireland, and also to an inviolate maintenance of the Act of Union, to neither of which pledges was he willing to subscribe. This led to a general discussion, during which the conduct of the Irish Attorney-General in sending a challenge to Mr. Fitzgibbon was brought under the notice of the House by Mr. Roebuck, who demanded of the Government if they had resolved on the "instant and ignominious dismissal of this most unworthy officer."—Sir R. PEEL while avowing the act of the Irish Attorney-General as being not altogether defensible, denounced the condemnation pronounced by Mr. Roebuck as most unwarrantable and unjust. Allowances should be made for his position and for the provocations he had received. His was not a deliberative act. It was not like returning from the Court labouring under irritated feelings, and deliberately meditating a challenge. It occurred suddenly and was immediately taken up by the Court, and the Attorney-General expressed his regret for the act which he had done. His conduct was noticed by the Chief Justice in terms which must be very painful to the Attorney-General, having, as he had, his conduct so described by the highest authority. The Court itself having the whole case before it, and, having expressed its condemnation of the act which has been alluded to, trusted that it would be buried in oblivion, and the Attorney-General for Ireland expressed his regret that in the irritation of the moment he was induced to take the course which he had taken. "Now," concluded the Premier, "in answer to the question of the hon. and learned Member for Bath as to whether the Government have ordered or contemplated the dismissal of the Attorney-General for Ireland, I say at once that her Majesty's Government have not taken any such step—and that they do not intend it."—Mr. WYSE though opposed to the Attorney-General bore testimony to his exceeding forbearance and good temper during the sarcastic, pungent, and stinging personal allusions made to him by Mr. Sheil in his speech; and Lord ELIOT adduced his general amiable and conciliatory disposition, as an answer to the assault made on his character by Mr. Roebuck.—Lord STANLEY said, "The honourable and learned Member for Bath may be free from those infirmities of temper which might be exhibited under the influence of taunts and goads—infirmities not excited by one sarcasm, but by purposed, intentional, continued, and bitter personal taunts. The honourable and learned Member for Bath may be unmoved by such a course of irritation, but I am not ashamed, after long experience in the House, to say—and I speak it honestly, though perhaps with some shame to myself—that I have learned day after day how difficult it is to sit by and hear taunts thrown out before the House, without being provoked into some irritating word in reply, which I afterwards might regret. Feeling that infirmity myself, I at least can make allowance for one in that position." His Lordship then proceeded to prove that the insults offered to Mr. Smith had been predetermined and followed up for the purpose of goading him into some act of indiscretion, and read part of a letter written by Mr. Smith before the occurrence, in which he thus expressed himself:—"I see, day by day, systematic attempts to drive me into some act of indiscretion injurious to me and the Government. Speaker after speaker attempts to fix upon me some personal imputation." The noble Lord concluded by calling on the House to abstain from deciding on the question upon newspaper reports or exaggerated statements.—Mr. Sergeant MURPHY followed in support of Mr. Roebuck, and was answered by Sir J. GRAHAM, who stated that he was prepared to share in the responsibility of his colleagues, and entertaining the opinion which he did of the honesty, the talents, the public virtue, and the amiable private

qualities which distinguished the Attorney-General for Ireland, he was not prepared at the instance of political opponents, to yield to the demand that that right hon. gentleman should be ignominiously dismissed, as a member of his own profession had in his absence that evening called upon the Government to do.—Mr. SHAW warmly defended the Attorney-General and called up Serjeant STOCK, who testified to his talents and amiableness of character. After a long continuance of this discussion the House came back to the proposition before it, and divided on Mr. Crawford's amendment, when there appeared for striking out the paragraph, 35, against it, 142; majority, 107.—Mr. FRENCH now made a charge on the Government for appointing Englishmen and Scotchmen to situations in Ireland, and stigmatised the nomination of Lord Devon as a fresh insult to Ireland.—Sir R. PEEL replied, and Mr. S. CRAWFORD expressed his thanks to the Government for having appointed the commission.—Mr. DUNCOMBE withdrew his amendment respecting the county franchise in Ireland. The Address was then agreed to.—**Sir R. PEEL stated the Government did not intend to institute** any new inquiry respecting Joint-stock Banks, but that they would on their own responsibility, introduce a measure affecting the Bank of England and Joint-stock Banks generally. The Metropolis Improvement Bill was read a first time.

Saturday.—On the motion of Sir R. PEEL it was resolved that in consequence of the death of the Duke of Saxe Coburg Gotha, the father of Prince Albert, the order for presenting the Address to her Majesty by the whole House be rescinded, and the Address be presented by such Members as were Privy Councillors.

Monday.—Earl JERMYN appeared at the bar and read the answer of her Majesty to the Address. Various questions were asked, one relating to the Oregon territory respecting which Sir R. PEEL intimated that negotiations were still pending, and another by Mr. BLEWITT relating to the rumour that her Majesty was in debt, and that a consequent increase of the civil list would be necessary.—Sir R. PEEL gave this an emphatic contradiction, remarking that the whole course of her Majesty's life and habits might have shown that there was not a syllable of truth in the rumour, and that her Majesty is not one shilling in arrear.—Mr. GLADSTONE, as President of the Board of Trade, moved the appointment of a select committee to consider the standing orders relating to railways and the course which it might be expedient for Parliament to take with respect to applications for new lines or for new powers in relation to old lines. He intimated that it might be fitting to reduce the amount of deposit now required by the standing orders, and having regard to the growing importance of the subject he suggested that future railway bills should be referred to the Board of Trade before the introduction of them into the House of Commons. His present motion would not include any inquiry into the checks which it might be desirable to provide against the alleged abuses of existing railways. There were indications of a disposition to apply for competing lines; but such lines would not produce all those advantages to the public which are considered as attaching to competition in other matters, and he was not without hope that such advantages might be obtained from the good sense of the existing companies without any unlimited encouragement to competing lines. The object he chiefly desired was a reasonable arrangement for passengers of the third-class, which he thought there was a disposition to concede, and which he believed would be attainable without breaking down the fair principle of the general charges.—Mr. LABOUCHERE, while agreeing generally with what had been advanced by Mr. Gladstone, was not disposed to undervalue railway competition. If competing lines sometimes did no good, at all events they did no harm; and there were cases in which they were beneficial, as, for instance, the South Western and the Great Western railways to a certain extent competed with each other, and contributed thereby to lower rates of carriage. Any one who had travelled abroad and had witnessed the effects of low rates on the continental railways, of which artizans availed themselves in proceeding to their employment, would be sensible of the importance of the subject of third-class passengers, which was to be referred to the committee, and which he hoped would not be unnecessarily restricted in its investigations.—Mr. ROEBUCK did not like the half-and-half way in which it was proposed to deal with the subject. Why not include railways passed, as well as railways to come? Those already in existence had obtained monopolies at the expense of the public, and it was not desirable that the committee should be fettered. He should like to prevent such connections between railways as would amalgamate instead of keeping them competing lines—as gas companies were said to unite, and cheat the public by their unity. The subject of third-class passengers was also extremely important. On the Great Western there was a third-class train, but it went by night, not by day, the passengers had to stand, there was no covering, and at the stations there was neither fire nor shelter for them—evils aggravated by the time occupied, for while the first-class passenger reached his destination in 6 hours, the third-class took 24. The expense at which railways had been constructed was pleaded; but if advancing science showed that 2000*l.* a mile would suffice where 60,000*l.* had been expended, the public were not to be the sufferers.—Mr. C. RUSSELL, chairman of the Great Western Railway, gave a contradiction to some of Mr. Roebuck's allegations. The third-class carriages were furnished with commodious seats, and though they had no covering the company was extremely anxious to promote the comfort of the passengers, if it could be afforded at a reasonable expense. But no company could convey passengers at a rate which was not remunerating.—Mr. WALLACE remarked on the monopolising tendencies of the railway companies, who sought, he said, their own self-interest, and not the advantage of the public at large.—Sir R. PEEL pointed out that it was important not to interrupt the progress of legislation by retarding the period when the committee might report on matters affecting the interests of the various companies now applying to Parliament. The expense of these applications was very great; and it was right that as little delay as possible should be permitted to elapse before they ascertained the conditions on which their applications would be complied with. They had a perfect right to make new terms with new companies; but though not insensible to the evils of monopoly he contended that there was a great difference between new companies and those who had completed their undertakings on the faith of acts of Parliament. Mr. Wallace objected that they looked to their own interest. What else would you have them to do? Is not self-interest the vivifying soul of all commerce? We should take a comprehensive view of the subject, and never forget that it was private capital alone that achieved all these great enterprises; and though some companies might divide 10 or 15 per cent. more than was originally anticipated—though the shares of one might be quoted at 153, and another at 90, we must remember that there were others which had yielded no return, and if we deducted from the profits of the successful we were equally bound to compensate the unsuccessful. It would perhaps be well for railway companies to direct their attention to the results of the experiment of the Atmospheric Railway in Ireland, which had effected a great change in the opinions of many practical men; but though the House of Commons might devise means to keep up fair and open competition, it should equally avoid interference.—After some further conversation, concluded by some hearty denunciations of all railways from Col. SIBTHORP, the motion for the committee was agreed to. The only other business of the evening was the renewal of the select committee on the Merchant Seaman's Fund.

Tuesday.—Among other notices of motion Mr. COBDEN gave notice, for Tuesday week, to move for a select committee to inquire into the effects of import duties on tenant-farmers and farm-labourers.—In reply to Mr. LABOUCHERE, Sir R. PEEL stated that he considered our commercial negotiations with Portugal to be at an end, and that no advance had been made since last session in our negotiations for a commercial treaty with France.—**Sir J. GRAHAM moved for leave to bring in his Bill for the better regulation and amendment of the laws relating to the employ**ment of children and young persons in factories. This Bill will limit the labour of children between the ages of eight and thirteen to six and a half hours a day; young women between 13 and 18 will be restricted by it to 12 hours' labour; and women of every age, in cotton, silk, wool, and flax manufactories, will be confined to 12 hours' labour. With respect to education, he said that the experience of last year had determined him not to interfere with the quality of the instruction given to the children. It had been the desire of Government to form some scheme of instruction comprehending Scripture reading independent of doctrinal differences, but he was now convinced that reliance must be placed on the exertions of the millowners themselves. And it was no vague reliance, for he felt convinced that an honest rivalry had arisen between the Church and the Dissenters, and that great efforts would be made to diffuse the blessings of moral and religious education amongst the dense masses of the manufacturing population. At all events, he was not prepared to interfere, directly or indirectly, with the quality of the education to be given. **All he asked the House to do was, to give the children an opportunity** of attending school for at least three hours each day, except Saturday.—Mr. HUME designated this attempt at legislation as "a perfect folly."—Mr. S. WORTLEY, Mr. HINDLEY and Lord ASHLEY complimented the Government on their proposed measure, and leave was obtained to bring in the Bill.

On the order for going into a committee of supply, Mr. CRAWFORD moved a long resolution, setting forth a host of grievances and intending to be in the nature of a stoppage of the supplies. The resolution was twofold, the first half insisting on its being the immediate duty of the House to make inquiry into grievances alleged or complained of; the second denying the competency of the House to grant supplies, or to perform any legislative functions whatever, by reason of defects in its constitution.—Mr. WILLIAMS seconded the motion.—Sir R. PEEL exposed its impracticability, even if comprehensible. If one-tenth of the "grievances" enumerated in this lengthy composition were inquired into by any commission of the House, the real business would have to be postponed to the Greek Kalends. Besides the House would hardly be so silly as to vote itself "a criminal," which it would do if it agreed to this resolution propounded.—Mr. HUME objected to the resolution, but nevertheless gave it his support.—On a division there were—For Mr. Crawford's resolution, 22; against it, 130: Majority, against it, 108.—A conversation touching the appointment of the landlord and tenant commission in Ireland followed, in which Sir R. PEEL complained that, after selecting persons with the view of being agreeable to the Opposition, he found that they were still dissatisfied.—After explanations given by the LORD ADVOCATE of SCOTLAND respecting certain imprisonments arising out of a riot at Roskeen, the House went into a committee of supply *pro formâ*.—Mr. J. JERVIS obtained leave to bring in two bills relating to the recovery of small debts.

Wednesday.—**After the presentation of a few petitions, Lord PALMERSTON gave notice, for the 19th inst., to move an address to her Majesty, praying her to consent to no modification of the treaties now in force for the suppression of the slave trade, which might render more easy the perpetration of so detestable a crime.—To a question put by Mr. WYSE, Sir J. GRAHAM said Government was not yet in a position to come to a definite opinion respecting the grants that would be made this year for educational purposes.—Mr. HUME gave notice of his intention to move for a committee to inquire into the frauds that have been committed in the tobacco and silk trades; also to inquire into the expense of the Coast Guard establishment.**

Thursday.—**Lord ASHLEY moved an address to the Crown, praying her Majesty to take into her consideration the situation and treatment of the Ameers of Scinde, and that she will direct their immediate restoration to liberty and the enjoyment of their estates, or with such provision for their future maintenance as may be considered a just equivalent. The Noble Lord commenced his speech by saying that he had thought of abandoning this motion until the appearance of a letter in the papers bearing the signature of Sir Henry Pottinger had rendered his case irresistible—for in that letter Sir Henry described the proceedings that had taken place in Scinde as the most unprincipled and disgraceful that had ever stained our faith and honour. His Lordship then reviewed the history of our connexion with Scinde, and forcibly dwelt on the claims which the Ameers had established on the consideration and sympathy of the British House of Commons. He contended that they had been long and constantly faithful, with the exception of their last sole falling off; that they had been caressed and treated with the utmost delicacy when we wanted their assistance, and that now when they were fallen we had treated them with unnecessary harshness, injustice, and cruelty. If they had become our enemies it was only in the height of our prosperity; they had ever been friends to us during the period of our adversity.—Mr. ROEBUCK then rose, and in a three hours' speech proposed three resolutions condemning Lord Auckland's conduct as the foundation of Lord Ellenborough's recent measures, and calling on the House to treat the Ameers with every consideration.—Mr. EMERSON TENNANT denied the authenticity of the letter purporting to be written by Sir H. Pottinger, and Sir J. HOBHOUSE replied to Mr. Roebuck's attack upon Lord Auckland.—Sir R. PEEL having declared that nothing could justify him in consenting to the motion, was ready to consent to agree to that moiety of the address which prayed her Majesty to take into consideration the situation and treatment of the Ameers of Scinde. To the remainder he objected, because it would be a vote of censure on the Government in India, and because he believed it impolitic and unwise to attempt to make rules here to restrain the actions of the Executive in so distant a part of our empire. The Ameers should be treated with every consideration and respect due to their former state and their present misfortunes.—Lord JOCELYN supported Lord Ashley's motion.—Sir C. NAPIER opposed it.—Lord J. RUSSELL would not take on himself the responsibility of voting for the motion; but even if it were not carried, the Noble Lord who proposed it would have the consolation of knowing that if there had been originally no intention of showing proper respect towards the Ameers, this motion would serve to effect that object.—Lord ASHLEY not being willing to accept the compromise offered him by the Premier, went to a division, when there were for the motion, 68: against it, 202: majority, 134.—Mr. DIVETT then moved an address to the Queen, praying her to dismiss F. R. Bonham, Esq., from the office of Storekeeper of the Ordnance. The hon. Member's charges against Mr. Bonham, which were made amidst repeated peals of laughter, denounced him as the confidential electioneering agent of the Conservative party, the confidential friend of the Prime Minister, &c. But as the hon. Member could not find a seconder his motion fell to the ground.**

Friday.—**The SPEAKER entered the House at the usual time, but there being only 34 members present at four o'clock, the right hon. gentleman adjourned the House.**

CITY.

Money Market, Friday. — Consols for the account closed at 97⅜; Three per Cents. Red., 98¼ to ⅛; Three-and-Half per Cents. Red., 103⅛; New Three-and-Half per Cents., 102 ⅛; Bank Stock, 192½ to 193; Exchequer Bills, 67*s.* to 69*s.* prem.

Metropolis and its Vicinity.

The Weather.—A heavy fall of snow took place on Saturday morning, succeeded by another fall on Sunday. On Monday a severe frost set in, and the thermometer fell to 22° Fahr., with every prospect of a continuance of frost. A change of temperature, however, has since taken place, and the snow on Wednesday had disappeared.

The Atlas Prize Essay.—Some months since the proprietor of the *Atlas* newspaper offered three prizes of 100*l.*, 50*l.*, and 25*l.*, for the three best essays on the distress of the country, and the best mode of alleviating it. The candidates for the prizes were 158, and the following were the adjudicators:—Sir David Brewster, Mr. Herman Merivale, late Professor of Political Economy at Oxford; Mr. George Pryme, Professor of Political Economy at Cambridge; Mr. Thomas Tooke, and Professor Wilson. The arbiters have decided that Mr. Samuel Laing, late Fellow of St. John's, Cambridge, is entitled to the premium of 100*l.*; that the writer of the Essay bearing the initials "B. C. E." is entitled to the second premium of 50*l.*; and that Mr. Edward Baines, of Leeds, is entitled to the third premium of 25*l.*

Clergy Orphan Corporation.—The annual general court of the governors of this institution was held on Saturday afternoon at the Freemasons' Tavern, to receive the report of the committee, and for the election of candidates for admission into the school. The Archbishop of Canterbury presided. The Rev. Dr. Sheppard stated that the affairs of the corporation were in a most satisfactory position; and that there were at present 140 orphans in the schools. The Rev. Doctor then read the auditor's report, from which it appeared that the annual subscriptions amounted to 1,122*l.* 15*s.*; donations, 322*l.* 10*s.*; dividends on stock, 2,879*l.* 5*s.* 11*d.*; legacies, 1,600*l.*; which, with other items, made a gross income of 6,611*l.* 9*s.* 11*d.* The expenditure amounted to 6,527*l.* 1*s.* 2*d.*, leaving a balance of 84*l.* 8*s.* 9*d.*, in favour of the institution. The apprenticing fund for the past year amounted to 795*l.*, of which 262*l.* 10*d.* had been contributed by the trustees of the Cholmondely charities. There had been 18 boys and girls apprenticed out, with whom 355*l.* had been paid in apprentice fees. The balance had been laid out in the purchase of Exchequer bills. The report having been received, the Bishop of London, after adverting to the valuable assistance which the institution had derived from the countenance given to it by the Most Rev. Prelate in the chair, moved that his Grace be requested to continue to preside over the charity. The motion having been carried unanimously, His Grace said that he accepted the office with great pleasure. He had been connected with the Clergy Orphan Schools for upwards of thirty years, and though he was now well stricken in years, and could not be supposed to render any very efficient service, still he felt it his duty to do all in his power to promote the well-being of an institution which he was aware must be a great consolation to his poorer brethren, from the prospect that it afforded of a good education for their orphan children. The vacancies in the schools were then filled up by the election of five boys and two girls, and it was agreed that the Rev. Dr. Sheppard and Mr. C. Barnewell should henceforth be joint treasurers.

State of the Streets.—At the adjourned meeting of the Commissioners of Sewers on Tuesday, Mr. Gore, the contractor, announced that he had come to an arrangement with the Patentee of the Street Sweeping Machine, and that one-sixth of the City would henceforth be cleansed by the machine. It was then reported by the inspectors, that about 200 streets and lanes had not been cleansed after the fall of snow on Friday and Saturday. A motion was made to rescind Mr. Gore's contract, but ultimately it was agreed to wait until the court could judge of the arrangement effected with the patentee of the machines, Mr. Gore being given to understand, that for every neglect on the part of the machines he would be held responsible, for the members of the Court of Sewers, as well as the public at large, were determined to have the streets of the City kept in a clean and proper state.

Victoria Park.—On Monday, the term having expired for clearing away the land lately purchased by the Crown at Old Ford and Bethnal-Green for the commencement of the new park, the Crown took possession of its newly-acquired property. No other preliminary steps, however, have as yet been taken, although nearly three years have elapsed since the passing of the Act empowering the Commissioners of Woods and Forests to purchase the land required for the formation of the park.

Exclusion of Catholics from Juries.—A public meeting was held on Wednesday, at the Freemasons' Tavern, for the purpose of considering the propriety of addressing her Majesty on the conduct of the Law Officers of the Crown in Ireland in excluding Roman Catholics from the Jury on the State Trials. The room was crowded long before the commencement of the proceedings. On the platform were Lords Camoys and Stourton, the Hon. C. Langdale, Mr. Howard, M.P., Sir D. Vavasour, Bart., P. C. Maxwell, Esq., and several other gentlemen. Lord Camoys was called to the chair, and read the requisition, which was signed by 104 persons; his Lordship also stated that among the requisitionists appeared the names of eight Peers, and the adhesion of the Earls of Traquair and Shrewsbury had since been received. Lord Stourton proposed the first resolution—"That the abolition of civil distinctions on account of religion was the avowed object of those who introduced and understood the principle of the Act for the emancipation of the Roman Catholics." Several other resolutions were put and carried deprecating the late proceedings in Ireland in selecting the jury panel, and adopting an address to her Majesty on the subject.

Anti-Corn-Law League.—The third weekly meeting of the League was held on Thursday night in Covent Garden Theatre. Mr. Wilson presided, and the meeting was addressed by the Hon. Mr. Villiers, Mr. Cobden, and Sir De Lacy Evans.

London Free Seceders.—The Presbytery of Edinburgh have suspended and deprived the Rev. James Hamilton,

the present minister of the Scotch Church in Regent-square, and declared him no longer capable of holding any preferment in the Church of Scotland or in connexion with it. The trust deeds of that place of worship bind it to be in strict connexion with the Established Church of Scotland, and Mr. Irving was removed from it on the sole ground that he was cut off by his Presbytery in Scotland.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Jan. 27.—West Districts, 177; Northern, 170, Central, 192; Eastern, 252; Southern, 220. Total, 1011. Weekly average for the last five years, 946.

Provincial News.

Aylesbury.—The annual meeting of the Agricultural Association of Buckinghamshire was held in this town on Saturday for the purpose of auditing the accounts, fixing the premiums, and other routine business. The members afterwards dined together; the Duke of Buckingham was in the chair. The dinner was not so fully attended as last year, which was ascribed to the unfavourable state of the weather. After the usual routine toasts the Duke of Buckingham made the speech of the day in returning thanks for the toast of his health. His Grace said, "I pride myself upon being regarded as the mouthpiece of this society, a society which has for its object not only the well-being of the farmer but of the poor labourer also. It is of no use talking of the prosperity of the farmer unless the prosperity of the labourer is to be considered as a necessary adjunct. I now declare as connected with a party and as a landlord that unless the well-being of the labourer is to be attended to I would not give a single straw for the present agitation. The first agricultural association that had been formed was the present one, and I am truly pleased to observe that there is now scarcely a single county that cannot boast of a similar one. What was the consequence? The science of agriculture had received an impetus which had given rise to a variety of improvements that had never been dreamt of before. But we are told by some parties that Ministers are wavering; and therefore notwithstanding the otherwise great advantages that might arise from these associations, the farmer is at a loss to know what he really ought to do. Now I think if gentlemen would only carefully peruse what Sir R. Peel as the head of the Government had said upon the subject, there would be no difficulty in ascertaining what Ministers really meant. I have been charged with inconsistency—but where was the man that could prove that charge? I think I am not saying too much when I assert that no man in the country has endeavoured to do more for the support and well-being of the agricultural interest than I have."

Barnard Castle.—An Anti-Corn-law meeting was held in this town on the 26th ult. in order to assist the League in raising the 100,000*l.*, and to spread information concerning its operations for the present year. Already last year's contributions are nearly doubled.

Birmingham.—A meeting in favour of free trade was held in this town on Monday at which the Chartists attempted to interfere with the business of the meeting. A riotous scene took place which ended in the Chartists being turned out of the room. Mr. Cobden, Col. Thompson and other gentlemen then addressed the meeting in favour of free trade, and the sum of 850*l.* was subscribed in favour of the League Fund.

Bury St. Edmunds.—A meeting of Suffolk farmers was held in this town last week for the purpose of taking measures to oppose the League. About 500 persons were present, the greater part being tenant-farmers. Geo. Rodwell, Esq., presided, and the meeting was addressed by Messrs. Gayford, Mr. H. Heigham, and Mr. Edwards, tenant-farmers, by Lord Euston, Sir T. G. Cullum, Bart., and other landowners. Resolutions in favour of protection were carried, and upwards of 300*l.* subscribed for the purposes of the meeting.

Cambridge.—On Saturday a meeting of Cambridgeshire Agriculturists was held in this town for the purpose of considering the best course that could be adopted for opposing the progress of the League, and for securing due protection to agriculture. About 600 persons were present, the great majority of whom were tenant-farmers. Mr. Peter Grain was called to the chair, and was supported by the Earl of Hardwicke, the Hon. E. Yorke, Sir V. Cotton, &c. Resolutions were passed pledging the meeting to resist the League and any further inroads on protection to agriculture, and upwards of 500*l.* was subscribed in the room.

Carlisle.—A meeting of the owners and occupiers of land in the county of Cumberland was held in this town on Saturday, to consider what measures should be adopted for opposing the progress of the League, and for securing protection to agriculture. The number attending the meeting amounted to between 400 and 500, and as on former occasions, it was composed of men of all parties. Sir G. Musgrave was called to the chair, and was supported by Mr. E. W. Hazell, Mr. Brisco, Mr. Graham, Mr. Head, Major Field, and other landowners. Resolutions in accordance with the views of the meeting were unanimously agreed to; and a "Protection Association" for the district having been formed, a petition to Parliament which embodied the resolutions was adopted and numerously signed. The subscription in the room amounted to upwards of 200*l.*, and a large addition is expected from the county.

Devizes.—A meeting in favour of protection to agriculture was held in this town on Wednesday, and was attended by about 1200 persons, among whom were the Hon. Sidney Herbert, M.P., Mr. Long, M.P., Mr. Bennett, M.P., Mr. Neeld, M.P., Lord Ernest Bruce, M.P., Mr. Heneage, M.P., Mr. H. S. Sotheran, Mr. Wade Browne, Mr. Ludlow Bruges, M.P., &c. Mr. G. Brown presided, and the meeting was addressed by Mr. Mills, a tenant-farmer, Mr. W. P. Hayward, the Hon. S. Herbert, Mr. Bennett, M.P., and other gentlemen; and resolutions in favour of protection were unanimously carried. Upwards of 1200*l.* were subscribed at the meeting.

Doncaster.—A tea-party in favour of the League was held on Tuesday week in this town, which was numerously attended, by far the greater number present being females. The subscriptions now raised in Doncaster amount to 90*l.* and it is believed that that sum will be increased to 100*l.*, nearly 30*l.* more than was raised last year.—On Saturday a meeting of landowners, farmers and others was held in this town as a sequel to one held on the previous Saturday, when the tenant-farmers of this district agreed to solicit the aid of the landowners and resolved that a public meeting be held as early as possible, which the landed interest should be invited to attend. Accordingly on the 3d inst. a great number of the neighbouring gentry assembled to give their support to the measures of the Doncaster Protection Society. Sir W. Cooke, of Wheatly Park, presided, and the meeting was addressed by Col. Fullerton, of Thryberg, and other gentlemen. Resolutions in favour of protection were unanimously carried and a liberal subscription was entered into.

Durham.—On Saturday a meeting of agriculturists was held in this city, for the purpose of adopting measures for opposing the progress of the League. The meeting was numerously attended. Mr. J. Wood, a tenant-farmer, was called to the chair, in which he was supported by R. S. Surtees, Esq., of Hamsterley-hall; F. D. Johnson, Esq., of Aykley Heads; W. L. Wharton, Esq., of Dryburn; T. D. Shaltoe, Esq., of Whitworth; Thomas Davison, Esq., of Durham; A. Smith, Esq., of Langley-grove, &c. A letter was read from the Duke of Cleveland approving of resisting the League and recommending a county meeting to be called. A long discussion ensued, which ended in the appointment of a committee of owners and occupiers of land, to superintend a meeting of the whole agricultural interest of the county, and to consult the Duke of Cleveland as to the time when it would be most convenient to his Grace to attend, in order that as little delay as possible should occur.

Fareham.—On Monday week a meeting for the protection of agriculture was held in this town, attended by about 200 persons. Mr. Robert Stares presided, and resolutions forming a Protection Society were adopted.

Gloucester.—The High Sheriff has refused to convene a county meeting "to take into consideration the existing restrictions on commerce, especially those affecting the necessaries of life, and to hear Mr. Cobden and others on these subjects." The ground he alleges is that "the avowed objects of the proposed meeting appear to be not so much to give the freeholders of the county an opportunity of expressing their sentiments as to listen to the arguments of strangers." Among the requisitionists were the Earls of Radnor and Ducie, and the following Members of Parliament:—Mr. Langston, Mr. Philpotts, Mr. John Martin, Mr. Pryse Pryse, Mr. Powlett Scrope, and Mr. Stanton. A meeting however will take place on the 24th instant, the following six magistrates having, in consequence of the High Sheriff's refusal, appointed that day for holding the meeting: The Earl of Ducie, and Messrs. E. Holland, L. S. Austin, L. Clutterbuck, J. R. Barker, R. Wynniatt, and C. E. Hanford.

Lincoln.—On Friday a meeting of the Lincoln and Lindsey Protection Society was held in this city, C. Chaplain, Esq., of Blankney, in the chair, when it was resolved to prepare and present petitions to both Houses of Parliament as early as possible, praying that no alteration should be made in the corn and provision laws. It was resolved also that the secretary write to the different associations in the county to appoint a deputation to meet a committee of this society on Tuesday the 10th of March, in order to form a central society for the whole county for the protection of agriculture.

Liverpool.—In consequence of the late disagreements in the district Court of Bankruptcy, the Lord Chancellor has made arrangements by which Mr. Skirrow has been removed to Manchester, and his place supplied by Mr. Serjeant Ludlow, who will preside in this Court in conjunction with Mr. C. Phillips.

Louth.—A meeting of Agriculturists was held in this town on Wednesday, J. W. Yorke, Esq., in the chair, at which resolutions were passed pledging the meeting to oppose the League and adopting a petition to Parliament in favour of protection.

Middleton.—On Monday a meeting of the working classes of this town was held, when 29*l.* was collected towards the League fund. The total paid by the 7000 inhabitants of Middleton is upwards of 370*l.*

Newark.—A meeting was held in this town last week for the purpose of adopting measures to resist the League. Col. Rolleston, M.P., and numerous other landowners were present. Resolutions were passed establishing a society for the protection of agriculture, and upwards of 120 gentlemen put down their names in the room as members. A committee was formed to conduct the proceedings of the society and appoint sub-committees to canvass for subscriptions in their respective districts.

Newcastle.—Mr. Wakley, a glass-merchant, brother to Mr. Wakley, M.P., coroner for Middlesex, has been appointed official assignee of the Court of Bankruptcy for this town. The appointment is worth 2000*l.* per annum.

Oldham.—On Tuesday week the Oldham committee of the League forwarded their second remittance to the League fund, which with the former payment makes the sum of 769*l.* 4*s.* A third remittance will be forwarded in a few days, and it is expected that the subscriptions will ultimately exceed 1000*l.* Last year the amount paid in to the 50,000*l.* fund from Oldham was only 600 guineas.

Oxford.—The answer of the Chancellor, Vice Chancellor, and heads of houses to the lay address against the Tractarian party, signed by Lord Ashley and other members of the Church of England has just been published. It is signed by the Duke of Wellington as Chancellor, and by Dr. Wynter, Vice Chancellor, on behalf of the heads of houses, and it is said to have been written by the Duke himself. The following is an extract:—"It is undoubtedly true that within the last few years certain tracts or pamphlets have been published by several distinguished members of the University, containing opinions and sentiments considered by many to be not conformable to, or consistent with, the doctrines of the Reformed Protestant Church of England as embodied in the Book of Common Prayer, and in the articles of religion called 'The Thirty-nine Articles.' The opinions and doctrines contained in these tracts or pamphlets have been considered, discussed, and replied to in other publications, and those discussions have at different times attracted more or less of the public attention. Against the prevalence however of erroneous opinions among its members generally, the University possesses a safeguard in the statute enacted more than two centuries ago, which provides that every candidate for matriculation should subscribe the Thirty-nine Articles; and every candidate for a degree should again subscribe the Thirty-nine Articles, and in addition thereto the Three Articles in the 36th Canon. The authorities of the University have not lost sight of their duty in enforcing a strict compliance with this statute; nor have they shown themselves indifferent to the improvement of religious instruction within the University; for when her Majesty was enabled by recent acts of the Legislature to provide for the foundation, maintenance, and regulation of additional Professorships of Divinity, the authorities of the University with the assistance of Convocation adopted every measure for which they were competent, to carry into execution the views of Government and of Parliament. And they trust that by perseverance in a course of moderation and watchfulness, they will be enabled under the Divine blessing to train up the youth committed to their care in the pure principles of the Reformed Church of England."

Salisbury.—A meeting was held in this city on Tuesday to oppose the League, A. Hussey, Esq., M.P., in the chair. A working committee was appointed and a subscription entered into for the purpose of furthering the interests of protection.

Spalding.—Earl Spencer has addressed a letter to Mr. Bonner, honorary secretary of the Spalding Association for the Protection of Agriculture, in answer to his official letter, calling on his Lordship in the name of the society to resign his office as President of the Royal Agricultural Society. The following is an extract from Lord Spencer's letter:—"Believing, as I do, that that society is doing a great deal of good by the improvement which it is tending to produce in the agriculture of the country, and wishing therefore most earnestly to do all in my power to support it, no personal consideration would induce me to hold the office of its President for one moment if I thought that my resignation of that office would be advantageous to the society. As however upon the best consideration I can give to the subject, I am convinced that my resignation of that office, for the reasons stated in the paper which you have inclosed to me, would be extremely detrimental to its interests, I must decline to comply with the request of the gentlemen for whom you are acting. I beg to say that the opinion which I have lately expressed upon the Corn Laws is no new opinion of mine; I held it, as is perfectly well known, long before the Anti-Corn-law League, with which I have no connexion whatever, was in existence."

St. Albans.—A meeting was held in this town on Friday, for the purpose of forming a Protection Society for the county of Herts, in order to raise a fund to meet the expenses of printing and circulating cheap periodicals, and to defray other charges incident to an organized system of opposition to the efforts of the League. The meeting was very numerously attended, the Court-house being crowded in every part. Mr. G. Passingham presided, and was supported by Lord Grimston, the Hon. Mr. Ryder, Mr. A. Smith, M.P., the Marquess of Salisbury, the Earl of Verulam, the Earl of Essex, Sir John Sebright, the Hon. and Rev. Mr. Capel, Sir A. P. Cooper, &c. Resolutions condemning the League and free trade in corn and establishing a Protection Society were unanimously adopted, after which a subscription was opened, which amounted to 1000*l.* before the close of the meeting.

Stafford.—A meeting in favour of Agricultural Protection was held in this town on Tuesday, Lord Sandon in the chair. The meeting was addressed by Earl St. Vincent, Lord Ingestrie, M.P., Lord Newport, M.P., Major Chetwynd; T. H. Parker, Esq.; Watts Russell, and C. B. Adderley, Esqrs., Members for North Staffordshire; Mr. Kynnersley, and other gentlemen. A petition to both Houses of Parliament was adopted and in the course of the meeting a number of signatures were obtained. A subscription was also entered into, and at the close of the proceedings upwards of 400*l.* had been contributed.

Wellington.—On Monday a meeting was held in this town to oppose the progress of the League, Mr. Charlton of Apley Castle in the chair, supported by a large number of landowners and farmers. Resolutions were passed in favour of protection and condemning the League, and petitions to both Houses of Parliament embodying the resolutions were unanimously adopted.

Wetherby.—A meeting of landowners and tenant-farmers was held in this town last week, the Earl of Hare-

wood in the chair, at which resolutions condemning the League, and adopting petitions to Parliament in favour of Protection were unanimously carried.

Winchester.—A large meeting of Agriculturists, principally occupiers and tenant-farmers, was held in this city on Monday, for the purpose of taking steps to support the Agricultural interest at the present crisis. Nearly 2000 persons were present, a large proportion of whom were owners or occupiers of land. Among them were Sir W. Heathcote, Bart., M.P.; Mr. Compton, M.P.; Henry Knight, Esq., of Chawton Park; Sir H. Tichbourne, Bart.; Walter Long, Esq.; W. Antley Sclater, Esq., and a large body of owners and occupiers of land. Mr. Stares, a tenant-farmer, was called to the chair. Resolutions in favour of Protection, and condemning the League, were unanimously carried, and a committee was appointed to carry out the objects of the meeting.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1301*l.*; Birmingham and Gloucester, 1650*l.*; Eastern Counties, 3484*l.*; Edinburgh and Glasgow, 1,786*l.*; Great Western, 11,698*l.*; Grand Junction, 6914*l.*; Glasgow, Paisley, and Ayr, 1136*l.*; Great North of England, 1233*l.*; London and Birmingham, 13,622*l.*; London and South Western, 4402*l.*; London and Blackwall, 596*l.*; London and Greenwich, 704*l.*; London and Brighton, 2793*l.*; London and Croydon, 211*l.*; Liverpool and Manchester, 4004*l.*; Manchester, Leeds, and Hull, associated, 5199*l.*; Midland Counties, 2248*l.*; Manchester and Birmingham, 2801*l.*; North Midland, 3900*l.*; Newcastle and Carlisle, 1311*l.*; South-Eastern and Dover, 2253*l.*; Sheffield and Manchester, 466*l.*; York and North Midland, 1345*l.*—The meeting of the Grand Junction company took place at Liverpool last week. A dividend was declared at the rate of 5*l.* per share, it being understood that these payments will in future be made quarterly and the warrants delivered at the residences of the shareholders. The profits of the half-year according to the balance-sheet of the directors was 127,176*l.*, which with the addition of 616*l.*, the surplus of the half-year's working, makes a sum of 127,792*l.* for division. To pay the dividend of 5 per cent., however, it would take little more than 110,000*l.*, but as this was the most profitable half-year it was proposed that the large balance should be carried over to equalise the next half-yearly payment, and continue the rate at 10 per cent. in order to retain permanent and unfluctuating the value of the stock in the market. The Lancaster and Carlisle and Holyhead lines in connection with this railway are receiving every attention at the hands of the directors.—The Manchester, Bolton, and Bury Company, at their meeting last week, announced a dividend of 2*l.* per share out of the joint profit of the rail and the canal working in conjunction with it, and a respectable surplus is left. The traffic of this line is expected to increase under new arrangements made with the canal proprietors.—The remaining portion of the South-Eastern Railway, from Folkestone to Dover, was opened on Tuesday. All the French authorities, mayors and corporations, from Boulogne and Calais, had come over to honour the ceremony by their presence, and were attended by a French band belonging to the National Guard of Calais. At four o'clock the special train, driven by the "Shakespeare" engine, was put in movement from Folkestone, bringing the directors and such visitors as had arrived from town to witness the ceremony. Ten minutes sufficed for the train to clear the road and tunnels under Shakespeare's Cliff, and in issuing from the last archway it was greeted by a salute of artillery, and the huzzas of a crowd of English and French spectators. On the directors alighting they were received by the Mayor and Town Council of Dover, attended by the Prefects of Calais and Boulogne. An English band played a national air, and was followed by the French band striking up "God save the Queen." Such a sight on Dover beach, with the Union-jack and tricolor intermingling was calculated to belie every tale of international enmity. The Mayor of Dover, Mr. Clarke, then delivered an address to the Directors of the Railway, after which the procession went in order through the streets, the French band and its colours leading the way, followed by the Mayor, and the authorities of Dover, Calais, and Boulogne. A dinner of 250 covers was afterwards given by the town council in the theatre, at which all the French visitors were present. The whole line from London to Dover is now open to the public. The engineering difficulties of this last portion of the line are of a stupendous character, and though only seven miles in extent, the estimate for its execution amounted to one-fourth that of the whole distance to London. The high chalk hills interposed between Folkestone and Dover induced the engineer, Mr. Cubitt, to carry the line along the sea-shore, but even in doing this it has been necessary to make many deep excavations and high embankments, and to cut two tunnels, each of which is nearly a mile long.

IRELAND.

THE STATE PROSECUTIONS.—*Sixteenth Day.*—On Thursday the Court of Queen's Bench was delayed for a quarter of an hour by the absence of one of the jury. During the interval, Mr. Henn, Q.C., on the part of the traversers, stated that, as Hilary term had closed on the previous day he did not think the Court competent to proceed with this trial, and he therefore submitted very respectfully that a note should be taken of his objection. The Lord Chief Justice said—Certainly, the Court will take a note of the objection.—Mr. Whiteside, Q.C., was then heard on the part of Mr. Duffy. He commenced by observing that the term "conspiracy" taken in its etymological sense did not imply anything criminal, and used in reference to men seeking a repeal of the Union meant no more than that, like members of other societies, merely of taste, or politics, or conviviality, they were of the same sentiments and dispositions on a certain political subject. In that there was nothing criminal. Their union was formed for the purpose of giving greater effect to their efforts. No great political changes can be expected to be brought about, however beneficial they may be in themselves, without a due exercise of what is called the "pressure from without." It should be recollected that the overt acts set out in the indictment were not substantial matters of charge, but evidence only of that "conspiracy" which was the gist of the crime. The traversers were accused of conspiracy only—of conspiring to excite discontent among her Majesty's subjects—hatred of the laws—and to bring about changes in the constitution by the display of great physical force, and so forth. The Attorney-General, he admitted, had stated the case with great moderation and temper, and the gentlemen engaged for the Crown generally had conducted it with candour and fairness. He agreed in the legal definition of conspiracy as given by the Attorney-General. It consisted in designing either to do or to seek a legal thing by illegal means, or an unlawful one by legitimate means. But he had some exception to make to the cases cited by the Attorney-General, and would show that they were susceptible of distinctions favourable to his views which it was important to allude to. The Learned Gentleman then went through all these cases addressing his argument of course much more to the Learned Judges than to the Jury. The object of those who sought merely a Repeal of the Union was he contended a perfectly legitimate one. What were the means used to attain it? The holding of great meetings was one amongst others, and was that illegal? If one or two thousand persons would constitute a lawful meeting, what were the precise number more that would make it unlawful? Seventy thousand persons assembled at Hillsborough, and no question was ever raised as to the lawfulness of the assembly. Meetings would consist of a greater or less number of persons, according to the importance and extent of the object they had in view. The Learned Gentleman then gave a sketch of several "monster meetings" which had been held in England of late years, and which had never involved the persons who joined them in the penalties of a State prosecution. He referred in particular to the assemblage in London of two hundred thousand persons in 1834, to present a petition to Lord Melbourne in favour of the Dorsetshire labourers. On that occasion Dr. Wade arrayed in a clerical dress—just as Mr. O'Connell went to Mullaghmast in his alderman's gown—and an immense body of people marched in procession through the streets, without experiencing the slightest interruption or even remonstrance from the authorities. Another great meeting was held at Birmingham in 1831, before the passing of the Reform Bill. Many of the concomitants of that meeting exceeded all that was irregular or alarming in anything that had been witnessed at any of the monster meetings held in Ireland; yet no prosecution was ever instituted against its authors; but the result which they looked for, namely, Parliamentary Reform, was very soon after attained. Another monster meeting was held in Yorkshire in 1832, to express the opinions of the people on the subjects of the Poor Law and Factory Bills, and no prosecution followed. Lord Ashley's Ten-hours Bill—a most beneficial measure—was the only consequence. The Learned Gentleman then gave a minute description of the great Hillsborough meeting held in the north of Ireland in 1834, the object of which was to make a demonstration in favour of the Government in opposition to the agitation of Repeal, and asked, was that to be denied to the south of Ireland which was so easily and kindly permitted to the north? As to the order and peacefulness with which the great Repeal meetings had been conducted, there was no question raised on the subject—it was admitted on all sides. Yes, but it was insisted that this was un-Irish, and therefore something peculiarly dark, mysterious, and portentous. The Learned Gentleman treated this topic with great pleasantry. He afterwards touched on various parts of the evidence adduced for the Crown—and, amongst others, the devices and pictures inscribed on the cards and diplomas made use of by the Repeal Association, which he turned into ridicule with the happiest play of wit. The hearing of the speech occupied the entire day, and at length Mr. Whiteside sunk back into his chair perfectly exhausted. Mr. Moore, Q.C., called the attention of the Court to the fact that Mr. Whiteside had not concluded his address, when the Chief Justice, who, as well as the other Judges, had evidently paid the utmost attention to his eloquent and argumentative speech, said they would not consider it concluded.

Seventeenth Day.—On Friday Mr. Whiteside resumed his speech, and appears to have sustained the high strain of eloquence which so much interested and delighted his auditory on Thursday. He commenced by adverting to that charge in the indictment which imputed to the traversers the design of bringing the courts of law into disrepute, and establishing courts of their own in their place. He maintained that the system which they endeavoured to found was purely one of arbitration, or a settlement of disputes in a friendly way, without referring them to the recognised tribunals. Was there anything criminal in that? Why, Christianity commended it—moralists approved of it—and the law itself lent it its sanction. To prove the two first of these propositions, he quoted Paley and St. Paul; and for testimony to the third, he cited several law authorities and Acts of Parliament. So much for the crime of not going to law, and providing means for the people to make those amicable settlements of their disputes which were sanctioned by such high authority. The traversers were charged with using too much freedom in commenting on a speech delivered by her Majesty in Parliament. But in the exercise of this liberty they were encouraged by usage and principle; by principle, for it was quite constitutional to consider a Royal speech as that of the Minister; and by usage, as precedents of such freedom without number were to be found on the subject. Again, it was imputed to the traversers as something sacrilegious that they contemplated the repealing of an Act of Parliament which was declared to be permanent, perpetual, and almost irrevocable. But there was no immortality in such matters. The Act of Union itself had repealed other Acts which were in their time just as much pronounced to be "for all generations." To say, therefore, now, that the Act of Union was irreversible would be to cut away the very foundation on which it rested. It was curious that one of the traversers had exposed himself to the attack of the Attorney-General for asserting that Her Majesty could issue writs to summon a Parliament in Ireland on her own mere authority—for presuming to carry the power of the Crown too far. But this prerogative was asserted by most writers on the subject—by Mr. Chitty, among others, and had never been taken away by any express Act of Parliament. The Learned Gentleman next took up the topic of the neglect of Government to take exception to the conduct of the traversers in detail, and contrasted their quiet acquiescence in the meeting at Donnybrook with their fiery declaration at the intended assembling at Clontarf. He treated this point with great vivacity, and produced general merriment by the manner with which he satirised the indecision and vacuity of the Government at one time, and their sudden vigour and resolution beyond the occasion at another. His next topic was the seditious minstrelsy and inflammatory writings of the *Nation*, which he justified by the pensioned services of Mr. Thomas Moore—by the writings of Taylor, Southey, and Sir Walter Scott himself. In fine, he treated the prosecution as an infringement of the right of free discussion, and wound up one of the most splendid displays of forensic eloquence and learning ever heard within the hall of the Four Courts of Dublin, by an impassioned peroration, in which he dwelt on the constitutional right of the people of Great Britain to meet, discuss, and petition, and adjured the jury to protect that right against the encroachment of prerogative, as the keystone of British liberty. The learned gentleman sat down amidst the expression of loud applause, which the bench could not restrain, and shortly after left the court, and returned home. On his way thither he was loudly cheered whenever recognised.—The court adjourned for a short time at the conclusion of this speech, and when it resumed, Mr. M'Donagh rose in behalf of Mr. Barrett of the *Pilot*. The learned gentleman stated, that he proposed to himself principally to inquire into the amount of *proof* which had been offered by the Crown in support of the indictment. The case might be considered as one of circumstantial evidence, and he was prepared to show that no case had been made out to justify the jury in attributing to his client the guilt of a seditious conspiracy. The court adjourned at five o'clock.

Eighteenth Day.—On Saturday morning Mr. O'Connell shortly addressed the Court, and expressed a hope that he would not be called upon to commence his speech at a late hour of the day. Mr. M'Donagh had not yet finished his observations, and it would probably be some hours before he would have done so. The Court at once intimated its acquiescence in his wishes.—Immediately on this point being arranged, Mr. M'Donagh resumed the line of observation which he had entered upon the previous evening. He commenced with a scrutiny of the evidence given respecting the Baltinglass meeting, and argued upon the improbability of many of the statements made by the policemen, who were the principal witnesses with regard to it. He next adverted to the Clontibret, Tara, and other meetings. His client, Mr. Barrett, had not attended any meeting held in the open air, and his sole crime consisted in having dined two or three times with the Repealers. The speech of Mr. M'Donagh dwelt, perhaps necessarily, so much on the repetition of facts and arguments previously adverted to, that it would be tedious to follow him throughout. He concluded about two, and was followed by Mr. Henn, at the termination of whose speech the Court adjourned.

Nineteenth Day.—On Monday greater anxiety was manifested to witness the proceedings of the trial than on any other since the commencement, from the general knowledge that Mr. O'Connell was to speak. The Court was densely crowded, and ladies were sitting even on the Judges' bench. Mr. O'Connell appeared in plain clothes, having laid aside his wig and gown for the occasion. He began by requesting the patient attention of the Jury while he showed them that he had a right to their favourable verdict. He stood there not his own client alone; he had the Irish people for his clients; he had Ireland to plead for—with her right to constitutional privileges and separate legislation, and his only anxiety was lest the sacred cause should be retarded by anything of which he had been the instrument. He acknowledged that he could not endure the Union. It was based on the grossest insult, and arose from an intolerance of Irish prosperity. They were malefactors who perpetrated the act. All that he had said on this subject he avowed and justified. He felt that he laboured under disadvantages; but this was not the time to discuss how the Jury had been placed in that box. The Attorney-General had only done what the law allowed him. It was certain that there was a great discrepancy between him and them—a discrepancy both religious and political—if it was not so the Jury now before him would not be in that box. But notwithstanding all this, he relied upon their integrity and honesty. He would now pass to the consideration of

the case itself. It was a curious prosecution: it comprehended a mass of matter and embraced incidents scarcely covered by a period of nine or ten months. The memory failed to recall all those circumstances brought in evidence, and the judgment to distinguish what is important from what is not so. It was hard to say what the true question really was. Its entire strength seemed to consist in the cabalistic word "conspiracy." There was a legal definition given of it, which declared it to consist either in seeking what was unlawful, or what was lawful by unlawful means. These were like two hooks to the line; but as to the second branch he could not admit it. Conspiracy was not to be spelt out by casual circumstances. It was admitted by the Crown in this case that there was no private agreement—no secrecy. It was a monstrous thing to call that a conspiracy which everybody knew—which was constituted by an advertisement in the public papers. The learned Gentleman dwelt on this topic at some length, and then proceeded to say that the Attorney-General had disappointed public expectation in not being able to show any facts or incidents connected with this charge, which were not previously perfectly well known. What had become of all that was deep, dark, and dangerous, which it was insinuated would be brought to light on this trial? Where were all the "Gorgons and chimeras dire?" Nothing of the kind was disclosed. The prosecution was, in short, a purely Ministerial one, and the question raised was one between the present Ministers, who were going to enlarge their franchises, and the Whigs who promised much and did very little. And now as to the evidence—what did it bring to light? There was every temptation to men to exaggerate, falsify, or betray; but nothing was betrayed, for the simplest reason in the world, because there was nothing to betray. Would the Jury believe that he had entered into a public conspiracy? He had refused the high office of Master of the Rolls—it was a question if he had not also refused that of Chief Baron—and would the Jury believe that, after this, he could have the cruelty, the folly to enter into a conspiracy of this kind? They could not believe it and must acquit him of it. The learned Gentleman next alluded to the extensive combination which had been formed in England for the purpose of putting down the slave-trade—and asked why was not Wilberforce indicted for conspiracy? The venerable Clarkson was yet alive—why was he not also indicted for conspiracy? He himself had also a share in that conspiracy, and yet nobody presumed to interfere with him. Let the Jury then beware of driving men into corners and the dark—and forcing them into real conspiracies—for that would be the result if they punished such proceedings as these. He asked if Parliamentary Reform or Catholic Emancipation would ever have been carried, if it were not for great meetings and the great agitation which was got up to carry them? On one day they had held their great simultaneous meetings and yet the Attorney-General of the time never thought of turning them into evidence of a conspiracy. Such a proceeding was reserved for the Attorney-General of the present. The Anti-Corn-Law League in England held great meetings and collected money—so did the Anti-Slavery Society—and they had not been prosecuted. And is a precedent for such a proceeding to be sent for to Ireland? In England they are safe in the integrity of the Jury-box—they had an angel-wing protecting them in that tribunal. Now, gentlemen, said Mr. O'Connell, addressing himself to the Jury, will you not protect us as an English Jury protects them? I ask no more—I will be satisfied with no less. The Learned Gentleman next adverted to what he called the machinery of the evidence: it consisted of monster meetings and newspaper publications. With respect to the meetings he did not deny them nor did he deny that they consisted of thousands and tens of thousands of people, but what harm had they done? No person was injured or even frightened by them. The people had been educated and trained by him to such peaceable conduct, and let the verdict on this occasion be what it may, the people will continue to be peaceable. When at length a proclamation was issued against their meeting they immediately obeyed it. Such was the conspiracy—such the conspirators who were now under charge. Their meetings were legal and perfectly suitable to the purpose they had in view. They had never been interfered with till in the last instance. He did not blame the Attorney-General for not prosecuting the persons who joined in them; he did not blame him, for he had no ground for doing so. The Learned Gentleman next commented on the character of the evidence which consisted of publications in the newspapers, and protested against being made responsible for such productions. The Repeal Association had no newspaper organs and gave its sanction to none of them. But besides this, if the newspapers published libels why were not their proprietors made responsible for them? The Learned Gentleman next spoke to his own political text—"The man who commits a crime gives strength to the enemy." He declared himself the founder and the apostle of a new sect whose object it was to effect political changes without violating any law or shedding one drop of human blood. It was a principle of his religion, and if there was any one gentleman in the Jury-box of his persuasion he would know it to be so. His sincerity on this point had never been impugned. He had proved it on many occasions by his denunciation of a dangerous combination among the workmen of Dublin—by his denunciation of the Ribbonmen and all unlawful societies. The Learned Gentleman here travelled over a great many incidents of his political life in proof of this position. In the course of this excursion he glanced at his opposition to the Poor Laws—the evidence of Mr. Bond Hughes (which he highly praised)—his repudiation of American slavery—his refusal of co-operation with the republicans of France—and his respect for Henry the Fifth or whoever might be the legitimate heir to the ancient hereditary monarchy of France; his protest against the Chartists and his having effectually prevented the Irish in England from joining them—and his constant allegiance to the Sovereign. He had come to that time of life when the Queen could do nothing for him, but never had he spoken disrespectfully of her Majesty; if any such expression had been attributed to him he denounced it as a falsehood.

"My energies," said Mr. O'Connell, "have declined, but my ardent love of Ireland remains unabated. What remains of my life I now devote to obtaining a repeal of the Union. I maintain that every Irishman ought to be a Repealer—and before I sit down to-day I expect to make many converts to my opinion. Gentlemen, I now draw to a close, and I recall your attention to the evils of the Union, with a view of showing you how necessary it is that every man should exert himself for its repeal. I ask you would not Repeal cure hideous evils of absenteeism? A high authority, Mr. Hayes of Cork, has calculated the annual drain of rent and surplus revenue at nine millions. The railway commissioners have reduced the sum to six millions. Take this calculation, and I ask will you suffer this hideous drain of six millions annually to continue? The money is raised in the country, but not to fructify in it—not to employ the people—not for the cure of the sick and desolate. It is created from the fertility of the soil and the industry of the people, but not for the benefit of those who earn or raise the money, but to enable others to wallow in wealth who have no connection with Ireland. Sixty millions have been thus drained away in the last six years. Can you, in honour or conscience, encourage a similar drain of the same amount within the next six years? There is a cant that agitation prevents the influx of capital. I ask, does not capital come for profit? but the money we thus get is soon spent, and the burthen of interest is perpetual. We do not want English capital, and this cry is raised by those whose policy, on the one hand, is to drain the country, and on the other hand, to pour in capital through the instrumentality of agents and solicitors, making the poor man still more poor. The surplus revenue varies. In some years it amounts to two millions; last year it was only 700,000*l.*; but whatever the amount, it is drained away, never, never to return. The Woods and Forests draw annually 74,000*l.* in Irish rents, Crown rents, &c. How is this spent? On the Thames Tunnel and the adornment of Trafalgar-square; the greater part on the latter. Now we want in Dublin an additional bridge; we want to remove an oppressive tax from our great thoroughfare. Why should not this 74,000*l.* be spent here? Have we not as good a right as Trafalgar-square? If the Irish Parliament sat in College-green, would this money be sent? Have we no square, no site for ornament in Dublin? I ask, will you vote, I had almost said, for sending away this money, or will you raise your voices in every way in behalf of those who say that Irish money should be spent in Ireland, and that this country should have the benefit of her own resources? Was there no remedy for such a state of things? Yes, there was; and was the man—were those who sought to alter such circumstances to be branded as conspirators—were they to be prosecuted and persecuted because upon public principle they acted for their country's good? Gentlemen, there is not a spot in Ireland more than 30 miles distant from a good harbour—take the map of Ireland—I say there is not a spot more than 30 miles remote from a good harbour; and why is not the country prosperous? Did I not read to you the magical prosperity which followed upon our legislative independence? Did I not read from the writings of men who were adverse to Ireland? Have I not read the evidence of increasing prosperity under our own Parliament? What happened once may happen again. Oh, gentleman, this is a struggle to rescue the poor from their poverty, and to give employment to those who are now unoccupied, to keep the gentry amongst us, for at once their Parliamentary interests would bring them here. An example has been set by the present Ministry in the absentee tax. I leave the case in your hands. I deny I have done anything to stain me. I reject with contempt the appellation of conspirator. I have acted boldly in the open day, in the presence of the magistracy—there has been nothing secret or concealed. I have struggled for the restoration of the Parliament of my native country. Others have succeeded before me; but succeed or fail, it is a struggle to make the fairest land in the world possess those benefits which nature intended she should enjoy."

The hon. and learned Gentleman having closed his speech, which lasted five hours, the Court adjourned.

Twentieth Day.—At the sitting of the Court on Tuesday Mr. Moore, Q.C., stated that a considerable number of witnesses were then in Dublin but, under the circumstances, the counsel for the traversers had come to the conclusion that they would not be warranted in unnecessarily taking up the time of the court to establish that which they considered already sufficiently established. Mr. Conway, proprietor of the *Dublin Evening Post*, was then examined. He stated that in 1810 he was editor of the *Freeman's Journal*, and that in September of that year he attended a public meeting at the Royal Exchange assembled to petition for a repeal of the Union. The then High Sheriff, Sir James Riddal, was in the chair. The Hon. Colonel Talbot and Mr., now Sir Robert, Shaw, father of the present Recorder, were at the meeting. Mr. O'Connell spoke, and the report of his speech as quoted by Mr. Sheil was correct. Another anti-union speech of Mr. O'Connell's was given in evidence from the *Evening Post*, of the 14th January, 1800; also an address to Mr. Grattan, presented to him in 1810, which emanated from the anti-union meeting previously adverted to, and his answer thereto. A similar address to Sir Robert Shaw and his reply were read. The next witness was Mr. James Perry, a Quaker, who was called to show that going to law was against the principles of the Quakers, and that from the year 1696 it was a standing rule in their body to refer all disputes to arbitration. The Attorney-General objected to the reception of this evidence, and was followed by Mr. Warren to the same effect. He contended that the acts of any other body could form no justification for the traversers or the Repeal Association. The Court ruled with the traversers, Mr. Justice Crampton dissenting. They said that the referring of disputes to arbitration was not in itself criminal, that it depended upon the intent, and that they would leave that question to the Jury, allowing the traversers to derive what benefit they might from the mere fact of arbitration being one of the guiding rules of the Society of Friends. The witness then gave evidence. The next witness was Mr. Wm. Cosgrave, who stated that he was secretary to a society called the "Ouzel Galley Club," which consisted principally of mercantile gentlemen, who offered themselves as voluntary arbitrators in all cases where parties disputing were disposed to submit their differences to them. It was an ancient and highly respectable society. All their decisions were made binding by being made a rule of some one of the superior Courts. The next witness was Mr. Charles Vernon, of the Stamp Office, who appeared to prove the publication of certain numbers of the *Freeman's Journal* and other papers. A great deal of time was taken up with reading extracts from these papers. Mr. Morgan, a coachmaker, who was present at the Tullamore Repeal meeting, proved that an arch bearing the inscription, "Ireland, her Parliament, or the world in a blaze," had been torn down by witness and others, in consequence of directions from Mr. Steele, emanating from Mr. O'Connell, who was greatly displeased at its erection. The reading of newspaper extracts was then resumed, and at the conclusion Mr. Moore stated that the case for the defence was closed.

Twenty-first Day.—THE REPLY.—On Wednesday the Solicitor-General addressed the Court and Jury in reply on behalf of the Crown. He must, he said, in the first place, endeavour to divest the case of the mass of obscurity and confusion in which it had been sought to involve it; and of the extraneous matter which had been introduced merely for the purpose of diverting the attention of the Jury from the real question at issue. Eight gentlemen had been heard on the other side, and in their addresses there was an abundance of discrepancies and inconsistencies; but in one respect there was a marvellous consistency in them all—there was not one word in them, from beginning to end, addressed to the real question to be treated. Before applying himself to the details of the case as they had been proved for the Crown, he would advert to those superinduced topics. He would begin with the speech of Mr. Sheil. That learned Gentleman had really thrown the case of his client (Mr. John O'Connell) overboard altogether. He had observed upon the period of time which the Crown had suffered to elapse without instituting any prosecution. But did not this imply that the parties were actually culpable? It was said that they were seduced into crime by the supineness of the Government. That was not the case: they had been warned, over and over again, by the Government against the course which they were pursuing. It was said that this was a prosecution against the people of Ireland, but he said it was a prosecution for them—a prosecution to save them from delusion, and to preserve, not to injure, their rights. The counsel for the traversers had sought to convey to the Jury that privacy and secrecy were necessary constituent parts of the illegal crime of conspiracy, but such was not the fact. It might be carried on in the face of day and in the most public manner, and he gave as an example an unlawful combination amongst workmen, which, while it arose from an unquestionable conspiracy in the eye of law, might yet have been formed in the most public manner. In the present case the conspiracy was necessarily carried on openly, the means were newspapers and multitudinous meetings, and other matter, which were in their very nature of a notorious and open kind, but the conspiracy was not the less real on this account. The learned Gentleman then explained the nature of the charge against the traversers as set forth in the indictment and as it was recognised as a grave offence by law. He said that such was the nature of the conspiracy in which they were alleged to be involved, that peace and tranquillity were most essential to its object and conduct. It was part of the conspiracy that there should be no breach of the peace till their organisation was complete and the proper time for an outbreak should arrive. It was said for the traversers that their meetings did no harm—that they were conducted peaceably and alarmed nobody, but the Jury had yet to learn that a meeting might become unlawful, though conducted in such a way, from the object and purport for which it was intended. It might be impossible to show that any one of these meetings was in itself unlawful; but when circumstances evolve their true purpose their illegality is brought to light, and the taint of unlawfulness extends to every one of them. He next vindicated the law-officers of the Crown from the imputation of having employed improper means in the impannelling of the Jury. He arraigned the temerity of Mr. Sheil's assertion that 10 persons had been struck off the list merely because they were Roman Catholics. They were struck off, he said, because they were members of the Repeal Association. This was the allegation of the Crown Solicitor—and was it denied? Never. Mr. Sheil, indeed, had promised that affidavits should be put in negativing this assertion—put in immediately; but no affidavit had ever been put in from that hour to this. A Jury of Protestants would not, he trusted, now shrink from the performance of their duty by any imputation which might be cast upon them. Reference had been made to a Repeal meeting held in Dublin in 1810, but that was a single isolated meeting, not in itself illegal, and at all events, one which had nothing to do with the present case. The same might be said of a great meeting held at Hillsborough—it was quite a solitary event, and never followed up by other meetings, or any unlawful proceedings whatever. As to Mr. O'Connell's peaceful injunctions and predications of the Repeal agitation, he would beg that the Jury would attach just so much weight to them as his acts might prove them entitled to. He then proceeded to reply to various assertions and arguments adduced by the counsel on the other side, Mr. Moore, Mr. Fitzgibbon, Mr. Whiteside, and others. He remarked that the Crown had not brought forward a single witness to whom the epithet spy or informer could be attached, whilst, on the other hand, the traversers had produced no books, no witnesses, or any other evidence whatever from the bureaux of the Loyal National Repeal Association. Having disposed of all the observations of

the counsel on the other side, the learned Gentleman then entered on his commentary upon the evidence given by the Crown in support of the Attorney-General's original statement. He analysed at great length the doings of the Repeal Association—its signs, passwords, and organisation—the language of the Repeal press—of Mr. O'Connell, and others of the traversers. At 5 o'clock the Solicitor-General intimated that he could not conclude that night, and the Court adjourned.

Twenty-second Day.—The Solicitor-General resumed his argument on Thursday at the sitting of the Court. After referring to the Kilkenny meeting he proceeded to comment on Sir R. Peel's declaration on the subject of Repeal. Mr. Sheil interrupted him, and contended that he was adverting to topics that had not been proved in evidence. Mr. Justice Crampton coincided in this view, and the Attorney-General explained that what he meant to convey was this, that it should be decided by an appeal to a legal tribunal whether the law had been violated or not. He then proceeded to the Arbitration Courts, the corrupting of the soldiery, and the debates of the Repeal Association. He denied the doctrine that the Queen by virtue of the royal prerogative can, independent of Parliament, issue writs for calling together a Parliament in Ireland, and the proposition that the Union is not binding in point of law, both of which he said were unfounded, and based upon unfair and unjust misrepresentations of the opinions of eminent persons. After dwelling in detail on other legal and technical points, the learned Gentleman at 5 o'clock stated that he could not conclude till next day, and the Court adjourned.

Dublin.—The weekly meeting of the Repeal Association was held on Monday in the Conciliation Hall, which was crowded to excess. The chair was taken by Lord Ffrench amidst the greatest applause. His Lordship said amongst other things "that he identified himself heart and soul with Mr. O'Connell." The meeting was addressed by Mr. Maurice O'Connell, M.P., Mr. Dillon Brown, M.P., and Mr. Smith O'Brien, M.P., who moved and carried a resolution to appoint a committee to watch over the proceedings in Parliament. Mr. O'Connell entered the hall during the proceedings and was most vociferously cheered. After the other business was disposed of, Mr. O'Connell handed in some money, and said although he had already spoken something more than five hours he could not refuse to address a few observations to the meeting. They were words of peace. His opinion was that matters were going on as favourably as possible, and inculcated peace as the only means of obtaining the Repeal. He was able to boast in court this day that a single crime had never been committed by an agitator or arising out of agitation. He said the trials would be over in the course of the week, and that the Crown had completely proved his case. They would allow him to reiterate his advice to preserve tranquillity, and he then alluded to the declaration of war by the Government against the Anti-Corn-law League, and had great hopes that good to Ireland would be the result. He trusted they would excuse him as he had already spoken for five hours. Mr. Roche, M.P., then addressed the meeting. He complimented Mr. Smith O'Brien on his speech. He could not allow that opportunity to pass without declaring that he identified himself wholly with the Association. He had no doubt but this agitation would terminate in a national triumph, and concluded by expressing his determination to act on the committee. Mr. O'Connell moved the adjournment of the Association to Monday next, and announced the rent for the week to be 560*l.* 4*s.* 10*d.*

SCOTLAND.

Edinburgh.—The case of Miss Roalfe who was indicted for the sale of blasphemous publications shortly after the conviction of the notorious Patterson has been already noticed in this Paper. She was last week brought up for trial at the Sheriffs' Court, and pleaded not guilty. Evidence having been adduced to prove the purchase of the works referred to in her shop, Miss Roalfe, who conducted her own defence, made a long statement to the court in which she admitted the sale of the works libelled, knowing perfectly that they were calculated to bring religion into contempt, but denied that she sold them wickedly and feloniously. Indeed so little did she consider her conduct criminal, that so soon as she should be at liberty she intended to resume the same practice. The presiding sheriff having found the charge proved sentenced her to 60 days' imprisonment.

Peebles.—A meeting called by the Earl of Wemyss, the Lord Lieutenant of the county, was held in this town on Tuesday, for the purpose of considering what course could be adopted for opposing the progress of the League, and for securing a just protection to the interests of Agriculture. The meeting was well attended by the gentlemen and farmers of that county. The Earl of Traquair was called to the chair, supported by Sir Adam Hay, Bart., Mr. Mackenzie, M.P., Provost Kerr, of Peebles, &c. The several speakers expressed their conviction that protection to Agriculture was absolutely necessary to the labourer, the tenant, and the landlord. Resolutions in accordance with these views were proposed and agreed to unanimously; and a committee was appointed for the purpose of preparing a petition to Parliament in conformity with the resolutions.

Aberdeen.—The local papers state with great regret that the Earl of Kintore has met with another painful bereavement in the death of one of his daughters, a child about 10 years of age, who while amusing herself near the top of the staircase at Keithhall, fell over the ballustrade on the basement floor, a very great height. She was taken up in a state of insensibility, and died in a little more than an hour. This distressing accident, occurring so soon after the sudden death of Lord Inverury, renders the affliction doubly severe.

Law.

COURT OF EXCHEQUER.—*The Attorney-General* v. *Phillips and Others.*—This was an information, at the suit of the Excise, to recover penalties from the defendants for illicit distillation. It appeared from the evidence adduced by the Attorney-General for the prosecution, that in consequence of information received by the officers of the Excise at Norwich, they proceeded with a search-warrant to the farm of the defendants, situated at Swanton Abbott. They made three searches on the premises, one on the 26th June, one on the 27th, and one in September last, when they found various articles which were considered as proof of the offence of illicit distillation having been carried on by the defendants. Among other things found were a quantity of stuff used by distillers in colouring spirits, a copper capable of containing 30 gallons, a cask sunk into the ground but covered over, a sample-drawer which fitted the bunghole of the cask, and an hydrometer, an instrument at all times used in the progress of the distillation of spirits. There were likewise discovered five casks, each holding three gallons, a size never employed by regular distillers, but usually brought into operation in smuggling transactions, upon one of which was stamped the letters H. G. Then there were also three branding-irons found, respectively bearing the letters H. G., C. B., and S. B., denoting Hollands gin, Cognac brandy, and brandy spirit. Upon the premises, too, were found two bottles containing small quantities of brandy, one bottle coloured, the other only spirit. It further was stated by the officers that when they had accidentally discovered the cask, which had been buried in such a position as to lead to the suspicion of its having been used as a "receiver" of the distilled spirit, upon the elder of the defendants being questioned about it, he, in a confused manner, stated that it contained poisonous wash for his sheep. The officers, however, on tasting it found that there was the flavour of molasses, and as they did not undergo any prejudicial effects, the presumption was that the statement of the defendant was untrue. They thereupon seized the implements employed in the operations. Evidence was elicited which went to show that between the 8th March, 1842, and March, 1843, the defendants had purchased about 30 cwt. of molasses. It was further proved that defendants occupied a farm of 80 acres, at a rental of 55*l.* per annum, under the Rev. W. Blake, who stated that the soil was of such a quality, so cold, that it required a great deal of manuring. The case for the Crown having closed, it was suggested, and admitted on all sides, that there was no evidence to implicate John Phillips, one of the defendants, in the illegal transactions, and as to him the Jury, under the Lord Chief Baron's direction, returned a verdict of Not Guilty. Mr. Cockburn addressed the Jury for the other defendants, who stood in the relation of father and son, and called a number of witnesses, whose evidence went to show that about four years since the elder defendant had the copper in question put up in a sort of outhouse, after which it was used for the purposes of brewing, boiling water for the uses of the house, and to scald pigs, in which animals the defendants dealt largely; to boil and steam potatoes, and to make a preparation of molasses, chaff, crushed barley and crushed linseed, which they were in the habit of using to fatten their cattle. It was likewise proved that the cask, or "receiver," as it had been termed by the excise officers, had been sunk in the ground below the flooring of the room about the same period, in consequence of some strong beer having been brewed, it having been deemed prudent to adopt that course with a view to its preservation, as the defendants were without any underground cellar. The sample drawer was stated to have been obtained for drawing up the contents of this particular cask. It did not, however, appear that the cask had been applied to a similar purpose since that period. It was next proved that there was an extremely scanty supply of water, so much so that the defendants' cattle were constantly compelled to be driven as much as three quarters of a mile to water. The stuff which the witnesses for the Crown had said was used for colouring the spirit, the niece stated she had made as a sort of treat for the children and herself. The Attorney-General having replied to the case set up for the defendants, Lord Abinger in summing up advised the jury that they must not find their verdict upon suspicion only. If, however, all the circumstances in the case when put together gave them reasonable ground to believe that the offence imputed had been committed by the defendants, then they could have no hesitation in returning a verdict for the Crown. In their consideration of the evidence the jury would bear in mind a fact which had been urged by the counsel for the defendants — namely, that notwithstanding the three minute searches of the officers, they had not been able to find either worm or top to the copper. That was a circumstance well worthy of consideration, and if they thought there was any weight in it or unless they were satisfied from other parts of the case that those articles must have been got rid of between the visits of the officers, it would doubtless be the duty of the jury to give such benefit as might arise therefrom to the defendants. The plain question was, whether the whole of the evidence and circumstances considered together enabled them to arrive at the conclusion that the offence had or had not been committed by the defendants. If the former, a verdict of guilty must be returned; if the latter, then the parties must be acquitted of the charge imputed to them upon the face of the information. The jury, after some hesitation, returned a verdict for the Crown—Penalties 600*l.*

The Custom House Frauds.—The Attorney-General v. *John Dean.*—This was an information filed by the Attorney-General to recover from defendant certain penalties for having unlawfully and knowingly unshipped 2,000lb. of foreign silk, of the estimated value of 4,233*l.* 12*s.*, and with having knowingly received and harboured the same, without the due payment of duty as prescribed by the Act of Parliament. There were nine counts in the information, each changing and varying the offence, so that whilst the treble penalty on the first count, supposing that count to have been found against defendant, would have amounted to 12,700*l.* 16*s.*, in the event of the verdict being given against him on all the counts, the penalties which he would have been called on to pay would have not been less, as stated by his counsel, than 63,000*l.* The defendant in this instance was Mr. John Dean, who for some time carried on his business in St. Paul's Churchyard, and was in no way connected or associated with the firm of Candy & Dean, whose cases have occupied during the last year or two so much of the public attention. As in the former trials, the "blue book" constituted the pivot upon which the whole of the accusations turned. In the case of the present defendant it was contended, on behalf of the Crown, that the leaves of one "blue book," those purporting to set forth the real contents of the packages in question, had been placed within the cover of the "blue book," which had, in truth, originally contained a correct statement of the articles in the three cases, with the proper amount of duties carried out. After the trial had occupied some hours, counsel for defendant complained that his client had not been made aware of the particulars of the transaction which he was to answer, and that he had not had time to prepare his defence. The Attorney-General then said he would withdraw the record, and let the case stand over till after next term. Lord Abinger concurred, but it being found that the record could not legally be withdrawn it was agreed to withdraw a juror.

BIRTHS.—On 26th Dec., at Florence, the lady of C. MONRO, Esq., of a still-born son.—29th ult., at Dover, the lady of Captain MANNERS, R.N., of a son.—2d inst., at Farningham-hill, Kent, the lady of W. WARING, Esq., of a son.—2d inst., the lady of the Rev. W. J. LANGDALE, of Camden-road-villas, of a son.—3d inst., in Grosvenor-place, Lady MAHON, of a daughter.—4th inst., in Chester-street, the lady of G. CAMPBELL, Esq., of a son.—4th inst., at 13, Cavendish-square, the lady of E. MARJORIBANKS, jun., Esq., of a son.—5th inst., at 17, Park-crescent, the lady of W. FORSYTH, Esq., Barrister, of a daughter.—6th inst., at Russell-farm, Herts, Mrs. CHARLES PEARSE, of a daughter.—6th inst., at 21, Banks-town, Sheerness, the lady of J. R. SUTTRITT, Esq., surgeon, of a son still-born.

MARRIED.—On 31st ult., at Duncan-terrace, Islington, FLORA, elder daughter of the late Mr. A. Henry, to Mr. JULIUS VALENTI, of Highbury.—1st inst., at St. George's, Hanover-square, the Rev. RICHARD GWILLYM, M.A., incumbent of Ulverstone, only son of the late Richard Gwillym, Esq., of Bewsey, Lancashire, to SARAH, third daughter of the late T. Strickland, Esq., of Reydon-hall, Suffolk, and relict of the late R. Childs, Esq.—1st inst., at Titchfield, Hants, the Hon. Sir E. BUTLER, son of the Right Hon. Lord Dunboyne, to URANIA ELIZABETH, daughter of the late Vice-Admiral the Right Hon. Lord Henry Paulet, K.C.B.—2d inst., at All Souls' Church, Langham-place, CHARLES FAREBROTHER, Esq., S.C.L., of Trinity College, Oxford, eldest son of Alderman Farebrother, of the Moathouse, Stockwell, Surrey, to EMILY SOPHIA, second daughter of the Rev. J. H. Hughes, M.A., of Trinity and All Souls Colleges, and rector of St. Clement's, Oxford.—2d inst., M. FERDINAND HACAULT, of the Ministry of Public Works at Brussels, to CATHERINE, second daughter of the late R. Gilbert, Esq.—6th inst., at St. Mary's, Reading, Mr. M. H. SUTTON, of the Market-place, Seedsman, to CHARLOTTE, youngest daughter of Mr. Jas. Trendell, Goldsmith, of Minster-street.

DIED.—On 3d Nov., 1843, at the Cape of Good Hope, CHARLES, third son of the Rev. C. H. Hallett, of Higham, Kent.—30th ult., at his residence, Camden-cottages, Camden Town, J. ADDISON, musician and composer, aged 79.—29th ult., at the vicarage, Pembury, the Rev. S. WOODGATE, fourth son of the late W. Woodgate, Esq., of Somerhill, in the county of Kent.—28th ult., at her residence in the Royal Crescent, Cheltenham, MARIA, relict of the Rev. C. Jarvis, late Incumbent of Cheltenham.—Lately, at Haslar Hospital, Lieut. A. S. WRIGHT, R.N., son of Rear-Admiral Wright, and grandson of the late Admiral Schank, of Barton House, Dawlish.—26th ult., at Stoke Fleming, near Dartmouth, GEORGE GRAHAM, Esq., formerly of New Bridge-street, London, aged 73.—26th ult., in London, GEORGE LISTER, Esq., in a deep decline, aged 28.—Mr. HENRY RIMELL, of 56, New Bond-street, aged 58.—15th ult., at the residence of her uncle, Captain Robert Riddell Carre, R.N., 12, Howe-street, Edinburgh, ELIZABETH CARRE RIDDELL, second daughter of the late T. Riddell, Esq., younger, of Camiestown, Roxburghshire.—13th ult., at Venice, LEWES GARLAND, Esq., eldest son of the late Peak Garland, Esq., of Sandridge Lodge, Wilts.—7th inst., aged 81, J. HARMAN, Esq., of Old Broad-street, and Highamhouse, Woodford.—5th inst., at Norwich, Mrs. ELIZABETH FITT, aged 76.—3d inst., at Kilfane, Sir JOHN POWER, Bart., aged 76.

GAZETTE OF THE WEEK.

BANKRUPTS.—H. TISOE, Hertford, carpenter—F. HILLAM, Cambridge terrace, Edgware Road, ale-merchant—N. T. SMITH, jun., Lime-street, London, ship-owner—T. LANGRIDGE, Tonbridge Wells, Kent, auctioneer—T. WEBB, Regent-street, Marylebone, lace-dealer—R. HOSE, Garnault-place, Spa-fields, stationer—J. HARDLEY, Newport, Isle of Wight, miller—C. SUTTON, Southampton, grocer—M. OGSTON, Davies-street, Berkeley-sqr., watchmaker—J. MOORE, Tamworth, Warwickshire, draper—T. GREGORY, Poulshot, Wiltshire, miller—C. REEBY, Stamford, Lincolnshire, miller—R. CHAPMAN, Scorton, Yorkshire, inkeeper—J. and G. EWART, Newcastle-upon-Tyne, auctioneers—G. WALTON, Stockton-on-Tees, wine-merchant — S. BILLINGTON, Birkenhead, Cheshire, woollen-draper—M. TILDESLEY, Porto Bello, Staffordshire, timber-dealer—E. MINISTER, Argyll-place, Regent-st., tailor—F. J. SCOTT, St. Alban's, apothecary—J. HETHERINGTON, H. DOCKER, and C. JOHNSON, Quadrant, Regent-st., lamp-dealers—C. TRESDALE, and R. TOULSON, Westminster Bridge-road, furnishing warehousemen—S. W. LEONARD, Frances-st., Golden-sq., butcher—W. LEWIS, Bristol, carpenter—J. ALDRED, Nottingham, wholesale stationer.

SCOTCH SEQUESTRATIONS.—R. P. M'BRAIR and JOHNSTONE, Glasgow, ship-owners—A. OPPENHEIM, Edinburgh, auctioneer—R. KERR, Thorn Hill, Dumfriesshire, tanner—G. F. ROBERTSON, Greenock, merchant—J. WILSON, Glasgow, baker—C. M'ALPINE, Glasgow, ship and anchor smith—J. HOUSTON, Midton, Cragie, horse and cattle-dealer.

WANTED.—An Active, Industrious Farming Bailiff, who can bring unexceptionable references as to character from his last Situation, and thoroughly understands his business in all its branches. The Farm which he will be required to superintend is about 200 acres, three-fourths of which are Grass Land; therefore he must have a great knowledge of the Rearing, Management, and Selection of Stock, and of the Improvements in the use of Manures. He must be a married man, without incumbrance, and his wife will be required to take the charge of the Dairy and Poultry, to the care of which she must have been previously accustomed. A Scotchman would be preferred.—Direct, post paid, to H. V., Post Office, Hertford.

WANTED, a young or middle-aged Man, as PROPAGATOR in an Establishment in the neighbourhood of London, where nothing but pot plants are grown. He must thoroughly understand his business in all its branches.—Apply, by letter (post-paid), to A. B., 19, Milk-street, City, stating where he has lived in that capacity.

WANTED immediately, a Farming Man and his Wife, of unexceptionable character, between 35 and 45 years of age, without incumbrance, to take charge of a small cottage and garden. 12*s.* a week will be given, rent and taxes free, and firing six months in the year, when the family is down.—Apply personally, to R. G., 37, Cornhill, London.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A married Man, aged 40, who understands Kitchen Gardening, Pleasure Grounds, and Forcing. Can have a good character.—Direct to A. B., Post-office, Welling, Bexley, Kent.

AS GARDENER.—A married man, 33 years of age, a native of Scotland, who is perfectly acquainted with every branch of his profession, on the most approved principles, and can be well recommended by a Nobleman with whom he has lived about 4½ years. Direct A. W., at Messrs. Ronald's Nursery, New Brentford, Middlesex.

AS GARDENER.—An unmarried Man, aged 25, who has a perfect knowledge of his business, and can be well recommended from his last situation.—Direct to W. W. J., Post-office, Little Chelsea.

AS GARDENER, where one or more men are kept.—A young Man, aged 35, who perfectly understands Forcing, Kitchen, Fruit, and Flower Gardening, and has a Practical knowledge of the cultivation of Plants; has no objection to take charge of land, and can have an unexceptionable character from the Gentleman he has lived with 4½ years.—Direct to W. Y., at Mr. PAMPLIN'S Nursery, Hornsey-road, Islington.

AS GARDENER.—A single Man, aged 26, of industrious and persevering habits, and practically acquainted with Hothouse, Greenhouse, Kitchen, Fruit, and Flower-Garden. His character will bear the strictest inquiry for capability and general good conduct.—Direct to E. D., at Mr. Robinson's, 39, Great Russell-street, Bloomsbury.

AS GARDENER.—A single young Man, who can have a good character from his last Situation. Direct R. S. T., at Mr. JOHNSON'S, 21, Mary-street, Regent's Park.

A YOUNG MAN, 23 years of age, who has been brought up in the Nursery business, is desirous of obtaining a Situation in a SEED-SHOP in London. Respectable reference and security can be given.—Direct to A. M., *Gardeners' Chronicle and Agricultural Gazette* Office.

A YOUNG MAN who thoroughly understands Painting and Glazing, and has no objection to assist and fill up his time working in the Garden.—Direct to A. R., Mr. Harding, Grocer, Acton, Middlesex.

Mrs. Ricardo, the Volumes from 1835 to 1840, inclusive
The Duke of Leinster, the vols. from 1835 to 1843, inclusive

JOHN CATTELL, Seed and Nurseryman, Westerham, Kent, begs to call the attention of the Public to his Superior Stock of Seeds, Trees, and Plants. Separate Catalogues of which are now ready. Standard and Dwarf Pansies remarkably fine, Bedded plants of the newest and best sorts of Strawberries. A good stock of the New Improved Autumn Raspberry, "Rodger's Victoria," warranted true at 3*s*. 6*d*. per dozen, 25*s*. per 100. A few good plants of Veronica speciosa. Seeds carefully packed for exportation.

J. C. is in want of a few hundreds of seedling Azalea pontica, single stemmed plants, about the size of a common pen-quill, a plant or two of which as sample, may be forwarded, with price and quantity per Post.

NEW DAHLIA, "SYRED'S HERO OF MAIDA."

Colour, bright orange; well cupped, and very constant, strong robust habit, adapted for a back-row flower; and where colour is predominant in class-showing it is superior to any orange yet out. Having been raised by an Amateur it was only exhibited for competition at Hammersmith, where it obtained the first Seedling prize, and at Stockwell Seedling Show, where it also obtained a prize.

Daniel Syred, Nurseryman, Blomfield-road, Maida-hill, Paddington, having purchased the stock of the above fine Dahlia, he has a few ground-roots left to spare, at 3*l*. each, and strong pot-roots at 1*l*. 10*s*. each. Plants 1st May, 10*s*. 6*d*. each. The usual discount to the Trade. No objection to exchange roots or plants for any approved variety.—London, Feb. 16, 1844.

R. WHITE & Co.'s Collection of Plants, of which a Catalogue is now ready, comprise every variety of Geranium, Fuchsia, Verbena, Chrysanthemum, Dahlia, &c. which is worthy of cultivation. The following collections are offered, the selection being left to the purchaser :—

			l.	*s*.	*d*.
40 first-rate varieties of	Geranium		5	0	0
20 ,, ,,	do.		3	0	0
12 ,, ,,	New do.		3	0	0
20 ,, ,,	Fuchsia		1	1	0
40 ,, ,,	Chrysanthemum		1	1	0
20 ,, ,,	Verbena, including Seedlings which were submitted to Dr. Lindley for his opinion, and reported to be "all very fine," see *Gardeners' Chronicle*, Sept. 30th and Oct. 7th: "*Alfred* : All your Seedling Verbenas are good flowers."		1	1	0
12 first-rate Dahlias			1	1	0
100 fine show do.			2	10	0

The above will be ready for delivery in strong plants the first weeks of April and May; and orders containing remittances will be executed in strict priority. Orders amounting to 5*l*. will be delivered free.

Agents for the sale of Stephenson's Conical Boiler, Tank, &c., which may be seen at work, and can be supplied at Manufacturers' prices. Also Whitney's Composition Substitute for Glass.—Poole Nursery.

NEW AND SUPERB COLLECTION OF SEEDLING FUCHSIAS.

W. J. EPPS begs to announce that he purposes sending out, on the first week in March, Ten Magnificent Seedling Fuchsias, which have merited high opinions from the most distinguished judges of the day. They are very distinct, and possess the finest properties of any Fuchsias yet known.

BRIDEGROOM (Epps').—A fine flower, of great size and splendour, light pink tube, sepals very smooth and rich, beautifully tipped with green, corolla very large, of a deep vermilion colour, very like Chandlerii, but twice the size; of a splendid erect habit, and a very free bloomer.—(This was submitted to the Editor of the *Florist's Journal* in November last. See Answers to Correspondents. Price 5*s*.

ESPARTERO (Epps').—This flower is of large size, tube long, bright scarlet, short sepals, expanding well, and exhibiting an extraordinary large deep rich rosy-purple corolla, immense bloomer, and a very distinct variety.—(See Mr. Ayres' opinion, *Gardeners' Chronicle*, *Nov.* 25, 1843, on the article of Fuchsias. Price 7*s*. 6*d*.

KENTISH HERO.—*A fine flower*, of a beautiful vermilion red tube, and sepals well expanded, exhibiting a splendid puce-purple corolla of great substance, very distinct; fine compact habit. Price 5*s*.

DUKE OF WELLINGTON.—*An immense flower*, of great substance, very rich rosy pink tube, and sepals beautifully smooth and slightly tipped with green, very large corolla, of a rich rosy crimson, sepals expand well, almost reflex; fine free habit. Price 5*s*.

WINSERII.—(Professor Lindley's opinion, see *Gardeners' Chronicle*, *Aug.* 5, 1843, to Correspondent, *J. W.*, *Tenterden*.) Price 5*s*.

"No. 1, tube long and smooth, of a rosy crimson, sepals open very wide, with the points slightly tipped with green, corolla short, of a rosy vermilion colour; *a fine variety*."—Professor Lindley.

MARIA.—"No. 3, tube and sepals rose coloured and smooth, corolla large, of a fine bright blue purple; *an elegant variety*."—Professor Lindley. Price 5*s*.

FLORENCE.—"No. 6, tube smooth, sepals spreading, rosy in colour, with the points slightly tipped with green, corolla rosy purple; *very pretty flower*."—Professor Lindley. Price 5*s*.

"All these seedlings are good in form, bright in colour, and smooth in texture."—Professor Lindley.

KENTISH BRIDE.—This magnificent flower was raised by H. Busby, gardener to T. L. Hodges, Esq., Hemsted, Kent, and has merited the high opinion of Professor Lindley, Editor of the *Gardeners' Chronicle*; Mr. G. Glenny, Editor of the *Gardeners' Gazette*; and Mr. Ayres, the able writer on the Amateur's Garden. Price 7*s*. 6*d*.

Professor Lindley's opinion, see *Gardeners' Chron.*, July, 8, 1843, to correspondent, *H. B.*—"Your best Seedling Fuchsia is No. 4. This is a beautiful variety, seed-vessels bright green, tube and sepals bright rosy scarlet, corolla large, of a bright violet purple. It is a well-proportioned flower."

Mr. Ayres' opinion, see *Gardeners' Chronicle*, Nov. 25, 1843.

Mr. G. Glenny's opinion, see *Gardeners' Gazette*, Oct. 21, 1843, to correspondent, W. J. E.—Fuchsia,—"Pink sepals, rich purple corolla, long footstalk. If the habit of the plant be as good as the flower, it is an acquisition."

The habit of this plant is very compact, and of a beautiful rich green glossy foliage, and with its rich pink tube, sepals, and blue purple velvet corolla, forms a lovely object.

EMPEROR OF CHINA.—This is a fine flowe rraised by the same person as Kentish Bride, and submitted to Professor Lindley at the same time. Price 5*s*. "No 1, which is similar to No. 2, and having a stout tube. This is a fine flower, with less blue in the corolla."—Professor Lindley.

PRINCE OF WALES.—This also was raised by H. Busby, and submitted to Professor Lindley with two others. *An immense Bloomer*. Price 5*s*. "No. 3 is a stout flower of a good colour, with long sepals, which expand freely and expose the corolla, which is of a rosy purple."—Professor Lindley.

*** The Collection, Two Guineas and a half. A remittance from unknown Correspondents. The usual allowance to the Trade where two or more plants are taken.

Bower Nursery, Maidstone, *Feb.* 1*st*, 1844.

GAINES'S NEW AND FIRST-RATE PELARGONIUMS now ready for delivery, in strong, healthy Plants. The following are a few selected :—Gaines's Elegans nova, King of Beauties, Ackbar, Lady Prudhoe, Saxon King, Excelsa, Beauty Supreme, Mogul, Edith, Countess of Zetland, Cotherstone, Egbert. A list of Pelargoniums, Pansies, Calceolarias, Fuchsias, Verbenas, Auriculas, Cinerarias, Chrysanthemums, Dahlias, &c., which contains many new Seedlings of first-rate qualities; plants in May, 10*s*. 6*d*.; also a few roots of his Seedling Dahlias Princess Alice and Twickenham Rival are still to be disposed of at the Nursery, Surrey-lane, Battersea.

H. MAJOR, Knosthorpe, near Leeds, begs to say that a descriptive List of his New Shrubby CALCEOLARIAS, together with a select List of PANSIES and DAHLIAS, is now ready, and may be had on postpaid application. Mr. M. offers the whole on terms worthy the notice of his friends.

A few packets of select Pansy Seed, saved from sorts possessing well-marked eyes, may be had at 2*s*. 6*d*. per packet. Small packets of very select Calceolaria Seed, saved from Mr. M.'s own seedlings, 2*s*. 6*d*. per packet.

DANE CROFT NURSERY, STOWMARKET, SUFFOLK.

SAMUEL GIRLING, English and Foreign Dahlia Agent, submits the following choice SEEDLING DAHLIAS to his numerous Friends for 1844, plants of which can be had early in May; they are all faithfully described, and early orders are respectfully solicited, as the stock of some of them is very limited. General Catalogues of DAHLIAS, GERANIUMS, PANSIES, FUCHSIAS, and VERBENAS, can shortly be had, on prepaid application.

BEAUTY OF SUFFOLK (Barr's).—Bronzy purple, of superior form and excellent habit; a constant and extra second-rate show-flower; seedling prizes at Ipswich and Stowmarket. Height 4 feet.—Price 7*s*. 6*d*.

BERMONDSEY BEE (Proctor's).—A crimson purple, of excellent form and fine general habit, well cupped, stiff petals; when well grown one of the best Self Dahlias in cultivation.—4 ft.—10*s*. 6*d*.

MODEL (Bourn's).—Dark purple, of first-rate form; has taken first prizes at the Metropolitan and other shows, and pronounced a first-class flower. 4 ft.—10*s*. 6*d*.

NONPAREIL (Proctor's).—Ruby scarlet, of first-rate form, habit excellent, free bloomer; pronounced by the Horticultural Society of London, and at the Slough exhibition, to be a first-class flower. The stock of this beautiful Dahlia is small, and unless it breaks well will be held in another year. No allowance on this variety unless six plants are ordered. Glenny's opinion of this Dahlia is, that well-grown it will be a trimmer. 4 ft.—10*s*. 6*d*.

ORANGE PERFECTION (Bourn's).—Of good form and habit, an extra second-rate show-flower, rather low in the centre, but sometimes well up, when it will beat all the orange class. 4 to 5 ft.—7*s*. 6*d*.

RED ROVER (Girling's).—Of good general properties and extra fine habit; colour fine red, and useful for showing. 4 to 5 ft.—7*s*. 6*d*.

TALMA (Girling's).—Purplish rose, of superior form and habit, little short of first-rate; rising centre and very constant. 4 ft.—7*s*. 6*d*.

SIR JOHN STEWART RICHARDSON (Union, in which S. G. has a share), which is one of the most popular Dahlias of the season. No allowance on this variety unless 12 plants are ordered. 4 ft.—10*s*. 6*d*.

FANCY DAHLIAS.

CORNELIA (Girling's).—Purple, tipped with white; of good habit and very distinct. 4 ft.—5*s*.

GARLAND (Girling's).—With three colours—cream, sulphur, and brown tip; of good form and habit. 5 ft.—5*s*.

MADAME MIELLEZ (Girling's).—Rose-lilac, tipped or striped with white; a distinct variety, of good habit. 3 to 4 ft.—5*s*.

MADAME DE BERGHE (Girling's).—White edged with pink; a distinct and beautiful variety. 3 ft.—5*s*.

MADAME CHAUVIERE (Girling's).—Light crimson tipped with pure white; very constant, good shape, and one of the finest border Dahlias in cultivation. 4 ft.—5*s*.

VILLAGE MAID (Girling's).—Colours white and purple, distinctly and beautifully tipped; good habit, and superior border variety. 3 to 4 ft.—5*s*.—Stowmarket, Feb. 16, 1844.

JAMES DICKSON & SONS, Nursery Seedsmen and Florists, in returning their sincere thanks for the liberal patronage they have hitherto enjoyed from the Nobility, Gentry, and Public at large, both in this Country, England, and Ireland, beg respectfully to intimate that they have received their Full Supply of SEEDS, in fine condition, for SPRING SOWING, of first-rate quality.

From the arrangements they have recently made with some of the first Growers, their Customers may depend on receiving Fresh Seeds of all descriptions, carefully selected for J. D. and Sons' Sales.

J. D. & Sons beg to call the attention of their Friends to their Stock of EVERGREENS, FRUIT and FOREST TREES, in their Nurseries of Inverleith and Broughton Park, which will be found equal in quality and extent to any in Scotland.

J. D. & Sons beg further respectfully to intimate that they have considerably extended the Floral Branch of their Business; and they assure their numerous Customers and the Public at large that no pains or expense will be spared by which the efficiency of every department of the concern shall be secured, so as to ensure a first-rate article at the lowest figure.

Catalogues of every article connected with their trade have just been published, and can be forwarded, per post, on the receipt of postage stamps to the amount of sixpence.

N.B.—Noblemen and Gentlemen provided with experienced Gardeners, Land Stewards, and Wood Foresters, whose character and abilities may be depended on.—32, South Hanover-street, Edinburgh, February 16, 1844.

GENUINE BEECHWOOD MELON SEED.

R. GLENDINNING respectfully begs to inform the Cultivators of the MELON that he has had presented to him by Sir John S. Sebright, Bart., Seeds of the *true* variety of his delicious MELON; for besides being one of the very best sorts known, it is of easy cultivation and a good bearer. This opportunity will enable gentlemen to procure it *quite genuine*, which is rarely the case, as the following note will testify :—

"Beechwood, Feb. 5, 1844.

"Sir,—I send you a small parcel of the Beechwood Melon Seed. None that I have seen exhibited under that name, nor any that I have seen grown from Seed that has been bought, are of the true sort, but have obviously been intermixed with other varieties. I have grown no other for many years.

"Your obedient servant,

"To Mr. Glendinning. "J. S. Sebright."

R. G. has also a few Seeds of the true SION FREE-BEARING CUCUMBER, a splendid variety which has been nearly lost.

Packets of the above sent by post free.

Beechwood Melon, per packet . . . 5*s*.
Sion Free-bearing Cucumber, per packet . 5*s*.

R. G.'s Kitchen-garden and Flower-Seeds have been selected with great care, and embrace all the new and good kinds.

Chiswick Nursery, near London, Feb. 16, 1844.

JOHN MILLER, surviving Partner of the late firm of Sweets and Miller, Nursery and Seedsmen, Bristol, begs respectfully to inform Nurserymen, the Trade, and his Friends in general, that he has commenced business as Auctioneer and Valuer of Horticultural and Agricultural Stock, &c., and hopes by strict attention to the interest of his employers, to merit their support. Letters addressed to John Miller, Portland House, Kingsdown, Bristol, will meet with immediate attention.—Bristol, February 16, 1844.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Æsculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chesnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which appeared in the *Gardeners' Chronicle*, Oct. 21 and 28.)

Nurseries, Clapham, near London, Feb. 16, 1844.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK-EYED VISCARIA.

T. AND J. BACKHOUSE, Nursery and Seedsmen, York, have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10), of the "Botanical Register" for 1843. The blossoms are of a bright rose colour, with a deep crimson eye, and changing to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers and may be sown either in the open ground in spring, or raised on pots and planted out.

Packets, 2*s.* 6*d.* each, will be sent, on the receipt of a Post-office order, postage free, to any part of the Kingdom.

SPLENDID NEW SEEDLING CINERARIAS.—Fine early-flowering strong plants of CINERARIAS, saved from the very choicest sorts of blue and crimson colours, selected from between five and six thousand Seedlings of last year. Those purchasing will have an opportunity of flowering some of the choicest sorts in cultivation, remarkably healthy, and having a large stock they can be sold at 9*s.* and 12*s.* per dozen, carefully packed for any part of the country. Applications including Post-office orders will be immediately executed. Large bunches of RUSSIAN VIOLETS in full flower, fit for potting, 6*s.* and 9*s.* per doz.—Direct to Michael Brewer, Sen., Cambridge Nursery.

GREAT YARMOUTH NURSERY, NORFOLK.—1844.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; and NURSERYMEN and FLORISTS by Special Appointment to HER MAJESTY THE QUEEN DOWAGER.

A SELECT CATALOGUE of the Newest and very best varieties of FUCHSIAS, VERBENAS, PETUNIAS, and ANAGALLIS, offered by YOUELL & Co.

Youell & Co., in submitting their Catalogue of Fuchsias for 1844, take the present opportunity of drawing the attention of admirers of the above elegant tribe of Plants, to their select and superb Collection. They have spared no expense in forming a Selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attended their mode of selection last season, collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the Kingdom.

Youell and Co. being the parties who first sent out per post, with safety, these tribes of Plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine Vars.	.	12*s.*, the Selection left to Youell & Co.
12 Ditto do.	.	21*s.*, the Selection left to the Purchaser.
50 Fine Varieties	.	40*s.*, the Selection left to Youell & Co.
50 Extra Fine ditto	.	60*s.*, the Selection left to the Purchaser.

[With the exception of those marked thus.*]

The Plants will be strong and healthy, and ready for delivery by the latter end of March, with the exception of those marked thus* (which will be ready in April), thus ensuring to the Purchaser fine Plants for competition in the ensuing season. Many of the Varieties can be supplied now.

NEW AND SPLENDID SEEDLING FUCHSIAS.

* "Fuchsia Lindleyana." This brilliant Fuchsia, the entire Stock of which is in the possession of Youell and Co., is now for the first time offered to the notice of the Public.

Its exceeding large Tube and Sepals are of the most vivid Vermilion and excessively expansive, surpassing in brilliancy any hybrid that has yet been raised. It was exhibited at the London Horticultural Society's Meeting, Regent Street, and greatly admired, and was pronounced by all who saw Youell and Co.'s specimen plant, to be the most dazzling object of this tribe, they ever witnessed. The foliage and habit exceedingly fine, a most abundant bloomer, and will be found a desideratum to every collection. Plants will be ready for delivery by the first week in April, at 7*s.* 6*d.* per plant. Usual discount to the trade, when not less than six plants are ordered.

YOUELL & CO., in calling the notice of Amateurs and others to the following seedling Fuchsias, raised in their Nursery, beg to state, that in the summer of 1842 they bestowed every care in hybridising the best varieties in cultivation, from which they succeeded in raising upwards of 3000 plants, to the flowering of which one house was entirely devoted last year. And although many varieties, possessing superior claims to the attention of those cultivating this elegant tribe, were submitted for the opinion of Dr. Lindley, and most favourably noticed, yet Youell and Co. feel that in making a selection of the following six varieties, to which a most accurate description is affixed, will prove not only satisfactory to the purchaser, but to themselves.

These will be ready for delivery in April next, and as the stock is very limited early orders are solicited.

* "Queen Victoria." Tube and sepals smooth, of a bright vermillion; corolla stout, long, of a fine purple rose-colour, forming a good contrast, and of fine texture. Price 7*s.* 6*d.* per plant.

* "Prince of Wales." Tube and sepals rosy vermillion, the latter tipped with green, expanding well, and showing a fine corolla of maroon purple. Price 7*s.* 6*d.* per plant.

* "Princess Royal." Tube and sepals bright red; corolla large and peculiarly bright in colour. Price 5*s.* per plant.

* "Marchioness of Normanby." This is a large and showy flower, measuring four inches from the commencement of the pod to the termination of the pistil; tube and sepals scarlet; corolla stout, having a tinge of purple on it. 7*s.* 6*d.* per plant.

* "Lady Alice Peel." A flower of good form and substance; fine rosy red tube and sepals, the latter terminating in a decided green; corolla very large and stout, of a beautiful crimson purple. Price 5*s.* per plant.

* "Lady Walsingham." Tube and sepals smooth, of a rosy vermilion, the latter turn up and expose the whole of the corolla, which is stout, and of a fine purple crimson. Price 5*s.* per plant.

When the six are ordered, they will be charged 1*l.* 11*s.* 6*d.* the set.

[With every other new variety worthy of cultivation, that may be advertised by other parties, after the publication of this list.]

Youell & Co. are preparing a short Treatise upon their successful mode of Cultivating the Fuchsia, and will be presented *Gratis* to Purchasers.

VERBENAS.

* "Monarch," (Youell's.) Is a delicate creamy white, surpassing in its size and fragrance every other variety; the tufts of bloom measuring from 3½ to 4 inches diameter, and will be sure to give satisfaction. Price 5*s.* per plant.

* "Brilliant," (Youell's.) This fine variety is of the most vivid scarlet, equal in this respect to "Melindris," the bloom, however, is three times the size, and very fragrant, and will prove most desirable in any collection. Price 3*s.* 6*d.* per plant.

* "Elegans," (Youell's.) Is a most interesting variety, being a delicate lilac, with a distinct white eye; flower large and fragrant. Price 3*s.* 6*d.* per plant.

* "Surprise," (Youell's.) Can be recommended, being a variety completely novel, and one that must be cultivated in every collection, the colour being of the richest rosy crimson, or ruby, producing tufts of flowers of 3½ inches in diameter, and delightfully fragrant. Price 5*s.* per plant.

The above four varieties have been selected from upwards of two thousand seedlings, and may be confidently relied upon as possessing superior claims, and will be sure to give satisfaction; will be ready to send out in April next, (post free.) If the four varieties are taken, they will be charged 15*s.* the set.

N.B.—Foreign Orders promptly executed, and packed securely by parties of many years' experience, thus ensuring their secure transmission.

For Particulars of YOUELL'S CELEBRATED "FASTOLFF RASPBERRY," patronised by Her Most Gracious Majesty the Queen, and most of the Nobility, see their Advertisement of the 10th inst. Also

YOUELL'S TOBOLSK RHUBARB,
TWO SPLENDID SEEDLING PICOTEES,
FINEST CARNATIONS AND PICOTEES,
All of which are now ready for sending out.

ARAUCARIA IMBRICATA.

YOUELL AND CO., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*l.* per 100, or 30*s.* per dozen.

Fine Plants of CEDRUS DEODARA 2 ft. to 2ft. 8 ins., 10*s.* 6*d.* each

FUCHSIA SEED.

YOUELL AND CO. beg to inform their Friends and the Public they have succeeded in saving a small quantity of the above from the very newest and best varieties, which they offer upon the following terms:—

A packet containing 100 seeds 10*s.*
Do. do. 50 do. 6*s.*

Sent Post Free on the receipt of a Post-office order. Directions for sowing, &c. will accompany each packet.

This will form an admirable opportunity to those who intend competing for Seedling Prizes at the exhibitions of the present year. The quantities being very limited, early application will be necessary.—Great Yarmouth Nursery, Feb. 8, 1844.

JOHN HANCOCK AND SON, Nurserymen, Durham, beg to call the attention of their friends to the following, of which they can supply plants of fine quality:—

"Fuchsia Lowryii," which they sent out in a very limited number in the autumn, in consequence of not being able to supply the orders received. They beg to submit the following extract, abridged from the Gardening article of the *Sunderland Times* newspaper:—

"We have seen Fuchsia Lowryii a few days ago, and were much struck with the beauty of its general habit, profuse, rich, and elegant blooms. If it has one property more to be commended than another, it is its very bright colours, which are as rich as it is possible to conceive, and very vivid. Its foliage resembles Globosa, only prettier; it blooms freely on small plants distinct from the foliage. The flowers are much larger than any of the older varieties; the tube and sepals are of a fine clear crimson, which open freely, and reflex so as to display the whole of the large corolla, which is of a very bright dark blue, tinged towards the bottom to a deep purple; it cannot fail to be a general favourite with the admirers of the Fuchsia."

J. H. & Son feel confident that this will prove one of the finest varieties ever sent out. Strong Plants will be sent by post at 7*s.* 6*d.* each, carefully packed in tin cases.

Fuchsias—Brockmanii, Balooniflora, Cormackii, Champion (Smith's), Britannia (Smith's), Defiance (Smith's), Exoniensis, Eppsii, Dennisiana, Fairy Queen, Gem (Ivery's), Iveryana, Lanei, majestica multiflora (Knight's), multiflora coccinea (Knight's), majestica (Smith's), noblissima (Smith's), Paragon (Smith's), Rogersiana, St. Clare, Stanwelliana, Swalesii, Toddiana. Fine strong healthy Plants will be ready by 1st March, and can be sent by post if the plants are not required to be too large.

Geraniums.—Constellation (Garth's), Count D'Orsay (Wilson's), Duchess of Sutherland (Gaines'), Lady Webster (Denyer's), Northern Beauty (Hancock's, fine), Nestor (Foster's), Oberon (Hodges'), Prince of Wales (Gaines'), Sir R. Peel (Foster's), Sunrise (Lyne's), Beauty of Essex (Wilson's), at 10*s.* 6*d.* each; Rising Sun, Queen of the Fairies, Wonder (Garth's), Vanguard (Gaines'), at 5*s.* each. Fine plants of the above, at 3*l.* 10*s.* per doz. Anna (Wilson), Alice Gray (Wilson's), Camilla (Wilson's), Duchess of Kent (Gaines'), Enchantress (Wilson's), Evadne (Garth's), Flash (Garth's), Grand Monarch, Gipsy (Foster's), Glory of Jersey, Jubilee (Garth's), Lady C. Shepherd, Madeline (Lumsden's), Medora (Foster's), Prince of Waterloo, Princess Sophia Matilda, Van Amburgh (Wilson's), Witch (Garth's). Very strong and healthy plants at 30*s.* per dozen.

Gesneria alba, 3*s.* 6*d.*; Manettia bicolor, 3*s.* 6*d.* (fine); Syphocampilus betulæfolia, 2*s.* 6*d.*; Bridgesia spicata, 3*s.* 6*d.*; with many other new Greenhouse Plants.

General Descriptive Catalogues of Geraniums, Camellias, Fuchsias, Pansies, Verbenas, Cinerarias, Greenhouse and Herbaceous Plants, may be had, on application, by sending two postage-stamps. Their Catalogue of New Flower-Seeds, &c., is also ready.

A remittance or reference from unknown correspondents will oblige.—Wear Nurseries, Durham, Feb. 12, 1844.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to Public Competition at the Auction Mart, Bartholomew-lane, on Thursday, Feb. 29, 1844, and following day, at 12 o'Clock, about 300 DOUBLE CAMELLIAS, consisting of all the leading varieties, beautifully furnished with bloom-buds; also a fine assortment of STANDARD and DWARF ROSES, AMERICAN PLANTS, DAHLIAS in dry roots, &c. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

*** The Camellias will be sold on Thursday, 29th.

TO GENTLEMEN AND OTHERS ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietors to submit to public competition, in consequence of the expiration of Lease, on Monday, March 4th, 1844, and following days, at 11 o'clock, the Stock of ONE OF THE KENSINGTON NURSERIES, next the Great Western Road; consisting of large, healthy, and well-grown specimens of Ornamental Trees and Shrubs of every description: Variegated and Green Hollies, Evergreen Oaks, and Cork Trees. Large Fan and other Yews, twice transplanted; Common and Portugal Laurels, Arbutus, Alaternus, &c.; Hemlock Spruce, Pinus Laricio, Austriaca, and Nigricans, &c. &c. These grounds have long been celebrated for the health and beauty of their Trees and Shrubs, and safety of removal, and well worth the attention of those gentlemen who intend planting in the spring. May be viewed prior to Sale. Catalogues one shilling each, returnable to purchasers, may be had on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

FOR SALE.—Three pairs of SILVER PHEASANTS, last year's Birds (cheap). Apply to W. Lane, Post Office, Andover.

TO GARDENERS, NURSERYMEN, and Others.

TO BE SOLD.—Four Acres of excellent Land in the best condition, with Stock, Greenhouses, Frames, Implements, &c. A commodious Dwelling House, with a good connexion of 19 years' standing. Can have four Acres more adjoining, if required, with immediate possession. For every particular apply by letter, to James Black, 13, Charles-street, Kensington-square.

GRAINS TO LET.—Three Nails of Grains per week to Let, about 12 quarters each Nail. Hay, Straw, Corn, &c., would be taken in exchange.—Apply to Messrs. Staunton, No. 9, Strand.

AMERICAN FOREST SEEDS.—Messrs. EDMUND PHILLIPS & Co., 8, London-street, Fenchurch-street, beg to inform Seedsmen and Nurserymen that they have just received a consignment of all the usual varieties of the above, which they will sell at low prices. The Seeds have been selected with great care by a gentleman long accustomed to supply the trade.

Circulars with a list of the varieties can be had on application as above.

THE LATE MR. LOUDON.—A Public Meeting of the Friends of the late Mr. LOUDON will be held in the large room of the Horticultural Society's Establishment, Regent-street, London, THIS DAY, Feb. 17, at Two o'clock precisely, to consider the best means of extricating his Widow and Daughter from the difficulties into which they are placed by Mr. LOUDON'S sudden death.

It is hoped that noblemen and gentlemen who patronise Horticulture, and also all Gardeners and Nurserymen who are within a reasonable distance, will attend.

NEW FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c.

W. MILLER'S LIST appears in this day's Paper, offering his extensive Collections of the above Plants at very low prices:—as 12 distinct Sorts of choice Fuchsias, for 7*s.* 6*d.*; 12 fine distinct Varieties of Verbenas, 3*s.* 6*d.*; Anagallis, mixed Sorts, 4*s.* per dozen, &c. &c. &c. All sent post-free.

Providence Nursery, Ramsgate.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 17, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEK.

TUESDAY, Feb. 20	Horticultural	2 P.M.
	Linnean	8 P.M.
WEDNESDAY, Feb. 21	Society of Arts	8 P.M.
FRIDAY, March 1	Botanical	8 P.M.

MR. WILLIAMS is, doubtless, entitled to the credit of having taken great pains to explain in a popular manner, and with reference to the actual ordinary proceedings of everyday business, the nature and proportions of the different materials which find their way into a furnace, and particularly for impressing on the consumers of coal the distinction which exists between the earlier and later periods of the act of combustion, or rather of the act of destruction; for the first step is obviously, as indeed it has been always called, a process of distillation, in which heat, so far from being liberated, is rapidly absorbed from that portion of the fuel which is in a more advanced stage of decomposition. This distinction creates the first difficulty which Mr. Williams proposes to meet; but there is a second, and perhaps greater difficulty, arising from the liability of the coal to form carbonic oxide instead of carbonic acid, a change which renders a given portion of carbon less effective as a producer of heat, in the proportion of 1 to 2.

Both these points have long been well understood by chemists, and in some measure by practical furnace-builders; numerous attempts have been made to diminish the unfavourable circumstances, and to substitute a better state of things; but hitherto without any decided success.

The importance of the first question—that which relates to consuming the volatile products, may be judged of, when it is remembered that each ton of coal produces from 8,000 to 9,000 cubic feet of common illuminating gas; the heating powers of which must be immense, if brought properly into action.

Great, however, as this is, it sinks into insignificance when compared with the possibility of forming carbonic oxide in large quantities. The published analyses of coal are too discordant to furnish materials for accurate inference on this subject; but there is no question that the carbon which does *not* accompany the volatile products—that portion which remains after the hydrogen has taken with it so much as serves to render it luminous—or, in other words, that portion which is represented by the coke in a common gas-retort, is the main constituent of the coal for producing heat. If, therefore, this principal ingredient be consumed in the formation of carbonic oxide, instead of carbonic acid—the former converting only half the oxygen which the latter requires—the loss, as before stated, is one-half of the total heating effects in so much of the carbon as is thus disposed of.

There is a third question which is sometimes raised, and which may be of considerable consequence, though there are no decisive experiments on the subject. It is stated that if the hydrogen be not consumed by the proper admixture of oxygen, it will have a tendency to combine with some of the nitrogen liberated from that portion of air acted on by the carbon, and the resulting compound would of course be ammonia, which is supposed (we know not how truly), to be positively injurious, independent of the negative evil of having lost the unburnt hydrogen.

This is not, perhaps, of much importance, because the hydrogen is worth turning to account, for the first reason; and if this be accomplished, the third point falls to the ground.

The action to which coal is subjected in a furnace, then, may be thus briefly described: The fresh fuel is, in the first instance, heated at the expense of the heat already existing in the furnace; it is then put into a state of distillation, occasioning a still greater expenditure of heat, inasmuch as this process demands all the so-called latent caloric for the purpose of volatilising the hydrogen; and although it is possible that this expenditure may be repaid, if care be taken to secure the combustion of these volatile matters before they are out of reach, there remains still the difficulty before alluded to, of a very different, and, indeed, almost opposite state of circumstances at different periods in the same furnace.

This is the point at which all the inventors start. Some (but these are a minority) propose an apparatus capable of being modified by hand, so as to be adapted to the different stages of fresh, half-burnt, and incandescent fuel. To do this effectually, however, requires more skill and more attention than can be reasonably expected. We must look, therefore, for a furnace which shall be the best for an average state of things, and submit to a little loss at the extreme periods.

To begin with carburetted hydrogen. It is certain that, in order to consume it advantageously, an adequate supply of unvitiated atmospheric air must be supplied to it. Some have contended that this may be done by freely supplying air at the ash-pit, so that more shall pass through the fire-bars than the carbon will take up, and they presume that the remainder will go to combine its oxygen with the hydrogen. Others have supposed that if the door above the fuel have an opening, air may there be admitted in proper quantities, and passing unaltered *over* the fire, will burn the rising hydrogen. A third class requires that the air destined to burn the hydrogen shall never pass within the sphere of the influence of the burning coals, but shall be admitted behind or beyond the fire. Finally, Mr. Williams says that it is not enough to admit the air at this place; the air must be split into small streams to secure its rapid and intimate mixture with the hydrogen, or else combustion will not take place.

Whether it be true that no air will pass through the burning coal (retaining its oxygen), however freely it be supplied, we cannot pretend to say; nor can we assert that it will be sufficient to introduce it in front, but *over* the fire, as secondly proposed. Neither are we disposed to deny that there may be a decided advantage in breaking up the admitted current into a number of small streams, presenting, it must be allowed, a greater quantity of surface to the act of combination than would be afforded by suffering the air to enter at one large aperture. We think, indeed, that, with reference to the place of admission chosen by Mr. Williams, this division is good; for although we cannot agree with his reasonings upon the subject, we think that this arrangement gives the inflammable gases a better chance of being burnt before they leave the furnace, or its immediate neighbourhood.

Mr. Williams's arguments for thus minutely dividing the currents of air we must consider on a future occasion.—*A.*

IN speaking of the particular DISEASES OF PLANTS, we are not prepared to give a classification of them according to the principles on which systems of Nosology are ordinarily constructed. We shall, however, be obliged frequently to make use of terms which are employed to designate the diseases of animals; but we must warn our readers against supposing that there is any similarity between many of the diseases of plants and animals which have a common name. The important part which the blood-vessels and nerves play in the economy of animals must always produce a great distinction between their disturbed functions and those of the vegetable kingdom. At the same time, we must draw attention to the important fact, that *the tissues of both animals and plants originate in the cell*, and that probably no disease takes place either in the one or the other without one or more of the cells of which they are composed being more or less altered in structure.

The medical man divides diseases into *functional* and *organic*; and under the former head places all those diseases in which he cannot detect an alteration in the structure of the diseased organ; but this arises from his want of the power of observing the minute changes of structure on which the diseased function depends. There is no such thing as function independent of structure, and there is no evidence to prove that a function can be deranged whilst the structure is quite perfect. From the simple forms which the tissues of plants assume, we can much more easily detect slight alterations in their structure than can be done with those of animals. We shall therefore assume that there is no such thing as functional disease in vegetables, and that when disease occurs amongst them, it depends on altered structure, however little this alteration may be observed.

In the great majority of the diseases of plants, a change of structure may be easily seen, and in no case more evidently than in that form which we shall call *gangrene*. This is a term used in animal pathology to indicate the first stage of mortification or death of a part, and may be appropriately applied to the same occurrence amongst vegetables. Gangrene is most frequently met with in the leaves, fruits, and stems of plants, and of these parts, those which are most succulent are most liable to its attacks. It is divided by German writers into *moist* and *dry* gangrene; the moist occurring in the succulent parts of plants, and the dry attacking the woody parts, as the stem, of shrubs and trees. In this country all the forms of gangrene are frequently called *canker*; but this term is more especially confined to a peculiar disease of the bark and stem of Apple and Pear-trees, to which alone we think it ought to be applied, and on which we shall hereafter have occasion to make some remarks.

We shall speak first of MOIST GANGRENE, as we have recently had some inquiries made concerning its attacks. Of the families in which this disease occurs, it is probably most frequent in the Cactaceæ and Mesembryaceæ; it is, however, not uncommon in the Cucumber and Melon and other fruits, and attacks the Balsam and other succulent plants. On its occurrence in a plant, as in the species of Cactus, the stem is found in different parts to have spots of varying size, which at first have a darker green colour than the surrounding parts. The centre of these gradually changes colour, becoming first yellowish and then of a dark brown or black colour; whilst the circumference of the spot goes on increasing till it embraces the whole of the stem, the same changes of colour being observed. At first the affected parts appear slightly swelled; but they at length contract, and the epidermis bursts, and from the opening thus formed, a dark fluid oozes, which has a fetid, disagreeable odour. If allowed to go on, the disease spreads to the whole plant, the tissues become rapidly disorganised, and an almost entire decomposition of them ensues. On examining under the microscope the tissues of a plant thus affected, before its organisation was destroyed, we found that the greatest difference that existed between the sound and the diseased parts was in the colour of the cells. The diseased cells were much darker in colour, arising from containing in their interior a number of dark granules. They were most abundant near and in the bark, indicating that the disease commenced at this part. They were also more evident in the sounder parts around the hardened masses which are so common in the tissue of Cactaceæ. The fluid which oozed from the diseased parts was filled with irregular-shaped dark granules, of the same size as the regular transparent granules of the fluid of the healthy tissue. In some specimens of the Cactus speciosissimus attacked with gangrene, which we recently examined, we found in the diseased fluid a number of animalcules, apparently belonging to the genus Vibrio. Their body was cylindrical, tapering at both ends, and having the movements of a minute Gordius. We can draw no conclusions from this observation in a single case, but it is interesting in connection with the fact that an animalcule belonging to the genus Vibrio produces the disease known by the name of "cockles" in Wheat.

With regard to the causes of this disease, both cold and moisture will produce it. Succulent plants are susceptible of the action of cold, and if this is long continued the processes of life are no longer carried on, and the laws of chemical action begin to prevail, and the consequence is the departure of vitality and the appearance of this disease. Moisture, either in the soil or in the atmosphere, in too great quantities, will bring on gangrene, and more especially when combined with a low temperature. A too great quantity of water in the tissue, which may occur either from there being too great a supply to the root, or too little facility for getting rid of it by exhalation, will deprive the plant of vital power, and expose it to the destruction of its tissues, from the prevalence of the laws of chemical action.

Such being the cause of this disease, the treatment must always be directed to the immediate removal of them. The diseased parts should be cut away, and every precaution taken to insure a proper amount of temperature, a drier atmosphere, and drier soil. But it should be remembered that these are only relative terms, and that what may be an excess of cold or moisture for one plant, so as to produce gangrene, may be for another plant of the same genus only that which it requires for the performance of its healthy functions.—*L. E.*

BEES.—No. VII.

(*Concluded from p.* 83.)

The Destroying of Bees and the Uniting of Swarms.—The time of taking or harvesting honey depends upon the locality, the state of the weather, and the lateness of the season. The proper time is when the Bees begin to eat more than they gather; and this, generally speaking, takes place about the 1st of September. In ordinary fine seasons your second swarms and turn-outs will weigh from 30 to 50 lbs. From these you should select some for stocks, the first swarms being generally too heavy. Choose those that have bred well in July and August, that are full of combs which consist of worker-cells. If you should select a first swarm for a stock, be sure that its queen is not three years old. If it is old kill it, and put a young one in its place; for you will, by allowing a queen to die a natural death, incur the loss of a swarm, that is, if your hives are large. If you should select a second swarm or turn-out, that has an unprolific or an untimely-impregnated queen, destroy her, and put a whole swarm with a good queen into the hive. The uniting of swarms is a very simple concern. After having drummed the Bees out of one hive into an empty one, invert the hive into which they are to be put, and throw them *en*

masse into it, sprinkling a little sugar and water over them previous to placing it on the board. This is an infallible way of uniting swarms. The proper time to do it is about sunset. But be sure never to do anything with Bees when you are perspiring, the odour of perspiration being peculiarly offensive to them.

Almost everybody knows how to kill Bees. A pit is dug, one edge of which is undermined, in order that the ignited rag, previously dipped in melted brimstone, may not be extinguished when the Bees begin to fall; the hive is placed over the pit, and the soil is thrown round it to keep in the smoke. Some people seem to think that it is cruel to kill Bees in this manner, but I contend that it is as cruel to kill a bullock to get beef, or knock a calf on the head to get milk, as it is to kill Bees to obtain honey.

The taking of Honey and Wax.—Various systems are adopted to take honey from the combs. Some cut the comb piecemeal, and put it into a bag, which is hung up before the fire; some take the lids off the cells, and cause the honey to run through a cloth; and some squeeze the honey out of the comb with the hand. The last is the most speedy way—one man being able to take from hives, squeeze, and run through a bag, 150 lbs. in one day. That the combs may not contain b ood when you take the honey, it is advisable, in many cases, to kill the queens three weeks before you massacre the Bees. Swarms will probably issue on or about the 18th day from that on which the queens were killed, but let them go—they are valueless—the season is over. Wax is made like dripping. The combs are boiled in water till all the wax is on the top, when it is ladled into a bag, which is placed on a board in a large tub, and then pressed hard with a small wooden roller. It is boiled again in clean water and put in milk-pans, where it congeals and forms cakes. The boiling wax may also be run through a hair sieve.

The Enemies and Diseases of Bees.—Bees themselves are their greatest enemies; they are very apt, particularly in the month of September, to rob one another. In the month of September, a mouth-piece, that is, a bit of wood with a hole therein large enough to allow the Bees to drag out their dead, and small enough to keep out mice, which are also enemies, should be fixed in the door of every hive. The entrance to the castle is therewith more easily guarded. Still, if one hive be invaded by the Bees of another hive belonging to yourself, the invaders ought to be removed to a distance for a week or two; but if the invaders do not belong to yourself the invaded hive ought to be removed. There are only two diseases of Bees that merit notice in a concise article like this. One of these is caused by back-gone broods, the other by watery honey. The limits which circumscribe my remarks forbid my enlarging on them. Bees never thrive well where there is a back-gone brood; indeed, its unpleasant odour sometimes causes the Bees to leave the hive. In rainy or dull summers Bees are apt to collect honey before the flowers are quite dry. In winter this honey becomes sour and poisons them. I knew a man who gave 20*l.* for 20 stock-hives in autumn. Before the spring following they all died but three, one of which was in an unhealthy condition. Notwithstanding this great misfortune, he realised 20*l.* from the produce of the three during the first year, and it is thought increased his stock of hives a little. Sugar and water are the best remedy. In autumn, straw covers should be put on hives, to protect them against the inclemency of the weather. When snow is on the ground the doors of hives ought to be kept shut; the Bees being apt to come out when the snow is melting, into which they fall and die.—*A. Pettigrew, Wrotham Park, Middlesex.*

THE SPRING MANAGEMENT OF HALF-HARDY PLANTS INTENDED FOR MASSES OR GENERAL DECORATION.

It so happens with the majority of gardeners as well as amateurs, that, through a deficiency of glass, one frame or pit must play in its season many parts. Now, it is very necessary to know how to economise in these matters. It is comparatively easy to produce everything in its season in first-rate establishments, where, instead of there being a want of glass, there is a pit or pits always at liberty. But to make a little glass go a long way, and in some degree to endeavour to compete with more complete establishments, requires considerable knowledge of first principles, and a clever application of them. At this season, those who are placed in the last predicament, are sometimes puzzled to know how to discharge the winter tenantry of frames, wanted for early Cucumbers, Melons, Potatoes, Carrots, &c., with as little injury as possible to these delicate tribes. I will, therefore, detail my mode of accomplishing this, which I have found very successful:—In the first place, a most material point is to take care that the various cuttings, &c. intended for flower-garden decoration are struck early and well established in their store-pots before the winter sets in, as in the event of their being propagated late, they will require to be watered late in the season; and here lays one of the prime secrets in the affair.

Flower-garden stuff of the above description I take care to get into their store-pots by the beginning of September: my mode of potting stores is this:—After a few very rough crocks in the bottom, I place a layer of clean riddled rough old tan to within four inches of the top of the pot; the stores are placed immediately on the tan, and the pots are filled up with a compost, of which one-half is strong or stiff loam in a rough state. Now, this stiff loam is well known to be very retentive of moisture; and when the stores lay hold of this soil firmly, there will be no occasion or watering; they will stand any amount of drought all through the winter in very low temperature. The plants will, perhaps, flag a little at times, but this is in favour of the whole process. Under these circumstances I always withstand the temptation of watering. Here, then, is a principle of acclimatising, and abundance of air at all times, excepting during hard frosts, is all that is wanted; only keep to these principles, and frost will have less effect. In the first or second week of February, I begin to prepare for removing them; and the first thing to be done is to inure the plants for a week or so, previously to a lower temperature, viz., to a little frost; this is done by refraining from night coverings on evenings which promise a small amount of frost; for, by this time, if they have not been petted, they will endure a little frost, observing that when the weather is very hard, viz., sunny days with intense frost at night, not to uncover in the day; do not let them see the sun by any means; let them remain at rest. The same principle applies to Lettuce, Cauliflower, &c., of course in frames.

This preparation completed, I throw out a trench on the north side of a wall, before my Morello Cherries: the trench is from 2 to 3 feet deep, and 3 feet wide at bottom, sloping to 3 feet 9 inches at top; the plants are lowered into the bottom of the trench about the second week of February, or perhaps the third, according as the frames are wanted—observing to take out some of the very tender kinds, or those liable to canker, as also any kinds from which it may be necessary to propagate; the latter being placed in heat to excite young wood for cuttings, and the former set on shelves in a cool greenhouse or Peach-house.

These cool pits have straw mats for covers, which are made by me from old hacked-out lights, by merely placing new and good straw transversely across the bars, and then tyeing down three laths or strips of wood longitudinally, from one extremity of the sash to the other; these hold the straw firmly in its place. This kind of straw hurdle is very economical and efficient, as two men can make a dozen in a day, and they do to cover Lettuce, Salads, &c., at various periods of the year.

The only management the plants require in their new habitation is to keep the straw hurdles closed down for a couple of days at first, or partially tilted, and to let them occasionally remain on through very cutting winds, observing to close them down always at night, unless in very mild weather.

Towards the end of February they may receive their first watering, taking care to give it but sparingly, and very seldom, until they begin to grow, when they may be potted off singly for masses. It is astonishing to witness the progress they make after coming from these cold pits, and getting into warmer habitations, as they never obtain a glimpse of sunshine in the cold pits.

Much mischief arises to various plants in frames from sudden vicissitudes of weather, especially that of warm sunny days during intense frost. I make it a rule with plants that will stand a little frost, such as Cauliflowers, Lettuces, &c., to get them frozen tolerably hard whenever frost occurs, after they have become hardened (say through December and January), and then to cover them up close with straw, which I never remove while I can keep them frozen; indeed it must not be removed suddenly when a thaw takes place. Darkness has no prejudicial effect on them while they can be kept frozen. I have had them in this state for three weeks at a time, with no injury therefrom.—*Robert Errington.* [Excellent advice.]

A KNOWLEDGE OF PRINCIPLES ESSENTIAL TO THE BEST CULTIVATION.—No. II.

(*Continued from page* 84.)

In the process of shifting, whether it be a single and accumulative one or repeated shiftings, it should be remembered that the amount of soil to which any plant is subjected should in all cases bear a strict proportion to the intervening period between the process of shifting and the season of bloom. For instance, Fuchsia tricolor is well known, beyond most varieties, by its premature disposition to form flower-buds, consequently (unless it manifests an exuberant primary growth) it should be excited earlier than others, in order to secure a longer period of growth previous to its season of flowering. A second instance occurs in Fuchsia conspicua arborea (of a noble and distinct habit), much larger in its growth, and later in the formation of its bloom, but not less certain and profuse when its maturity is attained. Thus, two extremely opposite-habited plants are equally fertile under their essential conditions of growth, and hence the error of applying one rule to both.

Other instances might be adduced to show that the most luxuriant growth, of which some plants are capable, is the only direct and certain mode of attaining fertility—as, for instance:—Costus Nepaulensis, and Acacia Kermesina, (the former with white blossoms, enveloped with crimson sheathes; the latter with an elongating spike of elegant crimson tassel-like flowers) both beautiful stove plants, totally dissimilar in structure as well as in the soils essential for their growth, but each requiring a luxuriant annual development of growth to ensure a perfect bloom.

Many objections will, doubtless, be made to an exuberant growth, as being unfavourable to fertility. Other conditions being favourable, I would still urge that the highest capability of plants is generally involved in their most extensive and luxuriant form of growth. An objector would add, "restrict the proportions and cramp the energies of a plant, and I am sure to obtain a certain extent of bloom." I would rather say, where the highest effects are sought for, "provide the means for its perfect growth prior to the season of bloom; encourage Nature to mature its legitimate proportions, and you will ensure a uniform and perfect result."

Apart from the highest known vigour of any given plant, it appears impossible to ascertain what are its capabilities of fertility. I would say to a cultivator, show me what you deem the most perfect extent of growth in any given plant, and I will define the average excellencies of the same under every other condition of growth. Can there exist any doubt that if the knowledge of any tribe of plants, say Heaths, Pelargoniums, or Pine-apples, should lead to a larger and more perfect growth, that such an advancement will not lead to the attainment of a greater extent of perfect bloom and larger fruit?—Verily not. As every plant is capable of a certain extent of growth under the most favourable circumstances, it may be assumed, that a system of cultivation, equal to a perfect growth, is essential, and antecedent to a perfect development of bloom.

That there should often exist a striking difference in the application of principles to the operations of art, is far from surprising, when the differences connected with professional experience are duly considered, as well as the counteracting influences which a defective education often exerts over men's capacity or taste. How often have early impressions formed habits of preference, until tyrannical custom has become confirmed prejudice. How often have facts proved impotent, until reason has asserted its right to question the opinions of others, and to ascertain the truths upon which such opinions are founded.

These remarks have, in part, been suggested by those of a Correspondent at p. 892 (1843) where an objection is made to the principle that is involved in that mode of cultivation which says, that "plants the most difficult to rear should be removed at once from the cutting or seed-pot to the one in which they are to be exhibited as specimens." To all such criticisms I answer that I have no objection to the method which the correspondent alluded to prefers in his own case, namely, to "have a plant thoroughly established in a small pot before it be removed to a larger one," provided that such a rule is not substituted for the principle upon which my statement is founded, and upon the correct application of which the highest effects of cultivation depend. I will even add that a gardener may be justified in giving a second shift prior to the final one, if such a process is more compatible with his skill, or with the means at his disposal for maintaining a course of treatment sufficient to produce the requisite effect. But any rule which seeks by a repetition of causes for an effect which Nature would produce by the immediate application of one, I do not consider entitled to the name of a principle—which is a fundamental law of Nature. If, for instance, one gardener considers the establishment of a plant in a small 60 of essential importance previous to its removal to a 16 or 12, another may insist upon a further shift to a large 60 or 48 before removal to a 12 or 8, and thus each would claim for his rule an importance which can only be conceded to a principle.

Principles are to be learned, not improved. Their apparent impracticability and variance with general practice in no respect lessens their value, which is determined by their truth, and not (necessarily) by their application. —*William Wood, Pine-Apple Place.*

FAMILIAR BOTANY.

Morphology.—No. III.

"Le Sphinx n'est plus assis sur le seuil de notre temple!
Pour jamais les secrets s'ouvrent à tous les yeux."

Although sound physiology refuses to sanction, in their full extent, the views entertained by Linnæus, and notwithstanding that it teaches us to know that the process of anticipation is imaginary, yet it is impossible not to admire the farsightedness of that great man, which enabled him to perceive the general nature of the great truths with which the Morphologist is now familiar. His contemporaries, however, in general were so wholly destitute of a philosophical spirit, that they were unable to appreciate the value of his speculations. For them a flower was a flower, a fruit a fruit, and a leaf a leaf. They were contented with the barren knowledge that such organs existed, and it did not enter the imagination of the dull school which Linnæus founded to inquire on what plan they were constructed or by what means the wondrous variety, so eminently conspicuous in the vegetable kingdom, was provided. Occupied with counting the stamens and pistils of a flower, they never considered the general laws of organisation worthy of their study. There was, however, one great exception.

Dr. Caspar Frederick Wolff, a Prussian physician, and one of the Professors in the University of St. Petersburgh, described, in the year 1768,* the manner in which the parts of plants are formed out of leaves, with so much accuracy that modern investigations have done little more than confirm his views. "A man," said Wolff, "must be very dull who cannot perceive that in some plants the calyx is but slightly different from the leaves, and is in fact nothing more than a collection of many small and imperfect leaves. Many of those annual plants which have composite flowers show this very clearly, for you have in those instances leaves becoming smaller and more imperfect as they rise up the stem, until at last those which are highest of all become extremely small, are closely clustered together, constitute the segments of the calyx, and in their mass form, in fact, the calyx itself. The seed-vessel in like manner is plainly formed of leaves, with this difference only, that the leaves which are merely collected together to form a calyx, are in the seed-vessel glued together. This is proved not only by the capsules of many plants which, when they are ripe, split into the

* Novi Commentarii Academiæ Scientiarum Imperialis Petropolitanæ, vol. xii., p. 403.

leaves, or parts, out of which they are compounded, but by the actual structure and external appearance of those parts. So, again, seeds, although at first sight they seem to be so different from leaves, are really true leaves glued together; for the seed-lobes into which they split are but representations of leaves, although indeed imperfect, shapeless, small, thick, hard, dry, and colourless. If you doubt it, only observe how those lobes, when the seed is committed to the earth, by degrees expand into a perfect green succulent foliage. As for the corolla and stamens, that they are only modified leaves is made manifest by many observations. We often see the divisions of the calyx change into petals, and these, in like manner, alter into a calyx; and here, as the calyx is manifestly composed of leaves, and the petals are of the nature of a calyx, it is clear that the petals are also modified leaves. In like manner, we see in polyandrous plants stamens degenerate into petals, and so form double flowers, and then again petals return to stamens: a sufficient proof that stamens also are of the nature of leaves. In short, in plants, wonderfully and admirably as their parts are constructed, all things considered, I can recognise nothing except leaves and stem (for the root belongs to the stem)." And further on, he declares, that his observations have convinced him that "As the force of vegetation diminishes various changes are brought about, and that all the modifications of leaves consist merely in a deficiency of perfection (*in defectu perfectionis*)."

In the year 1790, the poet Goëthe, knowing nothing of the writings of Wolff, but acquainted with the speculations of Linnæus, published his Inquiry into the Metamorphosis of Plants* in the form of a pamphlet of 86 pages, in which he demonstrated, in considerable detail, the truth of most of Wolff's views, and finally laid the solid foundations of what is now called Vegetable Morphology. But at the time when his doctrines were promulgated, Goëthe, like Linnæus and Wolff, found the world too much occupied with the surface of things to trouble itself with inquiries the end and aim of which it was unable to comprehend; and it was in fact full 30 years after the appearance of the last-mentioned work that the science of Morphology became fully established. Since that time it has made such progress that it is, I think, impossible now to name a Botanist of any eminence who entertains a doubt upon the subject; which is justly regarded as one of the clearest manifestations of the power of Him "which doeth great things past finding out; yea, and wondrous without number."—*R. E.*

THE ROSE-GARDEN.—No. V.

(*Continued from page* 84.)

Sorts of Stocks for Different Roses.—Different Roses require different stocks. A tree that of itself would make a yard of wood in a season, is confined and injured in its operations, by having, perhaps, a single bud upon it of some rare and tender sort of Rose, which makes but feeble and delicate shoots. If left to itself under such circumstances, the extra sap would find a speedy mode of escape, by sending forth innumerable shoots from below the bud, and the bud would soon have but a bare subsistence. Roses which are free growers, such as the Noisette, &c. will generally be found to succeed better upon the wild stock than others, their habits of growth being more assimilated. The Wild Briars grow very late in the year, perhaps more so than almost any other wild plant; and the free-growing bud avails itself of, instead of checking, this propensity, and draws up the whole sap the standard can produce; thus keeping up the full activity of the tree, thriving and recovering a stagnant stem better, and being less encumbered with suckers than delicate sorts. Comparatively speaking, the White Moss, on the contrary, can hardly be kept alive when grafted upon the Briar.

Again, if a free-growing bud, such as the Noisette, Greville, &c. were put upon a small stock, the bud would entirely drink up the sap of the stock; and, instead of making a fine bushy head, would either grow in one long shoot, or, at all events, make a small and mean head, in comparison to what it would have done upon a larger stem. Stocks, therefore, should be chosen with reference to the purposes they are intended to be put to; the bringer being desired to cut them above the first fork (both in order that the whole stem may be preserved, and that the strength of shoot they are likely individually to produce the succeeding summer, may in some degree be judged of from the quantity of head to be cut off, and its clean and healthy appearance); it should be remembered that stocks being so very easy to procure, none but the very straightest and best should be chosen; and the rejected ones may be planted in some out-of-the-way place, to be used in case they should be wanted. About a third more stocks should be chosen than are absolutely wanted, and the others may be laid in the ground, as a *corps de reserve*; they will most likely be worked in the season, and without costing any trouble, except as to budding, according to their health and strength; the advantage of a supply of different heights, sizes, and sorts will be obtained.

When the stocks are taken up, they should be kept as short a time as possible out of the ground, as the air injures the root. This is of the greatest importance, as the strength of the expected shoots will mainly depend upon it; but if they have been weakened by lying out of the ground, they will regain a portion of their strength by being much shortened in the stem; for the roots of all trees being proportioned to the trunk they have to maintain, it is evident that an injury to the one should be followed by a reduction of the other; and thus, to a certain extent, the more head removed in the autumn, the freer supply of new wood will be produced in the spring.

If it be desired to keep stocks some time before planting, they must, like all other trees, have their roots covered with mould, which is technically called, laying by the heels. When stocks are sent any distance, a puddle of clay and water should be made, and the stocks dipped in it, so as to form a coating to defend them from the wind; and then, being packed up in an old bass-mat, they will carry without injury.

The trimming of the stocks is next to be considered; first, as to the requisite height; secondly, as to the mode. The heights most desirable are, four feet, three feet, two feet six inches, two feet, one foot six inches, one foot.

The manner is, by a clean slanting cut, at about an

angle of fifty degrees, the upper part of the remaining stock being a quarter of an inch above a bud. If the bud be not enough marked to show its position, let the lower part of the slant be that distance above the ring denoting where the bud is to spring from, and the extra plant can be afterwards removed. The object of cutting so near to a bud is, that when the first shoot starts, the bark may begin to form over the wound; but if there is any distance between the wound and the base of the new shoot, this will not be the case, and the dead wood will gradually eat into the stock. If, therefore, the excision is not made in such way that the stock may begin to be covered the first year, it will be better to leave a few inches (viz., as much as is between the bud cut off, and that desired to produce the new shoot,) that the tender shoots which spring from the inserted buds may be tied to it, delaying its removal till the graft has become strong enough to heal the wound when inflicted. This will in general be about eighteen months after budding, when care must be taken to cut close to the base of the shoot, which enables the rising sap to cover the wound more easily. In all cases the wound should be covered with either the undermentioned mixture immediately, and a small piece of grafting clay, or, at least, a little mould should be rubbed upon it.

Trimming the root is a matter, if possible, of even more consequence, because but one more opportunity will be afforded of reviewing this part of the work, and perhaps none of retrieving mistakes. The longevity of the plant depending mainly upon the roots, it is necessary to shorten all those which are long and thick, and to remove heavy lumps and clumps of unserviceable wood, leaving, as nearly as possible, only such parts as are furnished with small fibres and roots. This will afford an opportunity of planting the stocks with greater care; and of forcing them to make fresh shoots, (which, in good ground, they will be sure to do,) and thus continue to improve. The roots, however, requiring the *same attention* as the branches, for a closer investigation of the subject, see *Transplanting*. It is, therefore, only necessary to add here, that attention must be paid to these points; and for the greater convenience of cutting the roots which are sometimes twisted and in cramped positions, it will be desirable to borrow a carpenter's small saw, of this shape, as well as a hand-saw, and thus

every facility being afforded in cutting the roots exactly as they may require, the work will be much expedited, as well as improved; but it must be remembered, that wherever a saw is used, either to root or branch, the surface left must be smoothed over with a knife.

Having finished these operations, and ascertained the heights desirable for the stocks, this is the proper time for shortening them, previous to planting in rows for budding upon.

Mixture to heal Wounds, and Mode of Application.—Five-eighths of black pitch, one-eighth of resin, one-eighth of tallow, one-eighth bees'-wax:—or, half bees'-wax, half pitch:—or, one pound of white Burgundy pitch, a quarter of a pound of black pitch, a quarter

Home Correspondence.

Farming and Gardening.—About here, there is a strong prevailing prejudice expressed in the term "that good gardeners make bad farmers." Why this idea should exist I cannot discover, unless the pursuit of Horticulture is supposed to absorb the attention so much as to cause the farm to be neglected, (which can only refer to enthusiasts or mere florists,) as the numberless phenomena to be observed in garden cultivation, and which may escape the notice of the farmer, might be generalised by an intelligent mind, and frequently applied with advantage to the larger business of the field. It is true that there is scarcely a farm-house without its garden, but when it is a large and ornamental one, in nine cases out of ten it owes its beauty and utility to the care of the lady and not to the master, who, if a money-getting man, grudges the land and perhaps the labour, and sometimes even the manure necessary to provide the kitchen with Cabbages, Peas, or Potatoes, and particularly where the mistress also thinks more of feeding calves, churning, or brewing, than of ornamenting her table with a bouquet. We may be sure if an early dish of Peas is forthcoming, a fine head of Celery, or a large bunch of Grapes, that the lady has extended her cares to the garden. I know of only two instances in this neighbourhood where farmers make the garden an object of attention; they have each a collection of plants, an abundance of good vegetables, and excellent fruit all the year round; nor are they behind any of their neighbours in the management of their farms, the land is drained, the fences well kept, and they take prizes at the Agricultural shows. In all the other instances of a tolerable garden to a farm-house within the range of my observation, the lady of the house directs the "rotation of crops," preserves the seeds and bulbs, and takes jealous care of the fruit; purchases the plants, and distributes the flowers. Whether this cheerful and necessary appendage to a farm be "kept up" by the farmer or his wife, may not signify much to the supply of Horticultural products for the house; but it does signify greatly that the man should be interested, if he only wishes to avail himself of the information conveyed by the *Agricultural Gazette*. All cultivation on a small scale is *gardening*, such as experimenting on manures, reproducing small parcels of picked seed, examining the relations of certain soils and vegetables, and acquiring a knowledge of the pernicious or useful properties of the different families of plants (as of the Flax Dodder last week). A farmer, adapting himself to the necessities of the times, must become more and more familiarised with gardening operations, and this extending to a habit will also induce a spirit of inquiry, and he will reconcile himself to become in theory, as he already is in practice, a botanist, a chemist, a geologist, and a gardener. —*J. W., Peterborough.*

Gas Tar.—I have tried this substance repeatedly for some years upon fruit-trees in my nursery, and in all cases it has answered the purpose of keeping off hares and rabbits, and instead of being injurious, I imagine the trees are benefited by its application: the only thing necessary to be observed is, that it must be applied when the trees are in a dormant state—say from November to March; if done at any other season it is certain death. My attention was first directed to the use of gas tar by Mr. Elliot, woodman to the Earl of Carlisle, at Castle Howard, where forest planting is done annually to a great extent, and where game is so numerous that it is necessary to apply gas tar to every tree that is planted. At this place it has always answered the purpose of keeping the hares off, and does no injury to the trees.—*William May, Hope Nursery, Leeming-lane, Bedale, Yorkshire.*

Greenhouses and Engine-houses.— A correspondent suggests that engine-houses are well calculated for greenhouse plants, as they are well lighted and heated by the sun and engine, and the work-people have no access to the room. He informs us that Messrs. Wrigley, of Cobster Hill, Oldham, have, in an engine-house connected with their cotton-mills, several Orange-trees in good health, producing moderately-sized fruit.

Cucumbers.—We last week gave a report of the Cucumber exhibition at Ipswich. Since that time we have seen the prize fruit of Mr. Leathes and Capt. Aplin; and we feel bound to state that they appear to us to realise all that can be accomplished by Cucumber-growers. We seldom see such fruit about London *at this time of the year.*

A Natural Mode of Destroying Insects.—During the present severe weather my gardener caught half a dozen of the Blue Titmice (Parus cæruleus), only one of which I succeeded in placing in my greenhouse, with the intention of hereafter setting it at liberty. No sooner had I turned it amongst the plants than it commenced assiduously to clear them of insects; and to my surprise and gratification, I have observed that many which I could not properly cleanse myself, particularly Cinerarias, have been completely freed from these unwelcome visitants; nor has, so far as I could observe—and I carefully examined one or two of the plants—the slightest injury been sustained; and I have enjoyed the greatest amusement in being a spectator of my little captive's labours.—*Oιλος.*

Pruning Forest Trees.—If I were assured by Mr. Hamerton that he had ever seen five acres of plantations or one hundred trees on hedgerows pruned for five years in succession, his objections to pruning might have some weight; but in the absence of this proof I must be allowed to maintain my opinion of the advantages of judicious annual pruning, founded on the experience of 30 years. The plantations at Nerquis have been inspected by numerous individuals of the highest respectability, who bear testimony to their flourishing condition. Mr. H. should also not forget that the land thus planted cost only 1*l.* per acre at a time when property of this kind was more sought after, and that its high situation, (800 feet above the sea,) soil, and cold climate, are adverse to the growth of trees. By reference to the *Gardeners' Chronicle* of Sept. 16th and 30th, Mr. H. will find the girth at the bottom, and at seven feet in height, and also at the height of clean straight timber, without a branch. The popular feeling against pruning has its origin in the wretched manner in which ignorant planters at uncertain intervals mangle their trees with hatchets.—*Philo-Sylva, Northampton.*

Pruning Forest Trees.—This subject is one which it is impossible to urge too much upon planters, as involving consequences of the utmost importance to the successful issue of much of the extensive planting which now exists over the whole country. I can speak with great confidence of the certain approval which the mode of pruning

as pointed out by Dr. Thackeray must gain for itself, if only fairly and properly tried. The result of it, as Dr. Thackeray states, is "that the sap, which the cut branches would have exhausted, gives vigour and increased strength to the trunk." And why is this the case? Because the sap which nourishes the tree is not only equalised where the trunk most requires it for the production of timber, but the sap so produced is of the most healthy and nourishing description; since the never-failing result of the principle of pruning rightly practised, is to send out leaves from the lateral branches, and these, too, of a fine, full, healthy kind, and in which of course the sap is elaborated.—*R. P. N., Hallyburton.*

How Bees collect Pollen.—Many are unacquainted with the use of the balls of pollen seen on the legs of Bees, as well as ignorant of the way in which they are collected. Reaumur and Buffon, for instance, considered them the elements from which Bees formed wax; this remains uncontradicted in a work by the latter even as late as the year 1821. Another author states that "she (the bee) gathers pollen from flowers with her mouth into round balls; she sticks these pellets into two hollows, which are on the outside of the same joint on her hinder legs." Bees store up pollen solely as a provision for their brood. Wax is secreted through the segments under their bodies, but it is doubtful how they come by it previous to that singular process. As Bees frequent plants abounding with wax, I imagine that they collect it from them in the same way as the Wasp does its materials from decayed wood, or the Aphis, which produces the glutinous substance sometimes called honey-dew, that differs but little from the saccharine juice the insect had previously sucked from the tree or plant it infested. Some considered Bees' wax to be a "concreted animal soil." Amongst those who held this opinion may be ranked an excellent apiarian, Bonear, who was perhaps as nearly right as some scientific men, when he observed that Bees might produce wax in a similar way as that produced in his own ears. It is worthy of remark that Bees have produced wax when fed on honey and sugar—hence arises the belief that Bees form wax from these substances. But in such cases it is difficult to say what store of wax Bees might have in themselves before confinement. The balls on Bees' legs are accumulated by the insect putting one of its fore feet, which serves as a kind of brush, into a flower and then placing it between a series of strong curved hairs on its hinder legs, where the pollen adheres and forms the little balls. A superficial observer might suppose that Bees collected pollen by "rolling themselves in flowers," in a Hollyhock, for instance, for in such flowers, abounding as they do with pollen, they cannot avoid being dusted with it. "Mealy Bees" may be seen entering and issuing from the hive; the pollen that happens to fall from them when depositing their loads discolours the combs. The colour of pollen depends on the colour of it in the flowers the Bees frequent. Some writers say that Bees collect the greater part of their pollen in the morning, but as dry weather is most favourable for that purpose I imagine that a little farther in the day is more suitable for gathering it, as well as honey, both are alike essential to the prosperity of the colony. Much pollen or Bee-bread being often found in tenantless hives is no proof to the contrary. Bees live on honey, their larvæ upon Bee-bread, as already noticed, and they come more slowly into existence, as the former falls short, owing to want of attendance and lower temperature, occasioned by the Bees dying off. These remarks account for Bee-hives being deserted whilst they contained abundance of pollen in good preservation. —*J. Wighton.*

Feeding Bees.—A Correspondent recommends feeding Bees with loaf-sugar, as moist sugar produces diarrhœa. He is quite correct as to the danger of diarrhœa being produced by moist sugar, partcularly by the coarser sorts, and as a preventive I would recommend a small lump of common salt being placed upon the board close to the entrance of each hive. This the Bees are fond of, and it has proved with me a certain cure for diarrhœa. About three years since my Bees were attacked in a most alarming way by that disease, and before I was aware of it I had lost nearly two-thirds of every hive. I then ordered my gardener to place the salt as before mentioned, and, after one or two days, I did not lose another Bee. —*A. F.*

Potatoes.—The subject of Potatoes failing in coming up after planting, is attributed by some to their being planted in one soil for a number of years. They say that the Potatoes gradually deteriorate, and lose their vegetative principle; but this does not always occur. I have planted one sort, known by the name of the Bread fruit, for the long period of twelve or fourteen years, and they are not in the slightest degree altered, either in size, crop, or flavour; they are of a dry and mealy nature. There has not come under my notice one root that was diseased. I fully agree with Mr. Wighton, that the late sorts of Potatoes should not be planted until the latter end of May, or the first week in June.—*Herbert, Sussex.*

Campanula pyramidalis.—I either sow the seeds, or pot cuttings from the old roots in leaf-mould and sandy peat; as soon as they are strong enough I pot them off into 60 sized pots, regularly shifting them into larger sizes as the plants require them: when they have gained a little strength, I give them a rich loamy soil, well incorporated with a small proportion of bonedust; and at intervals supply them liberally with manure water. I do not find them flower vigorously under two or three years, but at that age I have had plants of both varieties, nine feet high and covered with bloom.—*J. L. Snow, Swinton Gardens.*

Large Pine-apples.—In your accounts of large Pines, allow me to state that you have overlooked my father, who grew three large ones when living at Rheola, with John Edwards, Esq., Neath Vale, Glamorganshire, and which are noticed in the 1st part of the "Gardeners' Magazine," at page 453, in the year 1826. The dimensions and weight were as follows:—

July 18, 1824—One New White Providence, 11lbs. 12 oz.
April 7, 1826—One do., circumference 21 ins., height 10½ ins., 4 gill suckers, weight 11 lbs. 15 oz.
April 10, 1826—One do., circumference 26 ins., height 12 ins., 4 gill suckers, weight 14 lbs. 12 oz.

The last two were taken from the mother plant, March 29th, 1825, and left four plants as good as those the fruit was cut from. The largest was presented to his Majesty George the Fourth.—*Richard Dixon, Dolancothe.* [We remember these Pines; but what is a Providence, *with four gill suckers*, weighing 14 lbs. 12 oz., as compared with a Queen weighing 6 lbs. 11 oz., and with no gill suckers. The Pine in question was, however, an enormous one certainly.]

Pits.—The accompanying is a plan for pits which I am about to build. My object is to have three distinct compartments of different characters, and to heat No. 3 with the radiated heat from the boiler; the Melon pit with hot-water gutters and a flue; and in No. 1, I intend having

two hot-water tanks and the continuation of the flue. This arrangement, I imagine, will be found exceedingly useful to amateurs, with small gardens like myself, and one that will require as trifling an expenditure for fuel as possible. I should have made my end pits at least 12 feet long, and the centre one 20 feet, but I am confined for space.—*A Friend to Floriculture.*

Vegetable Refuse for Melons.—Mr. Torbron states, that, when gardener to the late Mr. Knight, he prepared a bed of Oak-leaves for Melons, 5 feet high at the back, with a proper slope to the south. On this was placed a frame, having 4 sashes, each 6 feet long; it was sufficiently deep to hold 15 or 18 inches of soil, allowing head-room for the plants. The soil was obtained from a meadow, which had been rendered fertile by being flooded from a river, and was mixed with vegetable ashes in the proportion of about 1 part in 30. The plants, which were of a kind then in repute, called the Salonica, were ridged out early in March, and a genial heat was maintained by means of linings. They were watered with water mixed with pigeon-dung. The fruit ripened in due time, and many of them weighed between 6 and 7 lbs. each. Mr. Knight observed that, previous to that time, he had never known one of the same kind to weigh more than from 2 to 3 lbs. One of the Rock Melon, treated in the same way, was also equally good.

Season for Repotting Plants.—Examining some greenhouse plants lately, I found that they had all made quantities of roots round the ball of the plant, and from the circumstance of these having evidently been formed after the plant had ceased growing, it occurred to me that autumn would be a better time for shifting plants than spring. It is clear that these fibres had been made when the plant was in a dormant state, and it is certain that unless they are supplied with fresh soil, the plant will not be able in the following season fully to develop its parts. The practice of spring shifting is attended with danger of breaking these newly-formed roots, and this gives a check to the plants. Plants in general should be shifted during their season of rest, for it is then they make the feeders that supply them with nourishment in the spring, when they begin to grow. Peach-trees and Vines clearly prove the assertion to be correct, for when they are forced without having had a due season of rest, the result is always unfavourable; this arises from their not having had time to form new fibres. When leaves begin to fall off, plants commence to form young rootlets, which absorb nourishment, and from these, on the first excitement of the plant, the sap ascends; fresh roots are afterwards made to keep up a supply through the season. It is necessary to keep these roots as dry as possible in winter, in order to preserve them from rotting, for if they perish the effects will soon be seen on the plants. This is an objection which many have to shifting greenhouse plants in the autumn; but if water is given with caution and the pots well drained, there is no danger to be apprehended.—*J. W. K.* [This statement is open to very considerable doubt.]

Incombustible Thatch.—It has been proved by repeated experiments, that straw saturated with a solution of lime, or common whitewash, is incombustible. This fact is of great importance to the rural population, especially as thatch is thus not only rendered fire-proof but more durable.—*J. Mc I., Hillsborough.*

Melons.—As some gardeners are anxious to grow Melons early, I beg to state that after having tried the Kew Cantaloupe and Carton's Early Cantaloupe, I find Cuthill's Early Scarlet to be earlier than either. I cut one of these here on 13th April, and another on the 27th of the same month; the latter weighed 1 lb. 15 oz., and was exhibited by H. Villebois, Esq., at the Regent-street rooms in May, 1842. I also cut the same kind of Melon last year in the second week in May, and the plants promise to do equally well this season.—*C. M'Gregor, Marham Garden.*

Edgings.—Amongst the different edgings recommended I have not seen the common Heath noticed; in a dry peat soil this is a very neat and convenient edging, and is especially useful when Box will not grow well; it has been introduced with peat with success in the gardens of the Speaker at Heckfield Lodge.—*Totty.*

Potatoes.—In accordance with the directions given in the *Chronicle*, I tried the possibility of procuring fresh Potatoes in the open air in the months of March and April. In this I was so successful, that, from tubers planted in July last, I had good dishes of new Potatoes on Christmas day, and up to the first week in February. Of these, I sent three-quarters of a peck to Norwich market, expecting a high price would be given for such rarities, but, to my disappointment, I was informed that "Sprout Potatoes would not sell!" it was said, they were of too dark a colour to be new Potatoes. How is this to be remedied? they are fair as May roots, when properly boiled.—*M. G.* [Will any of our correspondents answer this?]

Icehouses.—As there was much discussion on the different kinds of Icehouses last year, ask your correspondents to give us their experience as to any they constructed. I thatched a large mass of ice in a sloping bank and well drained it; but either from the soil being damp, or from some undiscovered defect in the thatching, it was all melted in the early part of May. We have had no account of what success your readers had in the cultivation of the Courge courcelle.—*Totty.*

Societies.

ENTOMOLOGICAL SOCIETY.

Monday, Feb. 5.—H. Newport, Esq., President, in the chair. Messrs. Spence, J. E. Gray, Yarrell, and Waterhouse, were announced as having been elected Vice-Presidents, and Mr. Newport re-elected as President. Mr. Rich exhibited several species of the large Beetles of the genus Goliathus: amongst them were G. Drurei, G. polyphemus, and others. Mr. Bond exhibited a specimen of Pontia Rapæ, which was taken alive during the past month. Mr. Doubleday exhibited several Lepidopterous insects from Mr. Barnes' collection of North American insects, and pointed out the identity of several forms with British species, and others closely resembling British forms, although specifically distinct. The President exhibited a living specimen of Hypæna rostralis, which he had kept in his possession since September last, and which during that period had had no food. M. Des Vignes described

several species of Dipterous insects in the late Mr. Barnes' collection, which were indigenous to Great Britain. A paper was read from Professor Erichsen, of Berlin, describing several species of the genus Paradiseus, belonging to the Lamellicorn group of Beetles. A letter was read from Dr. Savage, giving an account of some Goliath Beetles, which he had collected: amongst these were two pairs of the G. quadrimaculata, and a specimen which Dr. Harris had pronounced a new species, closely resembling G. polyphemus. A description of some species of Leucanidæ was also read from M. Guerin Menèville. The Secretary read a letter from Mr. Melley, in which that gentleman had made some inquiries with respect to the insects that attacked the excrement of domestic animals that was used as a manure. He wished to know what species of insects attacked the excrement. Whether their attacks were prevented by spreading it immediately, and whether any advantage was gained by placing the excrement in water and then spreading it, and with regard to insects that attacked the roots of plants, whether they could be destroyed by irrigating the crops which they attacked. Mr. Westwood said that, in reply to this letter, he had stated that the species of insects which attacked the excrement of animals belonged to the families Geotrupidæ, Staphylinidæ, and Sphæriidæ; that it was probable they consumed but little of the manuring principles of the excrement, and that irrigation would probably fail to affect insects that attacked the roots of plants. A long discussion followed, in which Messrs. J. E. Gray, Walton, Marshall, Westwood, Waterhouse, and the President, took part, from which it appeared that insects might consume those principles of excrementitious matter, which were of importance to plants, as food; that, as long as insects were destroyed in the larva state, this was of little importance, but that if allowed to attain their perfect state, the manuring power of the excrement would be reduced; and that the best way of preventing the attacks of insects was as quickly as possible to collect the excrement of animals into heaps, as insects only attacked the surface. Mr. Waterhouse remarked, with regard to applying water for the purpose of destroying insects, that this would be more effectual in the perfect and larva state of the insect than in the pupa state, and thus the season at which water was employed would be of great importance. The President announced that the Rev. Mr. Hope had offered two prizes of five pounds each for the two best papers—the one on vesicatory insects, and the other on a subject not yet named.

Reviews.

An Inquiry into the Nature of the Simple Bodies of Chemistry. By David Low, Professor of Agriculture in the University of Edinburgh. 8vo. 1844.

The science of Chemistry is generally considered to be purely experimental, because though every new fact adds to our store of knowledge, and brings us nearer to the comprehension of those forces which regulate the transformation of matter, yet it is wholly impossible to argue from the known to the unknown; *à priori* reasoning has no weight with the Chemist, and though theory may be useful to guide him in experiments, it must never be permitted to bias him in the conclusions he draws from facts. The work of Professor Low is an attempt to establish a new chemical theory, "that all so-called simple bodies are compounds of oxygen and hydrogen;" but it is unsupported by experimental evidence of any kind. Chemists are in the habit of terming those forms of matter which they are unable to resolve into simpler substances, *elements;* and the term is correct, inasmuch as they are the elements of other substances. But it certainly does not follow that they are not compounds themselves. Nevertheless, so long as we do not know of what they are composed, or how to prove that they are compounds—in short, until we have experimental evidence of such being the case, we are not justified in regarding them as compounds, even though we may think it very probable that they are. Professor Low's arguments are ingenious, but they are those of a metaphysician, and not of a Chemist. He has followed out in part the views of Dr. S. Brown, with regard to the possible existence of the same kind of matter in different forms, and possessed of different properties. Much more must be done in Chemistry before such generalisations can be usefully made. It would be easy even now to make many theories as to the possible composition of the so-called simple bodies quite as satisfactory as that of Mr. Low, but we doubt whether it would at all advance the science. Facts, not theories, are wanted; and if we do form theories, they must be founded on facts; whereas the speculations of Professor Low are founded wholly on theoretical views.

Miscellaneous.

The Franconia Raspberry—its Hardiness, and its Value as a Forcing Variety. By A.—This shrub has been cultivated at Salem, in America, for several years: the first winter they were covered; the second year one half of the plants only were protected. Those left exposed to the winter bore as well, if not better, than the protected ones, and appeared in perfect health the summer following. This year the bed contains about one thousand stems, after pruning out; every one in sound condition, and wholly exposed to the winter, which has been a very trying one. Other beds, in different locations, were left unprotected the past winter, and have proved perfectly hardy. If it is unnecessary to protect them, there is a saving to labour in spring and autumn, seasons of the year when gardeners are very busy. Any one in the country cultivating them by thousands, can the next winter leave a part, in an exposed situation, unprotected, and prove the thing. It may be that the protection afforded by houses in the city may be sufficient, and the plant be killed in the open field. They also force well. I tried a few pots of them in the greenhouse, last winter, with different treatment. The result was in favour of those grown in the greatest heat, with a dry atmosphere, and watered with carbonate of ammonia, in the proportion of three hundred parts water to one of ammonia; next, those watered with liquid manure; and last, those watered, simply, which were nearly a total failure, the fruit not swelling off. They were taken up with a ball of earth, before severe frost, and all put in same sized pots, with as much rich soil as could be added.—*Hovey's Magazine of Horticulture.*

China.—Advices have been received from Mr. Fortune, engaged in collecting seeds for the Horticultural Society in China, dated Chusan, Nov. 12. He describes the whole coast of China to the northward as consisting of bare rugged rock, barren sand, and burnt gravelly clay, but with beautiful plants here and there. He had met with very bad weather in his passage to Amoy, but had had an opportunity of exploring the islands of Koo-long-soo and Amoy. On the voyage thence to Chusan, the vessel encountered heavy gales in the Formosa Channel, and was twice driven back, once to Chinchen, and once to Chamoo; this, however, gave him the opportunity of landing at those places, and exploring the country for several miles inland. On no occasion had he met with serious obstacles to penetrating the country, but, on the contrary, found the natives particularly civil, much more so than on the coast further south and at Canton. Mr. Fortune had fallen in with hills covered with Azaleas, and with several other good things, seeds of which, in very small quantities, were inclosed in his letters. In particular, he had met with a very beautiful Buddlea, with rich purple flowers, arranged in clusters like a Lilac; and a very fine Campanulaceous plant, with flowers as large as those of Lisianthus Russellianus. What he had seen of China gave him great hopes of fully realising the anticipations of the Society. He was about to proceed to Shang-Hai and Ning-po.

New Zealand Resin.—Dr. R. D. Thomson has published an account of the resinous exudation of the Cowdie Pine, from which it may be inferred that it deserves attention as an article of import. It is a very hard transparent substance, in the state in which it arrives in England, and has long ago appeared to us likely to prove valuable as an ingredient in varnishes; but it was found difficult to dissolve it. Dr. Thomson has, however, ascertained that it may be dissolved in hot *absolute* alcohol and in oil of turpentine.

Mexican Poison, Guaco.—Dr. Uslar, of Oajaca, in Mexico, states in a letter that he has investigated the nature of the celebrated Mexican poison, Guaco. He speaks of its medicinal properties as powerful, and hopes European physicians will investigate its powers. He is of opinion that the plant which produces the poison is a species of Convolvulus, and not the Mikania Guaco, as is usually supposed. He doubts altogether the active properties of the Mikania, which also accords with Hancock's opinion.—*Bot. Zeit.*

Lemons—Himalayan method of Keeping.—"Five dozen Lemons were bought in the bazaar (Srinagur) for about fourpence; six of them, taken indiscriminately from the basket, weighed about five pounds. It is customary to pluck the fruit when it has attained its full growth but is not quite ripe. It is then buried in deep holes in the ground, lining the pits and covering the fruit with dry leaves. In this situation it attains maturity, and if not bruised in packing, retains its form and freshness for a considerable period. I saw some disinterred, after they had been buried for three months, and they were in the most perfect preservation."—*Moorcroft's Travels*, vol. i. p. 55.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Many plants will soon be fit for repotting. When plants are removed to a higher temperature, examine their roots, and see if they are healthy, and if not, shake the old soil from them, and repot them in fresh soil into smaller pots; this is a good mode for preparing plants for the one-shift system, which may be adopted as soon as the roots begin to spread on the outside of the new soil. The one shift should never be adopted until you are satisfied that the roots are in a healthy state and beginning to grow. There is no time when a low night temperature is more necessary than during the next six weeks, as plants are now more easily excited than at any other period.

Conservatory.—Orange-trees, if now removed to an early Vinery or stove, and kept in doors all summer, will come into flower next Christmas with very little forcing. Camellias that have not formed flower-buds may also be introduced into heat in succession from this time; some of them may be expected to flower about the middle of next September. I had some treated thus last year, and they began to flower at that time. Plants of the Fuchsia corymbiflora which were cut back last autumn to the ripened wood, and preserved in any outhouse through the winter, will flower in May if they are now removed to a Vinery or forcing-house. The night temperature of the Conservatory should now be lower than through the winter, say about 40°, in order that the plants may be started away slowly at first; this should be attended to now by all who regard the proper cultivation of their plants.

Greenhouse.—If you guard against frost, there is no danger of this house getting too low in temperature, and air should be freely admitted every fine day, in order to keep the plants from growing too rapidly at this season. Owing to a drier atmosphere being thus produced, the plants in this house will require constant attention with regard to watering.

Forcing pits.—That variety of the common Lilac called Charles the Tenth is the best of them for forcing, as it retains its high colour better than the Old Purple one; and if it was grafted on the Persian Lilac it would check its vigorous habit, and render it more manageable as a pot plant. Has the Double Sloe been submitted to forcing by any one? It would make a good contrast with such plants as the Double Dwarf Almond and the Double Chinese Almond, the Rhodora, &c., all of them flowering before their leaves appear. About the same treatment as that for forcing Peach-trees will suit them; and, being naturally early bloomers, they are good plants for forcing. A steady bottom-heat, a moist atmosphere, and attention to cleanliness, are the chief requisites in early forcing flowers.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

As soon as the ground is a little dried it will be a good plan to have all the vacant beds in the flower-garden forked over, so as to get the soil properly pulverised prior to planting out the autumn-sown annuals. Preparation must also be made for a general sowing of the more hardy kinds, such as Larkspurs, Godetias, Clarkias, Nemophilas, &c., which should be got in the first day the ground is sufficiently dry to admit of sowing them. Proceed with the pruning of Shrubs and common Roses, but leave the more tender kinds until you are sure they will not be injured by frost. The most tender of the Chinese varieties, that were covered in autumn with leaves are in excellent condition, and I expect to carry them through the winter without losing a twig.

Reserve Garden.—See that the plants in this department are not thrown out of the ground by the late frost. If they are loose fasten them. Proceed with planting out biennials as soon as the ground is in a fit state, and prepare a little ground in a warm corner for sowing Stocks and some of the best of the annuals for transplanting.

Pits and Frames.—Here there will be no want of work for the next three months. Some of the Stocks and other annuals sown some weeks back will require potting off, putting 3 or 4 plants in a pot. Pot off Verbenas, &c., put in cuttings of all kinds which you are deficient in. Divide and make root-cuttings of Bouvardia triphylla and angustifolia, and get the plants forward and strong for planting out. Put Salvia patens into heat to produce cuttings, and see that everything is in order for the spring, which will soon be upon us.—*W. P. A.*

III.—FLORISTS' FLOWERS.

As a matter of course all Floricultural Calendars must to a certain extent be acted on only as the weather is favourable for the operations there detailed as necessary. During spring and summer, the experienced Florist finds it comparatively easy to point out the previous week what is requisite to be done the ensuing one. But at this uncertain season we must be guided by circumstances. Whilst writing, the frost appears to be rapidly disappearing, it will therefore cause the Florist to be on the alert, and if the weather continues mild, draw the lights completely off the Auricula frames during the day, examine the plants minutely, and see that all is going on well. Should any mild rain fall during the week, they will be benefited by a good sprinkling "*in the middle of the day*;" when the lights are drawn on tilt them, so that the grass may get as dry as possible before night.

Carnations.—The same observations will apply to these flowers and carefully remove all spotted or diseased leaves.

Tulips.—Still cover with sand as they appear.

Ranunculuses.—Should the beds get sufficiently dry, they should immediately be planted; we usually plant two very large beds, one in about ten days or a fortnight after the other; this gives a competing Florist a better chance, besides prolonging the season of bloom in his garden.

Dahlias.—Still strike cuttings in moist heat as they get long enough.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Where Pines are extensively grown, it would be inconvenient to examine and repot them a few at a time, as they want it; and as the plunging material will now require some addition to keep the bottom-heat to between 80° and 85°, it will be better to have a general arrangement of the whole stock of successions in pots whenever the weather is favourable. Those Plants intended for fruiting in the autumn should be carefully examined, and if the roots are not healthy, or the soil has become close, a partial or entire removal of both, as may appear requisite, should take place. In repotting, the size of pot must be determined by the sort of Pine and condition of the plant. The Montserrat, Jamaica, and some others, make fewer roots than the strong-growing Providence, Enville, and Queen, and consequently require less pot-room. If it is intended to plant them out as soon as it is ascertained that the fruit is formed, smaller pots may be used than if the plants had to mature their fruit in them. In potting, use some Moss over the drainage, and sprinkle a handful of soot over the Moss, to keep out worms. Those of the younger successions that are in good condition at the root should have a good shift, as they will fill a large pot by Midsummer, and the less they have to be shifted, the fewer checks they receive. If the heat in the bed at a foot from the surface is about 80°, do not use much fresh material, as the heat from the sun will soon begin to act upon the bed, and it will be better to have to add a little more round the outside pots in a month hence if necessary than to run any risk of injuring the roots by an over-degree of bottom-heat.

Vinery.—From the time the fruit-bearing shoots are far enough advanced to be stopped, the temperature should be fully 75° by fire heat during the day, letting it fall towards evening, and keeping it as low as 60° during the greater part of the night. This treatment of the Vines should be strictly observed, as they will be more healthy from it, and the crop about as early as if a higher night temperature were kept, and it will be found more economical. The Vines grown in Pine-stoves, and indeed in Vineries also, will be benefited by tying Moss round the old wood, as it will keep them moist and cool, and the sap-vessels expand better than when exposed to dry heat.

Peach house.—Where the fruit is swelling, the night temperature should be about 60°, and 70° to 75° during the day, by fire-heat. Give air when the sun raises the thermometer to 80°. Careful attention to temperature and syringing will, in most cases, keep down insects; but where this fails, fumigating should be had recourse to. The most effectual way of destroying green-fly by fumigating is to fill the houses moderately on two successive evenings.

Cherry-house.—If the Cherries have set numerously, and are so far advanced as to show which are the most promising fruit, thin out the smallest. Weak liquid manure may now be given with advantage to the plants in pots.

Melons.—For a moderate-sized frame, one plant under the centre of each light is sufficient; but if two are preferred, plant them 15 inches apart lengthways of the frame. In preparing for planting out Melons in pits of a good width, it is better to put the plants within 18 inches of the front-wall, and train them on a trellis towards the back, 2 feet from the glass. Fill the pit to within 3 feet of where you intend the surface of the mould to be with tan or leaves in a fresh state, then lay 6 inches of decayed leaves and dung upon it; then form a ridge along the front of turfy loam, with a portion of burnt marl and charcoal for turning out the plants upon, leaving the remaining space to be filled up at intervals. The plants, when turned out, should be 2 feet from the glass.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Grafting.—Where there are inferior sorts of Apples and Pears, or too many of one sort, procure scions of superior varieties, and keep them till wanted in a cool situation.

Cucumbers.—Sow seeds, or procure a few plants from those who force early. A Cucumber that grows quickly, fruits plentifully, and eats crisp, is to be preferred, where exhibition is not an object. The temperature should range from 68° to 73°, allowing 5° more for sun-heat. If the condensed water on the sash-bars is of a pure colour there will be no danger from rank steam.

Celery and Cauliflowers.—Sow in a slight hotbed; the latter to succeed those sown in the autumn. A pot of Celery may be put into the Cucumber frame, as a little will require to be sown thus early if fine heads are expected in September.

Potatoes.—Plant in frames, and forward tubers by putting them in any warm place, for planting under straw covers and hurdles.

Peas and Beans.—A sowing of these will require to be made as soon as the weather will admit.

Shallots and Garlic, if not done in the autumn, should now be planted the first opportunity, digging the ground deeply, making it fine and just fastening the bulbs on the surface.

Cabbage.—Where there are not plenty of autumn-sown ones, sow some on the warmest border you have, or in a carrot-frame.

Onions and Carrots.—The ground intended for these cannot be too often turned after these frosty mornings.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Attend to former directions respecting the work that is necessary to be performed. It would show care, and add much to the beauty of trees if all rotten branches and split boughs were removed, and evergreen shrubs planted under the trees; young Firs, such as Silver, Spruce, and Hemlock-leaved Spruce, to be headed off at a proper height, might also be planted as underwood; this may be done by having a cart filled with good rich compost, mixed with leaf-mould to put over the roots when planting. By this means most kinds would succeed, and render the woods much more cheerful in winter.

Coppice.—Forward all necessary works when the weather permits. Having omitted formerly to mention the distances from each other at which Coppice-wood should be planted, I would recommend planting them at about four feet apart each way, as it will be advisable to have plenty of stools to choose from, as some will grow faster than others, and some may fail. In forming a new Coppice, I would prefer planting in masses, each kind by themselves, according to the soil and locality. They would have a better appearance, and it would prevent some kinds from overgrowing others and injuring them, besides it would be more convenient, when cutting, to have each kind separate. I also omitted to mention Birch, and some kinds of Willows, as being very profitable and useful copse-wood, along with Oak, Ash, Hagberry, or Bird Cherry and Hazel, as being the most useful. I may also venture to recommend the Locust-tree in favourable localities The Hazel might be mixed with tall-growing trees, to draw them up to a greater length.

Young Plantations.—Too much care and attention cannot be bestowed upon these during the early periods of their growth, for all their future value depends upon this A few trees will naturally take the right way, having a proper proportion and equality of side-branches, with only one leader, but for one of these there are scores that require timely and skilful training to keep them in right order.

Hedge Rows.—It is much to be regretted that there is so little attention paid to the proper training of trees in hedge-rows, which might be made useful and ornamental if a little care was bestowed upon them.

Nursery Work.—As the weather continues unfavourable for many operations in this department, all works that can be forwarded with advantage should be proceeded with, to be ready for the more active operations of planting and sowing, when the weather becomes more favourable.—*W. B.*

State of the Weather near London for the week ending Feb. 15, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 20th and 21st, 1841—thermometer 56°; and the lowest on the 20th, 1836—thermom. 19°.

Notices to Correspondents.

Our Correspondents will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

Communications from the following **Correspondents** are in type, and are only waiting till room can be found for them:—*M. G., J. B. K. L., Nemo, J. Wighton, A Practical Man, Peter Mackenzie, Martin Doyle, A Bee Preserver, C. A. A. Lloyd, G. Thompson, W. Billington, O., Vitis, Q., J. Spencer, R. Errington, Gr., J. M'L.*

Abutilon striatum.—*Proteus*—This plant is a native of Brazil, and produces its pretty bell-shaped flowers, of a bright yellow strongly veined with scarlet, for ten months in the year. It likes a moderate supply of water when growing. The temperature for it may be that of the open air in summer—about 75°, at most. The kind of soil to grow it in is not important, but it must be allowed to have plenty of pot-room for its roots, or it loses its leaves at bottom, and becomes naked and unsightly.‡

Charring.—*O.*—Sods put on a hotbed, and sticks inside it, may be greatly reduced, but cannot be considered charred by any such operation.

Deodars.—*Govyn.*—Place cuttings of the half-ripened wood, with the points cut off, under a handglass, in a very little bottom-heat, and they will strike root.

Emigration.—*A Poor Cabbage* will do better here in a comfortable place than in the United States or anywhere else. We do not admire the land of repudiation, and cannot recommend any one to go to a place where swindling is the national characteristic. If *Cabbage* is in such a state of fermentation that he cannot remain as he is, then he had better try Canada or New Zealand, provided he has some money, some patience, and a great deal of energy. Any place, however, is better than one where you have a large garden, 1000 pots, 140 succession Pines, 120 fruiters, Peach-house, Vinery, pleasure-ground, and kitchen-garden, with only one man, who is often absent six weeks at a time. If there is such a place, we can only say that the master ought to be his own slave; and if gardeners would take our advice he should be so.

Exhibitions.—*An Exhibitor.*—It is rather a nice point whether Clematis Sieboldi and azurea grandiflora can be called greenhouse climbers or not. They are certainly hardy, but they thrive much better in a greenhouse than out of it. You had better inquire of the secretary what the practice is of the Society where you propose to exhibit.

Florists' Flowers.—*Warwickshire.*—Your Chinese Primrose looks like a half-bleached variety of the dark-red notched kind. The specimens are much withered; possibly as there are very few varieties at present of this plant, that you have sent may be worth keeping.

Fumigation.—*Oliver.*—Your question should have been addressed to the "Pharmaceutical Journal." According to the archives of Pharmacy, a sweet fumigating inflammable fluid is prepared by mixing together 48 oz. spirits of wine, 4 oz. Tinct. Benzoin, the like quantity of Tinct. of Vanilla, of Acetic Ether, and Oil of Bergamot, each 1 oz.; 2 oz. Oil of Cedar, ½ oz. of Tincture of Musk and of Peruvian Balsam; Oil of Mace, Oil of Cloves, and Oil of Cassia, each ½ an oz. We cannot again answer such questions as this, which have nothing to do with the subject of our Paper.

Gurkens.—*J. B. K. L.*—The little prickly Russian Gurken is often used in pickles, and it is always distributed by the Horticultural Society; but, from the description given by a late correspondent, we suppose that he meant the Cucumis prophetarum, a bad material for such purposes. C. Anguria is also used in the same way, but is equally objectionable.

Heaths.—*Dianthus.*—These are best struck early in autumn, but they will do now. Put them in silver sand under a bell-glass, and wipe it out every morning and evening. We never saw cuttings of forced Pinks used, and should doubt whether the practice is worth attempting.

Hawker's Licence.—*W. K. I.*—Garden seeds cannot be carried about the country and sold from door to door without a hawker's licence. Every hawker, pedlar, &c., must pay a duty of 4*l.* for each year; and if he travel with any horse, ass, mule, or other beast drawing burthen, the additional sum of 4*l.* yearly for each such beast.

Holly-berries.—*A Subscriber.*—Of your Holly-berries that were mixed with sand and buried this winter in the ground, if sown in March, a few may come up during the summer; but they will not grow, generally, before next season.‡

Insects.—*A Subscriber's* Scales from the Peach-tree appear to be the Coccus patellæformis—*Gard. Chron.*, vol. iii., p. 517; the smaller ones running about are the young of the same, but it is very probable that a smaller *species* may also infest the Peach-tree. *R.*——*O.*—We doubt whether guano sprinkled among compost will kill wireworm.——*J. D.*—No. 1 is closely allied to the Coccus Testudo, of Curtis, and thus are probably identical; 2, is a Lepisma, but I neither know the species, nor can I say upon what it feeds; 3, is Aspidiotus Bromeliæ, of Curtis; 4, is a young Helix; 6, the leaf has probably been punctured by an exotic Thrips. The box No. 5 was crushed and empty. Pill-boxes, unless cut down and well made, will not bear the pressure by post, and the stamping at once destroys them. If a pill-box be cut down to the depth of half an inch, and a slice of cork of the same thickness, but very much smaller, as the cork of a vial, be stuck in the centre with sealing-wax or a wafer, the lid and bottom will not sink in, and there will generally be plenty of room left round the cork for specimens; for the same reasons nothing can be worse adapted for transmitting fragile or living objects than lucifer-boxes, which are often employed. For small insects the barrel of an old pen or a quill stopped at both ends with cork, is an admirable protection per post. As the period is now approaching when we expect to be favoured with numerous specimens both from the Gardener and Farmer, we hope our recommendations will be adopted, that specimens may arrive safe, and enable us to give satisfactory answers.—*R.*

Lawns.—*F. R. S.*—A good kind of Grass for improving a lawn is Crested Dogstail; it may be sown in March. The common practice is to bush-harrow the lawn in order to stir up the soil a little for the seed, which should be sown broad-cast when the ground is damp, passing a garden roller over it when the ground becomes sufficiently dry.‡

Luculia gratissima.—*Rhodon.*—This is an excellent Conservatory plant, but we never saw it tried in a window; it succeeds well in a mixture of turfy loam and peat. It may be propagated by cuttings, which require bottom-heat.——*W. C.*—It is not a climber, but a beautiful greenhouse shrub, with large fragrant blossoms, having some resemblance to those of a Hydrangea.‡

Manures.—*Ignoramus.*—Charcoal seems useful for everything; the softer it is the better. We know nothing of the action of Potter's liquid guano; but his common guano is so very good that it is worth trying the other. Nothing that we have seen acts on Pelargoniums like superphosphate of lime.——*O.*—We never heard of Rushes being used as manure for Auriculas. Bran, soaked with soapsuds, which has lain two years or nearly, although not reduced to a soil, is fit for use. Kill the small dingy-coloured worms, by moistening it with boiling water.——*A Lady.*—Nitrate of soda is no doubt useful to greenhouse plants if mixed in the water used in watering them. The weaker the solution the better. Instead of 2 oz. to 6 gallons of water we should only use half as much, or even half that, and trust to the quantity that will be given by slow degrees. A much better material is Potter's guano or superphosphate of lime. If you love your plants they will take it kindly of you to give them some.

Morphology.—*E. B.*—We are much obliged for your very sensible letter; but we make a point of not coming into contact with such people as those to whom you allude. It is true that the criticism is "a production which for egotism, ignorance of the subject-matter in dispute (?), and illiberality, cannot be paralleled in the whole range of English literature," and for that very reason it is beneath even contempt.

Names of Plants.—*Cork.*—If you will again refer to p. 71, you will see that the account of Statice rytidophylla is a mere extract from the "Botanical Magazine," with which we have nothing to do. Your leaf is surely not it, but seems to be S. oleifolia, or some such species. S. Dicksoni, or Dickensoni, is in the way of S. arborea, and is the same as S. rytidophylla. ——*G. B.*—1. Cineraria Tussilaginis var.; 2. Erica gracilis; 3. Indeterminable; 4. Ditto: perhaps Bignonia pandoræ; 5. Lavandula dentata; 6. Indeterminable. Plants out of flower cannot often be named with any accuracy.——Δ—One of your Begonias is coccinea, the other has no good flowers, and we do not recognise it; the plant called Hibbertia is Pomaderris elliptica.——*W. M.*—Your Gesnera, which looks like a cross between G. Douglasii and bulbosa, is handsome and new to us. ——*S. H.*—1, Carex fulva; 2, Scirpus sylvaticus; 4, Blechnum boreale; 5, Asplenium ruta-muraria; 6, A. adiantum nigrum; 7. Polypodium vulgare. §——*Tropical.*—Next week.

Oaks.—*Crustyman.*—There is no good reason to suppose that Wainscot Oak is produced by the Quercus Cerris. It is probably the wood of Q. sessiliflora run up in the close forests of the Continent.

Peach-trees.—*A New Subscriber.*—Your Royal George Peach-tree has been planted in soil too highly manured. You must manage it in summer in such a way as to have no occasion to cut out over-luxuriant shoots in winter. Much cutting will increase the tendency it has to gum and canker. Withhold manure from the border till such time at least as the tree begins to bear.‖

Peas.—*A Subscriber.*—The Pea you sent of the variety which grows with you to the height of 9 ft., and which you say is the best tasted of any you have ever met with, continuing in eating when other Peas are hard, is Knight's Tall Marrow.‖

Pears.—*J. W. T.*—On your three worthless Pear-trees on a north wall, you may graft for fruit to come in between January and March, Hacon's Incomparable, Ne Plus Meuris, and March Bergamot; but early varieties are more appropriate than late for such a situation. Grafts from the garden of the Horticultural Society cannot be obtained except by Fellows of the Society.‖

Pine-apples.—*X. Y. Z.*—We do not advise you, as a novice in Pine-growing, to attempt them out of pots. Try that way first, and when you have become acquainted with their pot management, then turn them into a bed of earth, warmed by hot-water gutters. Soil is of less consequence than good management. See what is said on this subject at p. 19, of the present volume.——*J. B. K. L.*—The instance you mention is noticed to-day. It, however, was not a Queen Pine, but a Providence, which is a very different thing.

Pits.—*An Irish Economist.*—Mr. Paxton's plan of a pit is only for its construction and not for heating it. It need not be heated at all, or it may be warmed in 20 different ways. Our columns have, of late, been occupied by descriptions of heating, all of which are, no doubt, more or less good. Will none of them suit you? We fear clay pipes will not answer. Some say they do, but in our experience they do not. We cannot give plans of boilers; that is the business of those who sell them. Rogers's conical boiler is a truncated hollow cone.

Polyanthus.—*O.*—The florists who use for these flowers the soil in which Cowslips grow, do so upon the supposition that plants know better than we do what they like; and no doubt florists are right. The Polyanthus and Cowslip have exactly the same habit and constitution.

Potatoes.—*Arglos.*—Lime is a good manure for Potatoes. If you can get lime-rubbish, so much the better. We should give the land a good dressing—say 20 loads an acre of lime now, and stable-dung at the time of planting. You would no doubt, however, find your account in using a few bushels of Potter's guano instead of lime. It costs more, but produces more! and then you may sell the stable-dung.——*Ignorumus.*—Nothing will make Potatoes mealy that are grown in the shade. They *must* have light, and plenty too, if they are to be of good quality.

Potted Plants.—*O.*—When pots are lined with moss the young roots are entangled in it, and hold the soil together, so that shifting may be easily accomplished. Or, if sphagnum moss is employed, it keeps the soil damp. Half-decayed woollen rags would probably be useful in potting, but we never saw them tried.

Pruning Forest-trees.—*Dendrophilus* will appear shortly. We have already so fully and repeatedly expressed our own opinion on this subject that we cannot undertake to renew it again speedily. Col. Greenwood's new book will, however, probably lead to some discussion.

Raspberry—*T. P.*—We will inquire.

Stakes.—*Midland County.*—Point and char your Larch poles, by all means, before you drive them. But did you not see what was said in our last Number about Seyssel asphalte for this purpose? There is no object in putting them in round. If driven close together, and secured by a lath nailed to the top, they make the best of all hare-proof fences.

Sugar-bakers' Scum.—*Opus.*—We regret to be unable to give you any information concerning the action of this substance. It is reported to render Grass very rank, which is quite in its favour; and it is said to be good for Turnips; but we can get no satisfactory intelligence upon the subject. Our correspondents would much oblige us if they could furnish some information respecting it.

Timber.—*E. H. L.*—Larch-poles, of 6 inches average diameter at the largest end, are worth about 2*s.* 6*d.* each in London, Good Oak is worth from 5*d.* to 7*d.* a foot superficial in the inch, which must be what your sawyer means, and not 8*d.* a foot for the ¼ inch. English Oak is worth from 6*l.* to 8*l.* per load, according to quality. We will take measures in a week or two to publish the London prices of English timber, and continue to do so from time to time.

Vines.—*G. M.*—Having two small Vineries to furnish with 7 plants each, you may plant in the early one, 3 Black Hamburgh, 2 Royal Muscadine, 1 White Sweetwater, 1 Black Prince; in the late house, Black Hamburgh, 2 Charlesworth Tokay, Muscat of Alexandria, 3 St. Peters. For fruiting in pots, Black Hamburgh and Royal Muscadine. ‖——*A. B.*—It will be advisable to manure your Vine-border with superphosphate of lime. Let the roots be kept dry in winter, but moist in the growing season; the reverse of this is most probably the cause of failure as regards your crops of fruit. If in consequence of its being situated near the house, you prefer having the border neat and rather gay during the summer, you must select such plants as will neither root deeply nor overspread the surface, and they should be thinly planted.‖——*Emily.*—A fall of 18 inches on a width of 4½ feet will be quite enough for your verandah, especially as you intend to have it glazed with British sheet-glass; and if you do so, there will be very little risk of damage from hail-storms. Vines will succeed if planted to grow up the supports in front, and trained under the glass. For this situation, the Black Hamburgh and the Royal Muscadine are most suitable varieties.‖

Vines in Pots.—*Peter C.*—Vines for early forcing may be coiled once round with some advantage, because a store of perfectly-elaborated juices is contained in the mature wood; which will prove useful in forming leaves in the first instance. But it must be borne in mind, that if a great length of wood is coiled in the pot, a large portion of the returning sap from the recently-formed leaves is appropriated by such great bulk of wood, and the latter gains an accession of tissue from that which would otherwise have gone to the formation of fresh roots. The Canes should be potted in January, and brought gradually forward, so as to break the buds before March, when sufficient light will be obtained for the expanding foliage; after which there will be a long enough season to prepare them for fruiting next summer.‖

Whitney's Transparent Fluid.—*X. Z.*—The following is Mr. Whitney's answer to your inquiry:—"The calculations I made, and which I still adhere to, was on *glazed calico*, which I have found to take as nearly the quantity specified as possible; but I find that different materials require larger quantities of the composition to render them waterproof. Book muslin takes considerably more than glazed calico, as all the compartments of that thin fabric must be filled up. Very thick calico without glaze also takes more to saturate it, for which reason I have particularly recommended that parties should use glazed calico, and apply the composition on the side *not* glazed. Your correspondent must have omitted to read the directions, or he would then see that the composition is to be put on *hot*. I have no doubt, however, that when his calico is dry it will be perfectly impervious to moisture, and I should be inclined to let it stand the summer, and give it a coat in autumn, if to remain out all the winter."

Miscellaneous.—*T. S.*—We know of no proportion for mixing oil, &c. for white paint; your own observation will tell you when it is of a proper consistence. If yours rubs off like whitewash, it may be because you use bad oil; but it is more likely to arise from using bad white-lead, which is often adulterated with common whitening. Get good materials, of respectable people, who do not profess to sell cheaper than they *can* buy, and your paint will be as good as your neighbours'.——*J. B.*—You may plant a Pyracantha, or a Chimonanthus, or a common Laurel, or an Alaternus, or a Phyllirea. We should plant the first. Violet-seeds cannot be readily bought. Why not get the wild sorts out of the woods? none are sweeter. They may be planted now, and will blossom soon; but we doubt if they will succeed. Better try Periwinkle and Lilies-of-the-Valley.——*Uckfield*—We are in possession of an answer to your question from "O." that will be forwarded to you upon your giving us your real name and address.‡——*R. L.*—Address, "The principal Superintendent of the Gardens, Hampton Court."——*Este.*—A book is at the office for "Este."——*Alpha* will find directions for the management of the Tuberose given at p. 149, 1843. ‡——*Theta.*—We do not know where seeds of the Sirdar Melon may be had. Your letter is sent to Mr. Fleming. ‡——*A Constant Reader.*—The term struck hive in the article on Bees was misprinted for sticked hive, or the hive with sticks in it. Your other questions will be answered by Mr. Pettigrew himself, to whom your letter is sent. ‡

Erratum.—Feb. 3, p. 70, Polyanthus—for "fine-eyed" read "pin-eyed."

*** As usual many communications have been received too late for answering this week.

EXAMPLE FARM.

WANTED, to Rent on Lease, for a term of not less than 21 Years, to enter at Lady-day, a Commodious Dwelling-house, and about 120 acres of Arable Land, for the purpose of forming it into an EXAMPLE FARM. It must be near to a Railway station, and within 50 miles of London; on the greensand formation, under the chalk, or on the London clay or plastic clay above the chalk.—Apply to Mr. MORTON, Chesterhill, Stroud.

AGRICULTURAL SCHOOL.

MESSRS. NESBIT'S ACADEMY, 38, KENNINGTON LANE, LAMBETH, near London.—"From Chemistry alone further progress in Agriculture is to be expected."—LIEBIG. In this school, in addition to the general routine studies, every facility is afforded for the acquisition of a sound knowledge of Chemistry. The pupils are *practically* taught in the laboratories, the methods of analysing the various earths, soils, manures, &c.; and likewise the means of detecting the substances abstracted from the land by different crops. Land Surveying is also taught practically, as well as theoretically. A copy of a lecture on Agricultural Chemistry, delivered by Mr. J. C. Nesbit to the Maidstone Farmers' Club; and the terms of the school, which vary from 40 guis. to 70 guineas per annum, may be had on application, either personally or by letter.—Mr. Nesbit's Works on Land Surveying, Mensuration, Gauging, Arithmetic, English Parsing, Education, &c., may be had of all booksellers.—REFERENCES: Dr. D. B. Reid, F.R.S.E., &c., Author of "Elements of Practical Chemistry," &c., St. James' Park, Westminster; G. F. Richardson, Esq., F.G.S., Author of "Geology for Beginners," &c., British Museum, London; W. and J. Gibbs, Esqrs., Civil Engineers, Devonshire St., Portland Place, London: Rev. T. Cuffe, Carlisle Episcopal Chapel, Lambeth; R. Greenhill, Esq., Ashford, Kent; and C. G. Whittaker, Esq., Barming, near Maidstone Kent.

The Agricultural Gazette.

SATURDAY, FEBRUARY 17, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Feb. 21 . Agricultural Society of England.
THURSDAY, Feb. 22 . Agric. Imp. Society of Ireland.
WEDNESDAY, Feb. 28 . Agricultural Society of England.
THURSDAY, Feb. 29 . Agric. Imp. Society of Ireland.

FARMERS' CLUBS.

Feb. 26 { Chepstow. Fairford.
March 1 { Hadleigh. Wrentham. Debenham.
Feb. 29 Richmondshire.
March 2 { Collumpton. Cardiff. Gloster.

In continuing the observations we commenced last week, our object is, as it was then, to ascertain THE CHEAPEST WAY OF KEEPING FARM-HORSES; and we are now inquiring into the amount of labour involved in the use of various implements, merely because it is necessary to ascertain how far this affects the evidence offered by many, as to the sum total of the expense connected with horse-labour. It is necessary to know what portion of this sum may be owing to other points of farm management—to the adoption of particular implements, for instance—before we can determine what the tendency of this evidence is. The remark we made in our last *Gazette*, that the total expense of horse-keep incurred by the Berkshire farmer who uses waggons, might be much greater than that incurred by the Scotch farmer occupying the same number of acres of a similar soil, who uses carts, without there being necessarily greater economy in the stables of the latter, was not intended to justify the former in his practice; it was brought forward merely to show, as we have just said, to what an extent the expenses under this head depend on particulars not immediately connected with it; and we shall find that the form of the plough is one of the most influential of these particulars; that the difference in the power required for the performance of a certain amount of work with the cart and the waggon, is not greater than that in the power required to plough a certain extent of land with the various forms of the implement employed in different districts for the purpose.

We do not intend entering now on the subject of wheel and swing ploughs, either as to the quality of the work done by them, or as to the power required to draw them; it is sufficient for our purpose to show that, let the cause be what it may, there is a great difference in the force required to draw different ploughs, when opening furrows of the same dimensions in the same kind of soil. Mr. Pusey, who first directed attention to this subject, detailed the results of his experiments in the English Agricultural Society's Journal, and from his paper we have compiled the following table:—

POWER REQUIRED TO OPEN A FURROW FIVE INCHES DEEP AND NINE INCHES WIDE.

Name of Plough.	Sandy Loam.	Blue Clay.*	Loamy Sand.	Strong Loam.	Moory Soil.	Average.
	st.	st.	st.	st.	st.	st.
Ferguson's Improved Scotch Swing Plough	19	50	19	35	23	29
Clark's Improved Scotch Swing Plough	20	52	17	33	23	29
Hart's Improved Berkshire, one-wheel	14	43	12	23	16	21½
Ransome's F.F. two-wheels	14	44	13	33	14	23½
Do. do. Swing	18	44	16	30	21	26
King's Swing	18	48	15	27	19	25
Do. one-wheel	17	43	17	30	18	25
Rutland, Ransome's, N.L., two-wheels	17	50	16	36	21	28
Old Berkshire Wheel Plough	23	52	21	36	25	31½
Holkam Plough, two wheels	18					

* The furrow in this case was six inches deep on one side, but the furrow-slice was thrown downwards.

Here we see a great difference in the power required to draw these ploughs—such a difference, in fact, as would force the farmer who employed the one of greatest draught, to keep three horses for every two that were kept by the farmer who used that of least draught.

Mr. Pusey's experiments drew much attention to this subject, and many trials of ploughs have been made since those which he has recorded; the following results of some, which were superintended by the Ipswich and other farmers' clubs, are extracted from the "Farmers' Magazine."

Swing plough—the furrow 9 inches wide by 7 inches deep, down the field, and 9 inches wide by 6 inches deep, up.

Name of Plough.	Maker.	Draught down.	Draught up.
Swing plough, S. R. . .	Ransome	20 stone	22 stone
Do. do. F. F. . .	Do.	24 ,,	
Do. do. F. S. . .	Do.	25 ,,	25 ,,
Palmer's patent W. H. .	Wood	28 ,,	26 ,,
Wooden plough	Meadows	32 ,,	
Essex swing	Ransome	38 ,,	32 ,,

Here the difference in the power required to work the several ploughs is still greater than in the former instance. There cannot be a doubt that many farmers are, from this cause, unwillingly incurring greatly more expense in the cultivation of their land than others, who are careful to select easily-worked implements. The expense of cultivation in many districts is now, also, much diminished by the employment of scarifiers and cultivators in place of the plough; for the extent of land which can be *cultivated* in the course of the day is four times as much as can be *ploughed* in the same time by the same force.

Now, take all this into consideration, and compare two farmers: take the case of one who *carts* his manure to the field, and his produce from it—who, in preparing for Wheat or Barley, the land off which he has just harvested his Potatoes, Swedes, Turnips, &c., instead of ploughing it at the rate of one, or perhaps only ¾ of an acre a day, merely stirs the land with a scarifier or cultivator, which, with the same force, can be done at the rate of four or five acres a day—who, when he does plough, as in preparing the land for fallow crops, &c., uses an implement of the best sort, one combining lightness of draught with efficiency as a plough; and compare this case with that of another who carries his manure out and his crops home in waggons—who uses no cultivator, and ploughs his land with one of the heavy implements named in the above Table. Why, if the latter cultivates his land as well as the former, he requires nearly double the horse-power to enable him to do so; and no straining of economy in the stable will enable him to keep this greater number of horses at the same expense. Indeed, the former may be as economical in the stable as his neighbour, and then what a difference will their respective modes of management make in the accounts which they will render of the expense per acre at which they cultivate their land! Certainly, we shall have closely to examine the evidence on record, of the sum per acre to which the expense of horse-keep amounts on a farm, before, from a comparison of it with the modes of stable-management adopted by the several witnesses, we can determine what true economy in the matter is.

And here we must be allowed a digression, in order to point out the great national importance of this subject. The expense of horse-labour, putting its results out of sight, is a dead loss to the country,—as much so as if its money value were exported; and, in fact, taking its results into consideration, they are obtained in a manner as injurious to the interests of the British labourer, as if the work had been done by a sufficient number of the labourers of any other nation imported for the purpose. We are not, however, here advocating the performance of all Agricultural operations by the hand; it is the interest of the farmer to get his work done in the cheapest manner, whatever be the agent he employs; and as long as the land may be cultivated and crop harvested cheaper by horse-labour than in any other manner, so long will it be unwise to adopt any other plan; but the very statement we have made, when we consider the vast expense thus incurred by the farming interest, shows of how great importance any means are by which its amount may be diminished. We extract the following from a published Lecture, delivered by Mr. Hyett, of Painswick, before the Gloucester Farmers' Club:—

"Some of the very latest improvements, effected by the application of scientific principles, have been mathematically * proved to be the saving in tractive power of one horse in three as applied to the plough; and presuming, as seems more than probable, that equal economy is effected by the use of light carts instead of waggons, and the new cultivators instead of the old scufflers and drags, let us calculate what that saving is. It has been computed in districts where improved implements are used, that two horses are required for every 50 acres of arable land. If the inferior implements were employed, three would be necessary. Take the average value of a cart-horse at 15*l*., and his annual keep at 36*l*. 10*s*., or 2*s*. a day. Sir J. Sinclair, in his 'Scottish Husbandry,' gives the annual keep for each horse, averaged for eleven districts in Scotland, as only 28*l*., or 1*s*. 6½*d*. a day, but the cost of shoeing and gearing, &c. does not seem to be included. Mr. Curtis Hayward, in the Paper which he read to this Club, calculated it, including all these extra expenses, to be with us 2*s*. 6*d*. a day; so I cannot be far wrong in taking the mean, or 2*s*. a day. Suppose a farmer, with 100 acres of arable land on his farm, with unimproved implements, using six—with improved, only four horses; the saving in the first cost of the two extra horses would be 30*l*., that in their annual keep, 73*l*., or 14*s*. 7*d*. per acre—a sum, perhaps, nearly equal to half of the average rent of arable land in England.

"To understand how vast the benefit which the country in general might derive from the universal use of these improved implements, let us extend the same calculation to the whole arable land of the country, which I believe I am under the mark in setting at 12,250,000 acres for England and Wales, which at

Three horses for every 50 acres, give	.	735,000 horses
At two ditto ditto	only	490,000 ,,
The number of horses saved being	. .	245,000
Their cost at 15*l*. apiece would be	.	3,675,000*l*.
And their annual keep . . .		8,943,500*l*."

* The dynanometer, as affording the measure of the draft of horses, is itself no small debt to science; and perfected as it now is at the Uley Works, by the ingenious adaptation of self-registering machinery, it promises to the farmer information as accurate as it must be valuable.

EXPERIMENTS WITH NITRATE OF SODA, &c.

[WE have received the following valuable paper from Mr. Grey, of Dilston. It was written by him in 1841, and being read at the meeting of the Highland Society at Berwick, was printed in the newspaper reports of the time.]

On the 28th April, 1840, I sowed upon each alternate ridge of a plot of land consisting of four acres, of good gravelly loam, which had lain three years in grass and was thickly covered with plants, nitrate of soda at the rate of 1 cwt. per acre, having ascertained the exact contents of each ridge and divided the nitrate accurately into the right proportions. To some of the alternate ridges I applied gypsum at the rate of 10 bushels per acre. To one ridge I applied both the nitrate and gypsum, upon the principle of "the more good things the better;" but the result, in this case, proved the maxim fallacious. And three ridges were left without any application whatever. The Grass to which the nitrate was applied assumed in a few days a darker colour than the other, rose quickly above it in height, came earlier into seed, and was sooner fit for cutting. The plot was all mowed and made into Hay at the same time, great attention being paid to keep the produce of each of the ridges intended for the experiment distinct. The following is the weight of Hay produced by each plot, and at this time the aftermath of those ridges to which the nitrate was applied is obviously better than the others:—

Nature of Manure applied.	Produce per Acre, calculated from that of 112 square yards.
No manure	2 tons 81 stones
10 bushels of gypsum per acre . .	2 ,, 81 ,,
1 cwt. of nitrate of soda . . .	3 ,, 146 ,,
10 bsh. of gypsum and 1 cwt. nit. of soda	3 ,, 125 ,,

The cost of the nitrate on the ground was 22*s*. per cwt., and the increased value of Hay per acre, as it stood in the fields, would be from 4*l*. to 5*l*.

From the many experiments which have been made, and which have all proved more or less beneficial, no doubt can be entertained that nitrate of soda is generally efficacious in the production of Grass; but several experiments may yet be necessary to ascertain on which description of soil and to what class of plants it is most so, and at what particular stage of their growth it is to be applied with the greatest benefit. I am inclined to think, from the little experience I have had in the matter, as well as from the consideration that it does not act through the medium of the soil, as a manure, but rather as a stimulus to the plants, that it ought not to be sown upon the Grass until it has risen considerably from the ground and the blades are sufficiently evolved to derive all possible benefit.

I applied nitrate of soda to a row of Potatoes, at an early period of their growth. The tops soon showed the effect, and far outstripped the adjoining rows in growth; but when the Potatoes were taken up the produce of that row was found to be less than that of the others, both in weight and measure.

The first action of the Potato plant is to throw out its top. The roots make their growth at a later period. It seems in this instance that the stimulus of the nitrate had expended itself in the earlier process, and that the roots, instead of being benefited, had suffered by the application—probably from the greater shade and weight of top.

I applied nitrate and gypsum also to alternate ridges of different kinds of grain and at various stages of its growth, but the quantity of rain that fell in this part of the country, both previous to and during the time of harvest, had the effect of producing so much straw, and of laying the corn so flat, that it was found difficult to cut the plots so as to keep the produce of each perfectly distinct, and was also in other respects so unfavourable to the experiment that I cannot reckon upon the result being very correct and satisfactory. In one case where the Barley was very bulky, and in consequence much lodged, the grass seeds were found to be weak and worse than in any other part of the field; but in another instance the reverse of this was the case. The crop was a thin one of winter

Wheat, on poor clay land. Four ridges were sown with nitrate when the Wheat was about a foot high; little effect was perceptible during its growth, save in a darker shade which it assumed, as is common to all crops where nitrate is applied; and on being cut those ridges produced so few sheaves more than the others, that I was not induced to keep their produce separate; but in the spring of the following year, the new grasses upon them were found to be much better than upon any others in the field. The pasture was heavily stocked with ewes and lambs, and eaten bare, the sheep giving those ridges the preference. When the lambs were weaned, the pasture was cleared of stock for a fortnight, when the same thing was repeated; the Grass on those ridges again took considerably the lead of all the rest, and was again preferred by the sheep when they returned to it. This was a result which I had not anticipated, and proves either that the effect of the nitrate continued in operation during the following season, or that its effect in the first year upon the grass was such as to nourish and strengthen the plants so much as to cause them to stand better through the winter, and to shoot out much more vigorously in the spring. The latter is, I think, the more reasonable conjecture.

In the beginning of May last, (1841,) I applied nitrate of soda and a mixture of nitrate and manganese to equal quantities of grass of the first year's seeds, intended for mowing, leaving a portion without any dressing. The land was well covered with plants of red and white Clover and Rye Grass, but not of first-rate quality. Both portions to which the dressings were applied soon assumed a dark appearance and a rapid growth; the difference was perceptible at any distance from which the field was visible. The different portions were cut, and the produce of each carefully kept distinct and weighed when made into hay and put up in pikes, of which the following is the result:—

Description of dressing.	No. 1. Nitrate of soda, 1 cwt.	No. 2. Manganese and nitrat. of soda, equal quantities, 1¼ cwt.	No. 3. No dressing.
Weight of Hay per acre.	3 tons 88 st.	3 tons 21 st.	2 tons 37 st.
Value of Hay on each acre, at 3*l.* per ton	£ 10 s. 13 d. 0	£ 9 s. 7 d. 10½	£ 6 s. 13 d. 10½
Cost of each top-dressing per acre	1 6 0	1 1 0	0 0 0
Value of Hay per acre, deducting expense of top-dressings	9 7 0	8 6 10½	6 13 10½

When the aftermath had begun to shoot up, I applied the same dressing as above, and also a mixture of guano and soil to portions of the land which were left without anything before. The effect as to colour and growth was the same as in the previous experiment, from the nitrate and manganese. That from the guano was less apparent and slower, but still the growth was greater than where nothing was applied to the grass. One thing was very obvious, that the stock when put into the field gave a great preference to the portions which had received the saline dressings over that to which guano had been applied, as well as to that which had nothing.—*John Grey, Dilston House.*

(To be continued.)

REPORT OF DR. VON MARTIUS ON GUANO.

In answer to the summons of the general committee, I have the honour to submit the following report upon the nature of guano, upon its history, and also its utility as a manure in Bavaria. Guano is the excrement of various sea-birds, as the cormorants, flamingoes, cranes, &c., and is found on many little islands off the coast of Peru, situated between 13° and 21° south latitude. Its quantity is so great that it is obtained by means of mining operations. The word guano belongs to the old Peruvian or Quichua language, and signifies muck, or dung. It is pronounced Huanu by the Peruvians, which the Spaniards, according to the genius of their language, spell guano. This substance was known to the inhabitants of Peru as a valuable manure long before the possession of their country by the Spaniards; and the success of the culture of the barren sandy tracts of land along the coast depended in a great measure on the use of this substance, so favourable to vegetation.

The use of guano as a manure was first mentioned by Inca Garcilasso de la Vega, a Spaniard who wrote on Peru as early as 1723, in a work entitled "Commentarios Reales." "On the sea-coast," says he, "between Arequipa and Tarapaca, in a tract of land more than two leagues in length, they have no other kind of manure than that afforded by sea-birds, which dwell in countless numbers on the sea-coast. They lay their eggs on certain islands along the coast, and the quantity of excrement they leave there is astonishingly great. At a distance the masses of excrement look like the tops of a range of hills. At the time the Incas governed Peru the birds were preserved with great care. The punishment of death was decreed against those who landed on the island during breeding-time, or frightened the birds, or at any time destroyed them. Each island was a distinct province, or, when large, was divided into several provinces, over each of which an overseer was appointed by the Incas, whose care it was to see that every district had its due proportion, and no one defrauded his neighbour of the universally-needed manure."

Frezier, who travelled in Peru in 1712 to 1714, mentions having seen in the port of Arica, and in the island of Iquiqua, the guano dug up by Negroes. About the same time Feuillé also speaks of the pestilential exhalations from the guano islands, and of the ships (*Guaneros*) employed along the coast for its exportation. Ulloa, also, later reported on it in his great work upon Peru. Alexander von Humboldt was the first who brought specimens of guano to Europe, which was in 1804. He sent specimens for examination to Vauquelin, Fourcroy, and Klaproth*, and spoke of it himself in the following manner:—"The guano is deposited in layers 50 or 60 feet thick on the granite of many of the South-sea Islands, off the coast of Peru. During 300 years the coast-birds have only deposited guano a few lines in thickness. This shews how great must have been the number of birds, and how many centuries must have passed over in order to form the present guano-beds."

Humboldt put the question to Klaproth as to whether the guano had been deposited on the present islands, or had been thrown up by some convulsion of nature. Although at first sight the simplest explanation appears to be that it was deposited by birds in its present position, yet an objection occurs from the fact that neighbouring islands present no guano. But this objection may be overruled by the well-known fact that birds return always to the same places to nidify, and an analogous phenomenon takes place in those islands which are exclusively sought by turtles for the purpose of laying their eggs. But be this as it will, the guano exists in such quantities as to give it the importance of a geological formation, and in this respect is the counterpart of those formations which owe their existence to animals, as those formed by species of recent infusoria.

The guano layers, according to the length of time they have been deposited, have undergone many changes. Here and there they are covered with siliceous sand, and have thus been protected from the influence of the weather. In other places, on the other hand, they are open and exposed to the action of light, air, and water, which have effected in them many decompositions. Such changes are indicated in most cases by an ochre-yellow guano, resembling Spanish snuff, the colour changing according to the greater or lesser amount of decomposition. Fresh guano is of a white colour, but that which is dug up has a bright or ochre-yellow, brown, or red colour. The chemical composition of guano is very various; and this point should be attended to where large quantities are bought, as some sorts are worth nothing like so much as others.

(To be continued.)

* For the results of the examination of these chemists see "Memoires de l'Institut," tom. vi.; and Klaproth's "Beiträge," vol. vi.

ON MINERAL AND INORGANIC MANURES.

No. VII.

By Professor Charles Sprengel.

2. *Chalk.*—Chalk is one of the most recent lime formations; and although it consists chiefly of carbonate of lime (lime and acid combined in the same proportion as in the limestones), it contains always more extraneous admixtures than the solid limestone,—so much so, that it often passes into marl. To these admixtures—clay, silica, magnesia, phosphate of lime, common salt, &c.,—its value as a manuring substance is chiefly owing. If it contains much clay, like marl, it will fall to pieces if lying in the open air, as the marl does; if it contains much silica it must be burnt first like the lime, else it will not fall to pieces; but in burning it, too much heat is to be avoided, else a silicate of lime will be produced. At times chalk is so earthy, that it can be easily broken in pieces, and then it may be used without being burnt. In this case, however, it will never manure so well as if it had been burnt, as it will be deficient in caustic properties, and must then be used in large quantities, in order to produce any striking result. If earthy chalk be burnt, large lumps of it are first baked, and then placed in kilns constructed for that purpose. Whenever fuel is not too expensive, it will always be best to use chalk in a burnt state, especially if a ferruginous, sour, clayey, or peaty soil is to be acted upon. It is true, a clayey soil may be also improved mechanically by unburnt chalk, but then it must not be too stony, and large quantities must be used.

If chalk is burnt, its effects are similar to that of lime; if unburnt, it acts like marl, of which we shall speak presently. Of burnt chalk no more is required, per acre, than of burnt lime; of unburnt, however, the quantity is to be as great, or even greater, than of those marls which are richest in lime. It must be taken into account whether chalk is earthy or stony; because, as the latter acts but very gradually, a much greater quantity will be required. In meagre, light soils, however, neither earthy nor stony chalk will act beneficially, which might naturally be expected, as these soils are deficient in most substances which plants require for nourishment, and such chalk does not convey to the ground any of those substances except lime. I once saw earthy chalk used with great confidence on a clayey soil not deficient in humus, but the result was so much less than was expected, that the experiment was never repeated.

3. *Marl*—which has been used from time immemorial as a manure, is a compound of clay and carbonate of lime. Still, however, chemical analysis proves that most sorts of marl contain more or less of carbonate of magnesia, gypsum, common salt, silicate of potash, silicate of soda, manganese, quartz, and some other substances. These must not be left unnoticed, because we shall see presently that it is on these very substances, hitherto not duly taken into account, that the value of marl depends. According to its predominant constituents, it bears the name of lime, magnesia, clay, and sand-marl.

A characteristic criterion of marl is, that being exposed to air it will fall in pieces, which is caused by the various degrees in which its component parts attract water; and as different degrees of expansion are thereby produced, it is obvious, that on becoming successively wet and dry, these parts will separate from each other.

There are earthy and stony marls. The former is mostly found in the diluvial formation, and owes its origin to a most diversified composition of mineral substances (*vide* my treatise on soils). Some distinguish also a shell-marl, which is mostly composed of decomposed *molusca*, and is to be found mostly in low grounds under a marshy soil, consequently where, most probably, fresh-water lakes existed at a former period. Under this name, also, may be considered that calcareous earth which near the sea-coast underlies marshy localities.

It is by the carbonate of lime and magnesia contained in marl that the effervescence is caused which takes place when mineral acids are poured on it, as by these, carbonic acid is driven off, and escapes in the form of gas. Its colour, at times green, blue, violet, yellow, red, or brown, is owing to both oxides of iron (protoxide and oxide), and if the colour of marl be grey, black, or blackish-brown, it is owing mostly to an admixture of coal, bitumen, or humus. The value of marl, however, as a manure can never be arrived at, either from its colours or the degree of its effervescence with an acid, or by any other external criterion; this can only be done by chemical analysis, because, at times, it is owing to the presence in it of substances existing in very small quantities, and not discernible by outward appearance. It is with marl as with all other manures, it is useful only when it contains substances in which the soil is deficient. If, for instance, the soil does not contain enough gypsum, but, with this exception, if it contain all other mineral substances in such proportions as are required for the nourishment of plants, for such a soil, we say,—a marl which contains no gypsum has little or no value. If, on the contrary, a marl contains but little gypsum, it will improve a soil which is entirely deficient of that mineral, even if it contained so little carbonate of lime, that it could hardly claim the name of marl at all. It is the general opinion that that marl is best which contains most carbonate of lime; but this is fully contradicted by experience, although it cannot be gainsaid, that this is one of the most effective and powerful of its ingredients. That sort of marl, therefore, which may be very valuable for one sort of soil, is valueless for another; for the chemical constitution of the soil must always be taken into account. It may be generally assumed, that that sort of marl will be best which contains all the substances required for the nourishment of plants in a due proportion, as in this case, even if the soil to be manured should possess some other nutritive substance, it will be improved by the other component parts of the marl. Silica, however, may be excluded from this calculation, as most soils, moors and marshes excepted, contain a sufficient quantity of it. A marl which consists merely of carbonate of lime and clay possesses but four substances which improve vegetation; whilst a marl, which, besides these two component parts, contains also gypsum, common salt, silicate of potash, phosphate of lime, saltpetre, manganese, and magnesia, will yield to the plants twelve different nourishing substances. It is obvious that a marl which contains many nutritive substances of plants must be preferable to one which possesses but few. If, therefore, any marl contains all the mineral substances which the plants require for nourishment, it may be used to advantage on all sorts of soils; but if, on the contrary, it contains only 4, 5, 6, or 7, it will act beneficially only on such soils as are deficient in those ingredients which it contains. An absolutely and a relatively good marl may thus be distinguished, the former being met with but very rarely in nature, the latter most abundantly.

(To be continued.)

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. VI.

(Continued from page 91.)

I will now proceed to treat separately of the two classes of chemical constituents in all plants—Organic and Inorganic, the elements of which must in some form or other be supplied to the plant.

1.—Of Organic Principles:—

A—Non-Azotized.

Represented by
- *A* Sugar
- *B* Starch
- *C* Gum

} Saccharine group.

- *D* Oil
- *E* Fat
- *F* Wax

} Oleaginous group.

B—Azotized.

Represented by
- *G* Vegetable Fibrine
- *H* —— Albumen
- *I* —— Casein

} Albuminous group.

2.—Inorganic Principles:—

Are principally
- Lime
- Silicon
- Muriate of Soda (Salt)
- Carbonate of Potash or Magnesia
- Phosphorus
- Sulphur
- Iron,

and the ultimate chemical composition of the above will be seen at a glance of the following table. Those who wish for further information will readily find it by reference to Turner, or any other elementary work on Chemistry.

Organic Principles.

		Oxygen.	Nitrogen.	Carbon.	Hydrogen.
Non Azotized.	Sugar	51	—	42	7 = 100
	Starch	49	—	45	6 = 100
	Oil, fat, &c.	9½	—	79	11½ = 100
Azotized.	Albumen, Fibrine, Casein	22	16	55	7 = 100

The difference in chemical composition of the azotized group is so slight, that I have classed them together as identical, which they are, according to the testimony of

Liebig. Under the head of oxygen, also, in the same group, a slight proportion of sulphur and phosphorus is included. I have taken round numbers to avoid the inconvenience of decimals.

Of the Inorganic Principles; iron, sulphur, phosphorus, and silicon, are elementary. Muriate of soda, or, more properly speaking, chloride of sodium, consists of two elementary principles, chlorine and sodium; and the salts of potash, or magnesia, consist of carbonic acid and the oxides of potassium and magnesium.

With the exception of gelatine, which is produced by the metamorphosis of albumen, the above are also the constituents of all animal structure. The world of vegetable and animal life is, in reality, resolvable into the following elements:—

Oxygen
Hydrogen
Carbon
Nitrogen;

with deposits in cellular structure of one or more salts of the following:—

Calcium or Magnesium
Sodium or Potassium
Phosphorus
Iron
Silicon

These elements, moulded into being by the hand of Creative Wisdom, and endowed with the mysterious and incomprehensible principle of life, become converted into the endless races of animals—immense forests—the deep water of the sea, or the atmosphere that supports and retains the vitality of living beings.

Now, I do not consider that much knowledge will be gained by the Agricultural student of chemistry, by confusing himself with minute descriptions or details of particular analysis; instead, therefore, of a great array of figures, which nobody can understand but chemists themselves, I shall content myself by making some simple observations separately upon each of the constituents of plants.

Of the Saccharine Groups: Sugar, Starch, Gum.—There are two varieties of sugar, one derived from the cane, called CANE SUGAR; the other produced by the transposition of the elements of starch in ripening fruits, called GRAPE SUGAR. It is the latter of these, as an element of food and a constituent of plants, which I shall consider here.

If you cut an unripe Apple or raw Potato, and rub the cut surface upon a grater, a solution of very fine flour of pure starch will be obtained. In the unripe Grape, in Turnips, Mangold Wurtzel, the grain of Wheat, Barley, or Oats, Beans, Peas, &c., it is very abundant. In the process of ripening fruit, which we well know requires heat, this starch is converted into sugar by a simple transposition of elements, which a reference to the composition of the substances will show (*vide* table). This change also takes place in the process of malting, the success of which operation depends upon the existence of the principle of life in the seed. Now this vital principle, of the nature of which we know nothing, and very probably never shall, is, from the commencement to the end of life, constantly effecting the most profound chemical changes in the living body. In the instance before us, chemical action is induced to convert the starch into food for the embryo plant. During the change, a reference to the table will show that carbonic acid is constantly set free. Now this carbonic acid nourishes the embryo plant, precisely in the same way as the carbonic acid, which results from the decomposition of humus, nourishes it in a future state of its existence. But the maltster wants all the sugar he can get in his malt. When, therefore, the experienced maltster finds by the length of the germ or root that the ever-acting chemist, life, has changed the whole of the starch in the seed into sugar, he destroys the life of the embryo by heat. If he did not do this at the proper time, his malt would be spoiled, for the growing plant requires food, and quickly appropriates the sugar to its own use. As an instance of the transposition of chemical elements, let us pursue this digression a little further; when the malt comes into the hands of the brewer, his object is to obtain an *alcoholic* solution, called beer. He first dissolves all the sugar in the malt by boiling, after which his object is simply to convert the sugar into alcohol; in equivalents the following is the composition of alcohol and Grape sugar:—

	Carbon.	Hydrogen.	Oxygen.
Alcohol . .	4	6	2
Sugar . .	12	14	14

By chemical calculations, which would be out of place here, it can be proved that the results of the change in the sugar is alcohol, carbonic acid, and water; the carbonic acid being given off during the change or fermentation, and the water serving as a solvent for the alcohol.

Now this fermentation is produced by the action of life. Yeast is a plant of a low organisation, and is constituted of a number of small spherical cells united together in a line. Each of these cells contains many germs, which, by the constantly-repeated deaths and bursting of the parent cells, become free, and form full-grown cells themselves. In this manner the yeast-plant rapidly grows throughout the cask of sweet-wort, and produces the change of sugar into alcohol, with the constant escape of carbonic acid from the surface, which is called "the working of the beer." The importance, then, of sugar existing in plants, either as a distinct compound, or by its elements in the form of starch, will be apparent.

Starch, or principles similar to it, exists in all plants connected with Agriculture. It is an essential ingredient in the food of animals, because it is absolutely necessary to support the functions of respiration and animal heat. It is a valuable principle to the farmer, for it is necessary in food to produce fat; and it is equally essential to the reproduction of the crop, for without it seed would not germinate.

Gum is found in the bark and wood of all plants. It is well known in its simple form as gum arabic, and it is highly nutritious both to man and animals. Six ounces of gum arabic have been found sufficient to support an adult man or woman for twenty-four hours. This, however, could not continue long, as the want of azotised food would prove fatal to the experimenter. The same remark applies to sugar and starch; they are highly nutritious as supporters of respiration, but alone are incapable of supporting animal life. Woody fibre, which is very nearly the same in chemical composition in all plants; in the Turnip-top, or the ship's mast; is represented by the Saccharine group*. It is, in fact, very easily converted into sugar; 100 parts of linen rags will yield 114 of sugar, when treated with sulphuric acid.

As I have not attempted a chemical dissertation upon the different parts of the plant, I have said nothing about the sap. I may observe, however, that the ascending sap is nearly similar in all plants, but that important changes take place during its circulation in the leaves. Much interesting and valuable information on this point, written with peculiar clearness, may be found in Professor Henslow's Letters to the Farmers of Suffolk, or Dr. Carpenter's Popular Cyclopædia, vol. Vegetable Physiology and Botany—a very excellent and cheap publication.—*C. R. Bree, Stowmarket.*

(*To be continued.*)

Home Correspondence.

Superphosphate of Lime.—The following is the best process for forming superphosphate of lime and other salts of phosphoric acid. I give the process that I used before I possessed appropriate machinery for mixing the acid with the bones. By means of this machinery I am capable of greatly reducing the quantity of water which is otherwise necessary to effect the complete decomposition of the phosphate of lime. Calcined bones are to be reduced by grinding to a very fine powder, and placed in an iron pan with an equal weight of water (a cast-iron trough, such as are sold for holding water for cattle will do); a man with a spade must mix the bone with the water until every portion is wet: while the man is stirring an assistant empties at once into the pan sulphuric acid, 60 parts by weight to every 100 parts of bone; the acid is poured in at once, and not in a thin stream, as commonly recommended; the stirring is continued for about three minutes and the material is then thrown out. With four common farm-labourers and two pans, I have mixed two tons in one day, the larger the heap that is made the more perfect the decomposition, as the heap remains intensely hot for a long time. It is necessary to spread the superphosphate out to the air for a few days, that it may become dry. The great mechanical difficulty of reducing unburnt bones to a very fine powder renders the formation of superphosphate of lime from them very difficult, but common bone-dust in a pure state (that which is sold contains about one-third of lime) may be decomposed by boiling it in a leaden pan with half its weight of sulphuric acid and twice its weight of water, which may afterwards be dried up with sawdust or clay-ashes.—*J. B. Lawes.*

In what do the Fertilising Qualities of Bones consist?—There seems still to be some doubt in the minds of some of your readers whether the phospate of lime, or the gelatine, is the fertilising substance in the bone? I would suggest the following experiment, which I have tried myself, and which has satisfied me that the animal matter in the bone merely acts by yielding, by slow decomposition, phosphate of lime in a state capable of being assimilated by plants; and to the phosphate of lime being in a similar state in guano, and not to the ammonia contained in it, may be attributed the powerful effects of this valuable manure. To every 100 parts of large bones add 400 parts of water and 100 parts of muriatic acid, let it stand for four or five days, and then drain off the liquid, and add the same quantity of fresh water and acid four times; by this means the whole of the phosphate of lime will be dissolved in the liquid, and the bones will retain their original form; they must be repeatedly washed until the water ceases to taste acid, then dry them in an oven, and rub them to powder. Evaporate the whole of the liquid in which the mineral matter of the bone was dissolved until nothing but a dry paste remains; heat this to redness, rub it to a fine powder, and convert it into superphosphate of lime in the manner already described. Let two equal quantities of ground be sown with Turnips, strain the seed and one of these two manures together, and the result will satisfy the most sceptical. I have lately seen a large quantity of Swedes growing upon the light sands of Norfolk, in which four bushels of my superphosphate of lime per acre were used, and the crops were excellent,—the superphosphate was formed from calcined bones which did not contain one-half per cent. of carbon.—*J. B. Lawes.*

A Word in Favour of the Rooks.—Having observed in the 4th Number of the *Agricultural Gazette* that a meeting had been held in the town of Dumfries, Scotland, for the partial destruction of the rooks in that district, we beg leave to offer a few remarks in their favour. These birds certainly eat grain and Potatoes, but it is much to be questioned whether, when following the sower in the field, they are not more intent upon the larvæ of numerous insects, which the operation of ploughing and harrowing brings to the surface, than upon the grain which is scattered amongst them. The crops of these birds, at the period under consideration, will be found to be more abundantly stored with worms and various insects, both in their larva and perfect state, than with grain; and what they do eat would not be the tenth of what would be consumed by the insects which they destroy. We find the following in behalf of the rooks in the "American Farmer." "Every crow requires at least one pound of food a week, and nine tenths of their food consists of worms and insects; 100 crows, then, in one season, destroy 4,780 lbs. of worms and insects." From this fact some idea may be formed of the benefit of this much persecuted bird. Were it not for these useful birds our fields would soon swarm with the larvæ of insects, which would, if left to have their own way, let neither man, bird, or beast reap the fruits of the earth. If we look to those countries where these useful birds are persecuted, we shall find that the formidable cockchafer (Melolontha vulgaris) and other destructive insects, destroy nearly the whole of our field and orchard crops; while in those places where these useful birds are allowed to remain unmolested, the ravages of these destructive insects are unknown. Natural instinct seems to direct the rook to this species of food, while man is unconscious of the circumstance. Thus we often see flocks of these birds busily employed in grass-land and meadows, picking up food which is not visible on the surface. From observation we can assert that their employment in such cases is in perforating the surface-sward with their bills to search for the larvæ of different insects, which are, at the same time, actively devouring the roots of the grass. Even while engaged in this important service, the husbandman in nine cases out of ten drives them away. In this district the rooks migrate as soon as the operation of sowing is finished, taking with them their young, spending the most of the summer on large heaths and moors but scantily supplied with food. They again return to us towards autumn to destroy the perfect insects, many of which begin at this time to deposit their eggs. At this period rooks do infinite good, as for each insect they destroy they are the means of destroying many. It has been observed that the sole employment of the rooks for three months in spring is to search for this kind of food, and the havoc a numerous flock makes amongst these destructive insects must be very great.—*J. Mc L., Hillsborough.*

Preservation of Root Crops.—The usual method of storing Swedes, either by earthing up in the field or covering in pits, is liable to objections. Having preserved Carrots by cutting off the upper part as well as the green top, and letting them remain earthed up in the ground where they grew, I have this season been induced to try the same method upon a small patch of Swedes. If covered in the field they sprout, and otherwise lose much of their nutritive properties; if put into pits the fermentation which takes place is still more injurious in this way. By letting them remain in the ground, preventing germination and covering the top with mould, I believe we shall best succeed in preserving their enriching properties uninjured. The process of cutting off the top may be done with a hoe, but it requires a deep cut beyond the germinating circle, and all that is cut off should be taken to the sheep-fold, so as not to waste a leaf. The earthing up is a very easy process—supposing the Turnips drilled, as the double mould board plough drawn between the rows is sufficient.—*S. C.*

Another New Manure.—I send you a specimen of the dung of Bats, received from Jamaica. It is found in considerable quantity in the Caves near Dry Harbour, and in the Guy's Hill District, in the parish of St. Ann, in that island. The following analysis is by F. J. Fleming, Esq., a Member of the St. Ann's Agricultural Society:—

500 *Grains of the Matter appear to be composed of*

Water of Absorption	116
Uncombined Phosphoric Acid	4
Oxide of Iron	3
Phosphate of Lime	181
Carbonate of Lime	16
Animal and Vegetable Matter, giving out a fœtid gas by combustion	99
Matter indestructible by Heat	81
Grains	500

This substance, which is of a dark or chocolate colour, is expected to prove a highly valuable manure; it had been tried by covering it with earth in the cane-hole; but a writer in the *Jamaica Times* suggests that it should be used broadcast, being previously mixed with wood-ashes or powdered charcoal.—*T. E.*

Bones.—The supply of Bones for crushing is not now so plentiful as formerly. There are large quantities of the bones of the small Whales, which are killed in hundreds at a time, lying on the sea-beaches of Orkney, Shetland, and the Faroe islands, and which probably may be had for the trouble of collecting. It may be well for those concerned in crushing bones for manure to look to these quarters; and also to induce Whale fishers, who go to the Greenland seas, to save as great an amount of the skeletons as possible, to be brought home; or to have them towed on shore, to be sent for afterwards. The Seal fishery might also supply a very large store.—*G.*

Steeping Seeds.—It may not be uninteresting to know that the practice of steeping seeds, recently brought under the notice of the Highland Society by Mr. Campbell, of Dundee, was tried 150 years ago, as appears from the subjoined extract from the "Farmers' Magazine" for December, 1810. The experiment there mentioned seems to have been even more successful than those of Mr. Campbell. To him, however, the farmer's thanks are due for reopening the subject, at a time when the attention of eminent scientific men is so much directed to making their discoveries available for the purposes of Agriculture:—"Charles Miller, son of the celebrated botanist, published

* Starch, sugar of milk, woody fibre, cane-sugar, and grape-sugar, all contain the same quantity of carbon, united with different quantities of oxygen and hydrogen, in the proportions to form water.—*Turner's Elements*, p. 921.

a recipe for fertilizing seed, and tried it on Wheat, by mixing lime, nitre, and pigeon's dung in water, and therein steeping the seed. The produce of some of these grains is stated at 60, 70, and 80 stems; many of the ears six inches long had 60 corns each, and none less than 40. This experiment was made in 1692 (see "Everard's Essays and Experiments"); yet I do not find the idea acted upon. I incline to think it founded on nature, and worthy of serious investigation. We are careful to fertilize the soil—why not the seed?"—*James Caird, Baldoon, Wigtown.*

Cheap Method of Bruising small Quantities of Bones.—In your third Number, under "Notices to Correspondents," I observe "*Waste of Bones*—There is no cheap machine that we know of for crushing bones," &c. This induces me to send you the following cheap method which I tried last year with good effect:—Strew them on a hard road with a quantity of burnt soil near your fold-yard, where you are going to cart out manure or soil, so that the wheels may pass over them. Rake them occasionally to those tracks over which the wheels run; the burnt soil will absorb the oily matter expressed. Gather them up at night and pass them through a riddle, and what will not go through put down again the next day on the road with more burnt soil. It should be a fine day.—*F. M.*

Loss of Crop by Exposure of the Manure to the Action of the Weather.—On the 28th of April, 1843, in planting Potatoes we spread the manure for 19 ridges, but we could only complete 12 before night came on, and the following morning being rainy we could not proceed; the 30th was Sunday (a sunny day), and on Monday morning we finished the remaining seven rows. The 12 rows first planted came up a week before the others, and distinctly kept the lead throughout their growth, so much so, indeed, that if we had not noted the circumstance at the time, we should have been at a loss to account for the great difference between the two plots, both manure and sets being alike for each. On the 27th October we raised the crop, and the seven exposed rows yielded less in weight by 5st. 3lbs. per row than the other 12 rows—the length of the rows was 75 yards, thus showing a lighter crop by 3½ tons to the acre; the Potatoes too were scabbed and inferior in quality. The manure was night-soil and ashes, with Epsom salts. My attention was drawn to the effect of the weather upon exposed manure by a former article in the *Chronicle*, and there certainly is not a more important matter connected with improvement in farming than the economical treatment of manure.—*A Subscriber.*

Draining Materials.—Living in a part of the country where tiles are dear, and having plantations of Scotch Fir to thin, I thought of trying some of the thinnings as a substitute. I took some of the worst growers, from 12 to 20 feet long, and averaging 4 to 5 inches diameter, and I cut them lengthwise with the saw, and laid them at the bottom of the drain, turning the convex sides inwards, which then touched each other along the centre. The flat sides were then placed close against the banks, and being covered with Heath the drains were filled up in the ordinary way. Semicircular stuff thus placed of course leaves a hollow space both above and below; and while the under one here answers to the tile-tube, the upper far surpasses in efficiency the few small holes pierced in the tile for the percolation of the top water into it, the flat sides pressed against the bank giving it a tendency to run to the centre, and at the same time preventing the soil from falling in upon it. This plan was tried on a flat meadow, so wet as not to admit of a man's weight without 'podging,' as it is called. In less than a month after drainage this meadow would bear cattle upon it, and young Clover began to spring all over the field. This success makes me doubt whether this is not a more efficient mode of draining than that with tiles, carrying off the water quicker, and not being so liable to break in its course by the pressure of weights passing over the drains; and the wood, I apprehend, so excluded from air, will last a number of years, especially if cut when the sap is in it.—*A Surrey Farmer.*

Nitrate of Soda.—In November, 1842, a field of six acres was sown with Wheat. Soil, a strong clay; the previous crop, Beans. I think it was owing to the abundance of rain in the spring of 1843, that the plant assumed a sickly appearance. Wishing, if possible, to recover it, I applied, in May, as a top-dressing, 2 cwt. of nitrate of soda per acre, to half the field. To the other half I applied guano, allowing the same quantity per acre. In a few days the Wheat on the land on which the nitrate of soda was sown was visibly altered, and soon had quite a healthy and rank appearance. That to which the guano was applied did not improve at all, and at the time it was harvested had its original unhealthy and stunted appearance. The straw of the plant to which the nitrate was applied stood on an average seven inches higher than that in the other part of the field, the grains were likewise considerably larger, and the ears better filled. This fact I mention to show that as a top-dressing for Wheat, I did not find guano answer; but when hoed, harrowed, or drilled in, I understand from those who have tried the experiment, its effects are highly beneficial.—*Yeoman.*

Liming Land with a Northern Aspect.—In the translation from Professor Sprengel's account of lime, published in your Paper of the 27th ult., is the following observation:—"It is asserted that the manuring with lime is injurious on fields that slope much towards the north," &c. It is evident to those who have been in the habit of liming for Wheat, that the plant does not look so thriving in the winter as on unlimed ground, but from the end of March, or at least when the weather begins to improve, and the sun gains more power, the crop manured with lime gradually takes the lead, and keeps it till harvest. Lime certainly is a good conductor of heat, as is proved by the rapidity with which a heap of mortar freezes when exposed to a low temperature. This may in some measure account for lime not being so beneficial on land much exposed to the north, because such a situation is not only much exposed, but it is also nearly deprived of the rays of the sun in the short days during the winter months. I am convinced of the benefit of lime as a manure for Wheat, and should not hesitate to use it in moderate quantities with a northern aspect, but in that case I should recommend the lime to be laid on early in the summer, before the first ploughing. By this means all the advantage of the manure would be obtained and the injurious effects avoided.—*A. Hall, Chepstow.*

Means of improving the Quality of Manure.—My experience and observation have taught me that great care should be taken of the liquid manure, and that well-constructed tanks should be formed conveniently to receive it as it flows from the cow-houses, from which it should be pumped and carried back to the yard to saturate the dung-hill, this being of great advantage in assisting decomposition. The midden-stance would require a very small inclination towards the tanks, so that the surplus sap, after saturation, may return. The urine requires to be diluted with an equal quantity of water, to enable it to retain its ammonia. Each addition to the manure-heap should be regularly spread, with a small quantity of sulphuric acid or gypsum strewed over the surface to prevent the escape of ammonia. A large quantity of straw may, by this process, be converted into excellent manure, when mixed with the dung from the cow-houses and stables; but I quite disapprove of the frequent turnings in many places given to manure, which causes it to lose much of its fertilising property. I would advise "R. C." to sow a little of the approved mineral manures along with his crops, rather than mix them in his muck. Now that there is a spirit of inquiry amongst our Agricultural population, I hope a judicious plan will soon be adopted of collecting and manufacturing the cloacine and manures of our large towns, to admit of their being transported to a distance. In many towns the common sewers run into rivers, the matter they contain being thus entirely lost. But if the authorities would take up the subject, a plan might be devised to retain the sediment, and have it formed into a transportable manure. It would become an important branch of industry, and save many thousands to the United Kingdom now paid for foreign manures—*A Perthshire Farmer.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

At a weekly council, held at the Society's House, in Hanover-square, on Wednesday last, the 14th of Feb.: present—his Grace the Duke of Richmond, K.G., in the chair; Earl of March, Thomas Raymond Barker, Esq., F. Burke, Esq., F. C. Cherry, Esq., A. E. Fuller, Esq., M.P.; H. Gibbs, Esq., B. Gibbs, Esq., L. Rogers, Esq., Professor Sewell, H. S. Thompson, Esq., and George Wilbraham, Esq., Willlam Holbeck, Esq., of Farnborough, near Banbury, Oxfordshire, and Henry Hoghton, Esq., of Bold, near Warrington, Lancashire, were elected Governors, and the following gentlemen Members of the Society:—

Whittam, James Sibley, Mayor of Coventry
Mundy, Chas. John Henry, Mavis-Enderby, near Spilsby, Linc.
Bassill, Robert, Flamstead House, Redbourne, Herts
Lysons, the Rev. Samuel, Hempsted-court, near Gloucester
Child, Thomas, Mickelham Priory, Hartshorne, Sussex
Carnegie, the Hon. J. J., Fair Oaks, near Petersfield
King, John, The Grove, Exton, Alton, Hants
Strode, Jas. Cranborne, Brighton
Warde, Charles, Squerries, near Westerham, Kent
Beevor, Henry, Barnby Moor, East Retford, Notts
Rickaby, John, Ulrone House, Bridlington, Yorks.
Eddison, William, Huddersfield, Yorks.
Gibbons, William, Foxgrove-farm, Beckenham, Kent
Dandridge, Daniel, East Hendred, near Abingdon
Alston, Wm. Chas., Elmdon Hall, near Birmingham
Vivian, Edward, Torquay, Devon
Williams, Captain, Torquay, Devon
Elliott, Jonathan, Sonning, near Reading, Berks
Pelly, Richard Wilson, Upton, Essex
Webb, William, Haselor, near Tamworth, Staffs.
Pain, John, Houghton, near Stockbridge, Hants.
Dolphin, John, Hunter House, Edmondsbyres, Durham
Roddam, Joseph, Newton-Stanhope, Weardale, Durham
Grosvenor, The Earl, Grosvenor-square, London
Roach, John, Perreton, Newport, Isle of Wight
Brook, James, Park Farm, Brading, Newport, Isle of Wight
Wavell, William, Lake, Newport, Isle of Wight
Sclater, Wm. Lutley, Hoddington House, Odiham, Hants
Atkinson, Joseph, Grazing-nook, Bedale, Yorkshire
De Berg, M., Secretary to the Russian Embassy in London, 30, Dover-street
Pope, John Allen, Clifton Farm, near Yeovil, Somerset
Johnson, Francis Dixon, Aykley Heads, Durham
Wilkinson, Percival Spearman, Mount Oswald, Durham
Cooper, Wm. W., Barningham Park, Ixworth, Suffolk
Courtney, Thomas, Stratton, Andover-road, Whitchurch, Hants
Bailey, Frederick, Mitcheldever, Andover-rd., Whitchurch, Hants
Shearer, Bettesworth Pitt, Swanmire House, Bishop's Waltham, Hants
Hornby, Rev. Robert, Walton-le-dale, Preston, Lancashire
Birchall, Thomas, Ribbleton Hall, Preston, Lancashire
Knollys, Colonel, Blount's Court, Henley-on-Thames
Darnel, Thomas Smith, St. Neot's, Huntingdonshire
Smith, Charles H., Gwconlluuynwyth, near Swansea, S.W.
Delgairns, W., Guernsey
Roe, Freeman, 70, Strand
Tredwell, John Clark, Oddington Grange, Bicester, Oxfordshire
Cracroft, Colonel, Hackthorn, near Lincoln
Thew, Edward, Lesbury House, near Alnwick, Northumberland
Linn, William, Broomhill Tile Works, Felton, Northumberland
Warry, Elias Taylor, Lyndhurst, Hants
Watts, Robert, Battle, Sussex
Langdon, Augustus, Cold Harbour, near Tonbridge, Kent
Cartlich, Thomas, Chill Lodge, Tunstall, Newcastle, Staffordsh.
Williams, Thomas, Brecon, S.W.
Tilly, Harry Tobias, Tremough, near Penryn, Cornwall
Greaves, James, Radclive, near Buckingham
Smith, Chas. Robert, Collingbourne-Ducis, near Marlborough
Maton, Leonard Pitt, Collinbourne, near Pewsey, Wilts
Mason, Richard, Round, near Leominster, Herefordshire
Fowler, Marshall, Preston Hall, near Stockton-on-Tees, Durham.
Shrimpton, John, Easton, near Winchester
Davies, James, The Green, Aberystwyth, S. Wales
Dixon, Thos. John, Holton, near Caistor, Linc.
Molyneux, Jas. More, Losely Park, near Guilford, Surrey
Shuter, T. Allen, Hooley House, Coulsden, near Croydon, Surrey
Brandrane, John B., Beckenham, Kent
Bigg, John, Stanstead-Abbot's, near Hoddesdon, Herts
Hole, James, Knowle House, Dunster, Somerset
Hunt, John, Shirley, near Southampton
Cole, Thos. Henry, The Green, Wick, near Bath
Broderip, Edmund, Manor House, Cossington, near Bridgewater
Williams, G. M., Brocklesby, Great Limber, Linc.
Rawlins, George, Lee House, Romsey, Hants.
Wedlake, Mrs., Hornchurch, Essex
Whitaker, William, The Ash, Etwall, near Derby
Butler, John, Caerleon, Newport, Monmouthshire
Empson, Henry, West Ravendale, Binbrook, Spittal, Linc.
Hutton, Thomas, Upton-Gray, Odiham, Hants.
Cock, William, Courtledge, Appledare, Tenterden, Kent
Sykes, Edmund, Mansfield Woodhouse, Notts.
Wooldridge, Henry, Meer-Stoke, Bishop's-Waltham, Hants.
Wooldridge, Jas. Wm, Webb's Lane, Wickham, Hants.
Cunynghame, John, Hensol, Castle Douglas, N.B.
Parkins, Edward, Chesfield Lodge, Stevenage, Herts.
Hart, Thomas, Wing, near Leighton-Buzzard, Beds.
Piper, John D., Colne-Engain, Halsted, Essex
Dixon, Thomas, Darlington, Durham
Coles, Lieut.-Col., Woodcote, Alresford, Hants
Rowland, William, Ramsbury, Hungerford, Berks
Bennett, Absolam, Mertyn-hall, Holywell, Flintshire

Mr. Langdale presented a new variety of Prolific Dwarf Pea; Mr. Wood, a specimen of Alexandrian Lupine; the Duke of Richmond, the second report of the Morayshire Farmers' Club, on the result obtained in the application of bones and sulphuric acid employed as a manure; Mr. Fleetwood, samples of the fibres of Sunflower stalks; Messrs. Kerr and Green, details on the sizes and prices of their iron-grated tile-ends, for preventing the entrance of vermin into drains; Mr. Baines, a communication on the modes of preserving milk; Mr. Stronge, a case of protracted gestation in a cow; Mr. Bellairs and Mr. Cochrane, papers on the economical collection of manures; Mr. Blurton, on his invention of a metallic churn; Mr. Charnock, papers relating to the Yorkshire Drainage Society; and Mr. Meyer, on the destruction of insects injurious to Agricultural crops. The Council then adjourned, over Ash Wednesday, to meet again on the 28th of Feb.

HIGHLAND AND AGRICULTURAL SOCIETY.

A monthly meeting of this Society was held on Feb. 7, in the Museum—Lord Rosebery in the chair. The first paper read was a report of analysis made of the ashes of peat from Berkshire, and from Kinblethmont, the seat of Mr. Lindsay Carnegie, in Forfarshire. Mr. Carnegie having tried, as a manure, the ash obtained from his own peat by burning, and finding it to produce none of the good effects attributed to the peat-ash of Berkshire, but on the contrary, to act as a poison to plants, Mr. Colvill undertook the analysis of the ash of both descriptions of peat, in order to detect any appreciable difference in their constituents, and this report is the result of his investigation: the elements of both ashes were found to be nearly alike, but the Kinblethmont ash contained sulphur and phosphorus in combination with iron, which the other did not, and which combination seemed to have produced the poisonous effects upon the plants observed by Mr. Carnegie. Besides this communication, a letter was read from Mr. Carnegie, descriptive of an experiment made by him with a manure denominated by Mr. Colvill a double ammoniated magnesian salt, which is stated by Liebig to be an essential constituent of the Potato. The experiment was tried in the garden, and the result was as follows:—1 drill 38 feet long by 27 inches wide, with 2½ pints gave 4 stones 7 lbs., or 14 tons 6 cwt. per acre; the same extent, with 2 pints and 20 loads of dung per acre gave 4 stones 7 lbs., or 14 tons 6 cwt. per acre: with 2 pints only, it gave 4 stones 11 lbs., or 15 tons 4½ cwt. per acre; while without manure it gave 2 stones 4 lbs., or 7 tons 7 cwt. per acre. This substance is prepared by dissolving bones in muriatic acid, adding Epsom salts, and precipitating with excess of gas-liquor. Lord Strathmore then read a paper, in which, after noticing the neglect of peat-ashes, he described their value and utility as manure. It appeared from his Lordship's statement that the quantity, and most probably the quality, of peat-ashes, depend on the mode in which the peat is calcined. When peat is burned in the open air, a small quantity only of ash is obtained, some of the valuable properties of which are moreover suffered to be dissipated; but when the better sort of peat, which is that found at some distance below the surface, is cast at the proper season, dried, and burned in a kiln covered at the top, with a quick draught, the ash is greater in quantity and superior in quality, and the process is attended with little cost. When from 20 to 30 bushels of ashes obtained in this manner are spread upon an acre of green sward, they will produce as much herbage as a corresponding quantity of soot, at one-sixth the cost; and when such ashes are mixed with lime or fine sand, they are not only a superior top-dressing for upland or other meadows, and for Red Clover without Rye-grass, but they also prove a valuable manure for Carrots, Parsnips, or Mangold Wurtzel, on strong soil; his Lordship stated that one ton of peat, burned in a close kiln, would yield 14 bushels of ash. A communication from Mrs. Davies Gilbert of Eastbourne, Sussex, on the allotment system, was then read, in which she proves that in her system of allotting land five acres suffice for the support of one family. The last paper, which was read by Mr. J. Hall Maxwell, related to experiments with special manures, conducted by the land-steward of Mr. Fleming, of Barrochan. It formed the report for which the second premium of 30*l.* was awarded to the essay-competition of last year. We can only notice a few of the more important conclusions at which the author arrived. He found that the nitrate of soda and potash, when applied by themselves, or in mixture, are beneficial to Potatoes and hay; but when applied to grain crops, especially singly, they are positively

injurious in a moist climate, as, though the growth of straw is greatly increased by them, the sample of grain becomes lighter and otherwise deteriorated. He considers it probable that the silicate of potash would counteract this effect. Common salt, at a distance from the sea, is advantageous to grain crops as respects colour and plumpness, and also to Grass and hay, although it does not cause a rush of growth like the nitrates. Soot differs little from nitrates in its effects on Grass intended for hay, but the dealer in hay gives less price for hay raised by soot. Sulphate and muriate of ammonia have the same effect as the nitrates. Sulphate of soda and magnesia act differently, and will not pay in most cases when applied by themselves to Potatoes or grain, but they do well when mixed with the nitrates. Guano may be successfully applied to every species of crop in the field or garden, and it always proves a most powerful auxiliary to farm-yard dung.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

At the meeting of the Council on the 8th inst., the Secretary presented a return of the receipts and expenditure incurred at the late Cattle show at Belfast, whereby it appeared that the sum of 1762*l.* had been received by the sale of tickets to the entertainments, entrance to the show-yard, and fees upon the entry of stock, &c., and that a sum of 1593*l.* had been subscribed in different counties in the province of Ulster for the purpose, making a total of 3355*l.* received upon that occasion. It appeared also that the sum of 2954*l.* had been expended in the erection of the pavilion and show-yard, giving the entertainments, and in all the other incidental expenses, including a net sum of 500*l.* paid to the central society towards the payment of premiums, leaving a balance of 401*l.* in favour of the local committee, after defraying all the expenses of that great meeting. The Secretary stated that he had addressed a circular to the different members of the council, to the effect, that inasmuch as Mr. Hill, the owner of the prize Bull "Eden," at the cattle show at Belfast, had declined to comply with the proposal of the council for a re-adjudication, upon the terms long since communicated to him, the opinion of the full council should be taken as to what proceedings should be next adopted, for the purpose of bringing the matter to a final close; and that a special meeting of the council should be summoned for Thursday the 15th of February next, to take the subject into consideration. A letter was read from the Earl of Listowel, stating his conviction that the cause of Agriculture can in no way be so well promoted as by the employment of intelligent and competent Agriculturists upon private estates. A letter was read from Sir Richard O'Donnell, Bart., stating that it was his intention to place a premium of 12*l.*, or a gold medal or a piece of plate of that value, at the disposal of the Society, "for the landlord in Ireland who shall have thorough-drained on the farms of his tenants, or induced his tenants so to do, the greatest quantity of land, not less than 100 statute acres, upon Mr. Smith of Deanston's principles, in the years 1843 and 1844." Letters were read from the secretaries of various local societies, sending in the names of a sufficient number of members to the central society, to qualify them for the society's premiums this year.

FARMERS' CLUBS.

Bromsgrove.—At a meeting of this Club, held in the Town Hall, Bromsgrove, on January 30th, the Report for the year 1843 was read, from which it appears, that at the formation of the Club on the 20th June, 16 members were enrolled, but that the number has increased to 58. The objects proposed in its establishment were the diffusion of information on Agricultural subjects, and the promotion of Agricultural improvement. For the fulfilment of these objects, a meeting is held each month, at which some subject connected with Agriculture, is brought forward for consideration; elementary lectures on subjects connected with the theory and practice of Agriculture are occasionally delivered; and the surplus funds of the Club are applied to the purchase of books for the formation of an Agricultural Library. At the first meeting an introductory lecture was delivered by Mr. H. F. Fardon, "on the Advantages of Association for the improvement of Agriculture," in which the history of English agriculture was briefly given, its present importance enforced by reference to statistics, the duty and interest of nations and of individuals with respect to its improvement examined, the possibility of improvement urged, and the means of improvement inquired into; these are a remunerative price of produce, such equitable and proper arrangements between Landlord and Tenant as shall induce the latter to cultivate the ground in the best possible manner for the interests of both; and lastly, skill and knowledge in the farmer, to be communicated by proper education, and promoted by association. At the next meeting "the advantages of lime as a fertiliser of land" were considered. All plants grown by farmers contain lime in a greater or less degree, which they must absorb from the soil. In a caustic state lime combines with acids in the soil, and some of the compounds thus formed are serviceable as food to plants. It also decomposes certain noxious compounds of iron, &c., which frequently exist in the soil, but it differs in its action according to the state in which it is applied. It hastens the decomposition of vegetable and animal matter, and thus has a tendency to exhaust the soil of these ingredients.

Two lots of Potatoes were exhibited at the meeting by Mr. Elliot, each containing the produce of six roots. They were grown near together under similar circumstances, each receiving a dressing of farm-yard manure. When up and moulded, a small portion of carbonate of soda was sown between the ridges of one lot, at the rate of 150 lbs. per acre. The lot undressed with soda weighed 2 lbs. 2 oz.; that which received soda weighed 4 lbs. 6 oz. The subject of Seed Wheat, and the best method of pickling and planting the seed, afforded matter for discussion at several subsequent meetings, at which it was resolved, "That there is an adaptation in different varieties of Wheat to different soils; and that the practice of annually changing the seed from one soil to another is a good one; and that arsenic, sulphate of copper (blue vitriol), and salt, have been used with much success in the pickling of Wheat for the prevention of smut." A Paper on "Wheat Sowing" was communicated at one of the meetings by Mr. Richard Smith, of Upper Hall, near Droitwich. On strong clay soils, that moulder and heave after hard frosts, he approved of sowing broadcast and ploughing in from 2½ to 3 bushels per acre, the land being previously fallowed, because greater space is thus afforded for the roots. More seed, however, is thus required, and the crop cannot be so well cleaned. By drilling again, the seed is deposited at an equal depth, but the plants are crowded and the water is retained in the narrow channels made by the drill-share, particularly on strong soils and where the drilling is done lengthwise of the ridges. Mr. Smith recommends Lord Western's system of drilling, which is to have the heel of the common drill-share made four inches in width to scatter the seed that width in the row; a space of nine inches is left between the rows for tillage. Dibbling is the most perfect system, and will probably spread and become universal as population increases. All these remarks suppose the ground in a good state of cultivation, for if it is wet, foul, or poor, Wheat cannot be grown without loss.

Arrangements are about to be made by this club for the delivery of elementary lectures to the members, and the formation of a library has been commenced, and it is hoped that a lecture will shortly be delivered by Mr. Smith, of Deanston. It is also intended to institute a ploughing match. The report, of which the above is an abstract, having been read, Mr. Wright read a paper "On the Utility of Leases," advocating well-adjusted leases on Corn-rents. In arranging these rents, the price of Corn should be calculated on an average of a certain number of years. The rent of a particular year should not be founded merely on the prices of that year; otherwise, the tenant may have the highest rent to pay when he has the least produce. A resolution was adopted by the club, expressive of their opinion, that the only sound system for tenancy of land is on the principle of leases for 7, 14, and 21 years on Corn-rents.—*H. F. Fardon, Sec.*

West Firle.—At the annual meeting of this Society on Jan. 31st, the report for the past year was read. At the meeting, which took place on the 11th of September, the subject discussed was, "The advantages of drawing off Turnips, or feeding them on the ground." The chair was taken by John Ellman, Esq., president, who opened the evening's conversation by giving his views upon the subject, and upon this the resolution of the evening was chiefly founded, viz., "That no general rule can be laid down as to feeding Turnips on the ground, or drawing them off to be consumed in sheds or yards. That on dry light soils where sheep can feed them, treading is advantageous; but on more tenacious soils the Barley crop is frequently injured by the treading of sheep—still there can be no doubt, that in fattening sheep, one acre of Turnips will produce much more mutton when consumed in warm yards and sheds, than when fed on the open ground."

Miscellaneous.

Specific Manures are frequently capable of adding one or two substances only to the soil. It is evidently, therefore, of primary importance to ascertain, in the first place, whether the soil really requires the substance; for it is impossible that any specific can be valuable when applied to soil already abundantly supplied with the very substance it is intended thus to add to the land; in this instance, there must result either no effect or an injurious one, and in consequence, in both instances, disappointment. Let us take an example: nitrate of soda has been much and deservedly praised as a manure, and it has almost universally been declared to be equal to, and to act in a similar manner with nitrate of potash (saltpetre), in which case it would have the advantage of greater cheapness to recommend it. But in the above statement it is quite forgotten that the manure acts in two distinct ways: 1st, as a nitrate; 2d, as containing soda. Now, as regards the first action, viz., as a nitrate, these two salts can replace each other without the least difference in their action; but as respects the second mode of action, viz., the supplying the plant with soda, it is clear that they differ as distinctly as saltpetre does from common salt; and practice has proved this, for in more than one instance a considerable difference has been shown in the result obtained by the two manures. Thus, Prof. Johnston mentions the following result of an experiment at Erskine, near Glasgow, in 1841, upon Hay, with the two nitrates, in two different fields—the one being a light soil, the other a clay. In the light soil the nitrate of soda produced 3 cwt. more Hay per acre than the saltpetre, whereas, on the clay, the saltpetre exceeded the nitrate of soda by ¾ cwt. nearly; and it is well worthy of remark, that common salt, another compound of soda, was also employed in both cases, but yielded exactly 5 cwt. more upon the sand than on the clay; thus proving, we think, as well as a chemical analysis of the soil could have done, that the clay soil contained naturally more soda than the sand, and likewise probably that the sand was richer in potash. A similar case is likewise mentioned by Dr. Daubeny, of Oxford, where the nitrate of potash exceeded the nitrate of soda upon Wheat by upwards of 4 bushels per acre, and in which case the nitrate of soda produced no effect whatever; in fact, an equal portion of soil, without any top-dressing, produced 24 lbs. more grain than that upon which the nitrate of soda was used.—*Dr. Madden, on the Advantages of Extended Chemical Analysis to Agriculture.*

Improved Modern Husbandry compared with the Old System.—I. *Old System.*—Statement, showing the expense of the cultivation, together with the return from, an acre (Scotch) of cold, stiff soil, with a hard retentive subsoil, before improvement by draining, &c.; lease for 18 years; rent 25*s.* per acre.

Expense of a Six Years' Rotation.

	£	s.	d.
60 bolls lime, at 10*d.* per boll	2	10	0
Carting and spreading	1	10	0
First crop,—ploughing, seed, and harrowing	1	18	0
Second ditto ditto	1	15	0
Grass seeds and harrowing	0	10	0
Rent for six years, at 25*s.*	7	10	0
	£15	13	0

Return of a Six Years' Rotation.

6th, ditto ,,	1	0	0
	£17	11	0

The same repeated till the end of the lease, the land getting worse instead of improving.

Statement showing the expense of improvement, cultivation, and return from an acre of the same land, during a lease of 18 years; rent the same.

Expense of the first Six Years.

	£	s.	d.
Draining with tiles at 15 feet interval, 25 inches deep; tiles, 21*s.* per thousand	7	0	0
Lime, carting and spreading	4	0	0
Ploughing, harrowing, and seed	1	18	0
Second crop—ploughing, harrowing, and seed	1	16	0
	£14	14	0

Expense of Green Crop, viz.—

	£	s.	d.	£	s.	d.
Subsoil and other ploughings	4	0	0			
Grubbing, horse-hoeing, and weeding	1	10	0			
Dung, 10*l.*; lime, 1*l.* 5*s.*	11	5	0			
				£16	15	0
Ploughing for Wheat and seed				2	6	0
Grass seeds, harrowing and rolling				1	5	0
Rent for six years, at 25*s.*				7	10	0
Interest on expense for draining for five years, at 5 per cent. per annum				1	15	0
				£44	5	0

Return of the first Six Years.

	£	s.	d.
1st, 8 quarters Oats (with straw)	10	0	0
2d, 8 ditto (ditto)	10	0	0
3d, Potatoes, 1-3d; Turnips, 2-3ds, at per acre	11	0	0
4th, 4 quarters Wheat, at 60*s.*	12	0	0
5th, 150 stones hay, at 3*l.*; foggage, 5*s.*	4	15	0
6th, Pasture, at per acre	2	0	0
	£49	15	0

Expense of the second Six Years.

	£	s.	d.
1st, Ploughing, harrowing, and seed	1	12	0
2d, Ditto, ditto, ditto	1	10	0
3d, Green crop without subsoil-ploughing	12	0	0
4th, Ploughing for Wheat and seed	2	4	0
5th, Grass seeds, harrowing and rolling	1	5	0
Rent for six years, at 25*s.*	7	10	0
Interest on draining, six years	2	2	0
	£28	3	0

Return of the second Six Years.

	£	s.	d.
1st, 9 quarters Oats (with Straw)	11	5	0
2d, 9 ditto ditto	11	5	0
3d, Green crop—at least	12	0	0
4th, 5 quarters Wheat, at 60*s.*	15	0	0
5th, 200 stones Hay, at 3*l.*; foggage, 5*s.*	6	5	0
6th, Pasture, at per acre	2	0	0
	£57	15	0

The expense and return of the third six years will be much the same as that of the second.

ABSTRACT I.—*Unimproved Land.*

	£	s.	d.
Expense during a lease of 18 years	£46	19	0
Return ditto ditto	52	13	0
Profit per acre during the whole lease	5	14	0

II.—*Improved Land.*

	£	s.	d.
Expense of the first six years	44	5	0
Ditto second ditto	28	3	0
Ditto third ditto	28	3	0
	£100	11	0
Return of the first six years	49	15	0
Ditto second ditto	57	15	0
Ditto third ditto	57	15	0
	£165	5	0
Profit per acre during the whole lease	64	14	0

The above system of cropping is not one to be generally recommended; it is merely adopted as the basis of the above calculation because it is generally followed.—*Statement made by Mr. Smith of Deanston, at Bristol.*

Guano Contract.—The following is an extract from a translation of the Guano contract, to which much attention has of late been directed:—Art. 1. The company, (Messrs. Quiros, Allier, and Co.; Gibbs, Crawley, and Co.; and Puimiroll and Co.,) has the exclusive privilege of exporting abroad the guano of the islands and other places where it is produced, as discovered, or to be discovered, for the period of four years, obligatory upon all the contracting parties from the present date. Art. 2. The quantity of 20,000 tons is assigned for the extraction of each year of the four years expressed in the preceding article, with the privilege of exporting the following year that which shall not have been exported in the year to which it corresponds; but, at all events, 80,000 tons shall be exported in the four years. Art. 5.—The state places for its capital in the company the guano at the value of 30 dollars the ton. Art. 6. The contractors place for their capital their industry and labour, and shall advance for account of the association all the expenses of getting the guano, loading, insurance, freightage, commission of shipping and of sale, and other expenses caused by the business as well in Peru as in the markets of consumption. Art. 7. From the produce of sales of the guano are to be deducted the costs, freights, insurances,

expenses, &c., and the capital assigned of 30 dollars per ton, and the result will give the amount of profit or loss, which is to be divided in the manner following: three-fourth parts for the State, and one-fourth part for the contractors. Art. 15. For the present the extraction of guano is alone permitted in the Island of the North (*Isla del Norte*), in those of Chincha. Art. 22. The exportation of guano being, according to the first article of this contract, the exclusive privilege of this company, the Supreme Government binds itself not in any case to dispose of any quantity whatever, whether in the shape of recompense, sale, gift, or in whatever mode; nor to permit its exportation by any person not of the association during the four years applicable to the contract.

Notices to Correspondents.

OUR CORRESPONDENTS will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

ACCOUNT BOOK.—*A Subscriber and Farmer.*—If you or the publishers will send or lend us a copy of the Work referred to, we shall be happy to give an opinion of it.

BEANS.—*A Yorkshire Subscriber.*—You might with advantage mix guano with the dung before putting it in the drills, at the rate of two cwt. to such a quantity as you intend to put on an acre.

BEST WAY OF APPLYING SOLUBLE SALTS TO LAND.—*An Amateur.*—Dissolve them in water. The least quantity which will dissolve the weight of salt you wish to apply to an acre, will do equally well with any larger quantity, provided you can spread it uniformly over that extent of land. If your water-cart will, when in ordinary work, spread so many gallons per acre, then your plan is, to dissolve in that number of gallons the quantity of the salt which you wish to apply per acre. These salts may be advantageously applied now. You had better give your heifers some Swedes or M. Wurzel along with the Hay.

BOOKS.—*North Cheam.*—Low's "Elements of Practical Agriculture" is the best work on Farming in our language. Cuthbert Johnson's "Encyclopædia of Agriculture" is one of the best of its class.

BREED OF PIGS.—*S. Prockter.*—We do not know the Rudgewick breed of pigs, but perhaps some of our readers, seeing this notice, may be able to inform you through us whereabout "in Surrey or Sussex" they are to be obtained.

BURNETT'S ANTISEPTIC SOLUTION.—*A Subscriber.*—We do not know it.

DIBBLING OATS.—*L. T.*—We never heard of Oats being dibbled. What is true of Wheat on this subject must, however, be true also of Oats; the only question is whether the less value of seed saved will more than pay the same additional cost of this mode of sowing.

ESSAY ON DRAINAGE.—*E. Barnard.*—Mr. Arkell's Prize Essay is not published in a separate form.

FATTING OXEN.—*Govyn.*—If you intend giving your cattle *all* these things, let them have, say, 2 lbs. of oil-cake, 5 lbs. of Barley-meal, and 5 lbs. of Hay-chaff, with Swedes *ad lib.* Mr. Warnes, of Walsingham, Norfolk, is the person to apply to on a subject like this; he manufactures a composition for fattening cattle, by which it is said that beef may be grown more cheaply than by any of the ordinary methods of feeding. Foreign oil-cake is quoted at per ton, and not at per 1000 cakes, because the size of the cakes differs very much. You will find a plan of a piggery at No. 3 of the *Agricultural Gazette*, reference to the letters on which having then been accidentally omitted we now supply. F, F, F, F, farmyard; R, R, R, roads; A, A, A, shed, with yard in front for store-pigs; T, tank for drainage of sties, yard, and sheds; S, steaming room; the double row of sties below the steaming-room are for the fatting pigs, two being fed in each; and the single row at one end of the steaming-room are for a boar and six brood sows.

GAS-LIME.—*A. B.* will find information on this point if he looks over this section of this and previous Nos. of the *Gazette*.

GAS-WATER.—*Wem.*—The salts of ammonia in gas-water will differ with different qualities of coals used for making the gas. In some cases the liquor contains much sulphate and but little carbonate; whereas in others the latter predominates, and when this is the case, and gypsum is at hand, the sulphate of ammonia may be produced by its agency (the mineral being added in powder to the liquid), but the addition of sulphuric acid is the best and certain road to the formation of this salt, in whatever state the ammonia exists. Boil to a pellicle and crystallise.

GLOSSARY OF SCIENTIFIC TERMS.—*Literalis.*—If we understand you right, this is what you want. We shall take the subject up in some future Number of our Paper.

GORSE.—*Charles Etheredge.*—Information on this subject has been published in this and last Paper. We hope to be still more explicit on the points you refer to shortly. Mr. Ransome has a Gorse-crusher, and a Chaff-cutter applicable to the cutting of Gorse may be had at Uley Iron Works, Gloucestershire.——*Tuesday.*—Furze grows in nature on "wettish clay land," perhaps because it has been eradicated from all the better description of land. It prefers a dry loamy sand.

HORSE-PONDS.—*J. R.*—Undoubtedly, cattle should be supplied with *clean* water. We shall endeavour to obtain for you a statement of the *medicinal* properties of that which we often see in horseponds, discoloured by the runnings from the stable, cow-houses, &c.

LIME.—*Creta-crementa.*—You state the results of an experiment which was favourable to the plan you propose; facts, such as you detail, are safe as guides, though present theory may not explain them. In applying lime to your meadow-land, make a compost of it when caustic, with a lot of vegetable mould, and let it remain till it slakes. You may apply so much per acre of the compost as contain, say 100 bushels of lime, early in spring on your grass-land, and it may also be applied with advantage to your arable land. Clays generally require a greater dressing of lime than light soils.

LIQUID MANURE.—*C. E. F.*—Your tank might be 6 feet deep and 9 in diameter, flagged or paved at bottom, and with ordinary stone and mortar walls. It is certainly worth your while to adopt means of this kind to save the liquid manure.

MANURES.—*Economist.*—Cloacine should be mixed with black turf-ashes and dry earth, and after a while you will be able to drill it.——*Constant Reader.*—Horse-flesh must be greatly more valuable than woollen rags as manure, but *how much* more so we do not know. Bones are generally spread or drilled by themselves without mixture. Sulphuric acid would not reduce large bones to a pulp (see article on this subject in our Home Correspondence). We shall answer your question about tithe-charge next week.——*W. H. B.*—Substances employed to mix with artificial or condensed manures are of two kinds: viz., such as are intended merely to dilute them as it were, so that by their addition, there being a larger bulk to apply to the land, we may be able do so more uniformly; and such as really increase the value of the manures they are mixed with. The sand you propose to mix with the guano may belong either to one or other of these two classes: if it be ordinary sea-sand, it is of the first kind, and earth from the surface of the field would answer your purpose much better; but if it be such as is found on the northern coasts of Cornwall, 60 or 70 per cent. of which is carbonate of lime, the sand itself being chiefly comminuted sea-shells, then it belongs to the second class, and may be usefully employed as you propose, especially if the land you are about to manure be deficient in calcareous matter. In the latter case you may advantageously apply six or eight cart loads of this sand per acre, and you will have to mix your 2 or 3 cwt. of guano through it all.

MANAGEMENT OF GRASS-LAND.—*Warricus.*—We always feed our young seeds down close in autumn with sheep, and consider the manuring they thus receive does them good; and probably this management would suit permanent pasture also.

MARL.—*J. Yorke.*—Your specimen will probably be valuable as a top-dressing for land deficient in calcareous matter. It appears to be almost wholly carbonate of lime; but you will find, by reading Sprengel's articles in this Paper, that the value of marl frequently depends on the existence in it of matter, whose presence can only be detected by a tedious analytic process.

MARKET FOR FEEDING STOCK.—*J. Clark.*—Romford-market, in Essex, is one of the best in England for stock; during the autumn and spring months great numbers are offered weekly for sale, and are mostly purchased for fattening.

MOSS-LAND.—*A Tees Farmer.*—Judging merely from the information you give, we advise you to pare and burn this land; break it up, take a crop of Turnips off it, working the land well during their growth, and lay it down to Grass along with the succeeding crop of Barley. It is no good trying to *tear* the Moss out.

PEAS.—*Govyn.*—Peas prefer light soils, but they may be grown on stiff soils, like the Bean; if, after ploughing, your land gets well frozen, then it will harrow down well, and you may drill the seed in with the Suffolk drill, in rows, say, 9 inches apart.

POTATOES.—*A Constant Subscriber.*—Place the dung in the rows, and if it is well rotted, you may use the horse-hoe to mix it with the bottom earth of the furrow. Plant the Potatoes in the loosened earth, and then hoe or plough the drills down to cover them. It will take about seven sacks of Potatoes to plant an acre.

QUANTITY OF GUANO PER ACRE.—*Tuesday.*—In ordinary cases, 3 cwt. per acre. Mix it thoroughly with the soil before sowing. The quantity required depends upon the present condition of the land.

SOILS.—*J. Marshall.*—If your soil is similar in character to the specimen No. 1, the clay, then we doubt not that it would be greatly improved by a dressing of No. 2, the calcareous sand you sent. The clay, No. 1, is not a marl; it contains hardly any lime, and would do very well to make tiles and bricks of. No. 2 contains at least 30 per cent. of lime; and rather than send 12 miles for lime, you had better try a good dressing of this which is at hand. If you resolve to do this, please to let us know the result of the application. As for the sulphureous smell you speak of, the cause might be ascertained by an accurate analysis of the material from which it arises; *i. e.*, if you are not mistaken in its existence.

STEEPING OF SEEDS.—*Gentleman Farmer.*—Mr. Campbell informs us that "after steeping the proper time, the grain is to be taken out and spread to dry under a current of atmospheric air (not by heating). The time of steeping for Wheat may extend to 84 or 90 hours; for Oats, 68 to 72 hours; for Barley, from 58 to 60 hours; for Grass-seeds, from 14 to 16 hours; for Rye, 70 hours; for Beans and Peas, from 18 to 20 hours; for Turnips and Rape-seed, from 10 to 12 hours. The grain must not be kept in a wet state after being taken out of the liquid; but the drying must commence immediately. When sown, much less seed must be used than is commonly done, as the plants tiller into numerous stems."——*Oakley.*—The Leasing Article in No. 4, and Mr. Campbell's answers above, will probably serve your purpose. We doubt if soaking Potatoes would be beneficial. The experiment had better be tried now with one in a flower-pot; see if it sprouts vigorously there, before trying the plan in the field.

STALL-FEEDING.—*G.C.*—Next week.

STALL-FEEDING OXEN.—*W. T.*—In East Lothian it is generally considered better to adopt the system of hamels, as they are termed, *i.e.*, to place fatting oxen two and two in small yards, each with a shed, rather than tie them up singly in a feeding-house. By this means, in addition to the greater comfort of the animals, and the consequent greater rapidity of fattening, the farmer is enabled to get his straw trod into dung more rapidly.

SWEDES ON CLAY-LAND.—*H. S.*—We suppose the land is dry. Cultivate it and manure it in autumn, and leave it rough for the winter's frost. Scarify and stir it 4 or 5 ins. deep in spring, as often as it is necessary to bring it to a tilth; beat it up towards the end of May in drills 26 ins. wide, and sow.

TASK-WORK.—*Midland County.*—We shall endeavour to put your plan in execution.

TOLL EXEMPTION.—*E. A. P.*—We think the decision of the Borough Magistrates was wrong. The exemptions in the Acts are to be construed liberally in favour of Agriculture; and without resorting to a forced construction, we think the peat under the circumstances described would be exempt under either of the terms, "soil" or "manure."

TRENCH PLOUGHING.—*A Subscriber.*—It is rarely advisable to plough below the full depth of the active soil. Your best plan, if your land is well drained, is to subsoil-plough it once every fourth year, and by and by the soil will become mellow to a great depth, and then you may trench-plough it with advantage. Your suggestion with regard to an article on manure shall be attended to.

*** As usual, many communications have been received too late for answering this week.

Markets.

SMITHFIELD, MONDAY, Feb. 12.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s 10	to 4s 2	Best Downs & Half-breds	4s 2	to 4s 8d
Best Short Horns	3 6	3 10	Best Long-wools	4 0	4 4
Second quality Beasts	3 0	3 4	Ewes and second quality	3 6	3 10
Calves	4 0	4 10	Pigs	3 8	4 4

NUMBERS.—Beasts, 2768; Sheep, 22,930; Calves, 61; Pigs, 270.

Although the supply of Beasts continues very moderate, trade is heavy at our late quotations, in consequence of the large arrivals and dull sale at the dead markets. Mutton is again in less quantity, and a brisk demand at an advance of full 2d per 8 lbs. on heavy-wooled Sheep; but the best Downs do not make a proportionable progress, there being much greater numbers of them and of Half-breds from Norfolk, than of other kinds, and it is only in very selling ones that our highest quotation is realised. Veal is a heavy trade, at a reduction of fully 2d per 8 lbs. Pork remains steady.

FRIDAY, Feb. 16.

We have to day a very heavy trade in all kinds of stock, at reduced prices. A large supply of Beef and Mutton, changeable weather, and very depressed state of the dead markets, have combined to produce this effect with regard to those articles. The best Beef cannot be quoted at more than 3s 8d to 4s, the best Downs, &c., 4s to 4s 6d; and other qualities suffer in the same proportion. Calves are not quite so plentiful, but we cannot quote any advance, it being difficult to make 5s per 8 lbs of anything.

NUMBERS.—Beasts, 580; Sheep, 2950; Calves, 107; Pigs, 312.

41, West Smithfield

POTATOES.—SOUTHWARK WATERSIDE, Feb. 12.

DURING the early part of the past week our market was depressed, and there was but little demand, except for the best samples; other lots moved heavily, at terms of this day week. The demand for Early Devons has been very limited, the trade is gone off them very considerably, and 70s must still be regarded as nominal. The last two or three days the holders of the best Scotch Reds have been asking 70s, but few sales have been effected at that price; yet should we have a continuance of cold weather, it is expected that the annexed prices will be maintained.

York Reds	60s	to 80s	Kent and Essex Whites	55s	—
Perth	65	70	— — Kidneys	65	70s
Early Devons	65	70	Wisbeach Kidneys	65	—
Late Devons	70	—	— Blues	55	—
Cornwall	65	70	— Whites	50	55
Jersey and Guernsey Blues	60	—	Prince Regents	60	70

There have been several arrivals from Yorkshire, Scotland, Devonshire, and the Channel Islands on and since Saturday last, these, in addition to those we have on hand, will be rather a liberal supply.

WOOL.—BRITISH, FRIDAY, Feb. 16.

OUR Market continues in the same state as reported last week. With the exception of Kent Fleeces, no alteration has taken place in prices.

	per lb.			per lb.	
Long-wooled Wethers	1s 1d	to 1s 2d	Southdown Hoggitts	1s 1½	to 1s 2½
Do. Hoggitts	1 1½	1 3½	Kent Fleeces	1 2½	1 3½
Southdown Fleeces	1 0½	1 1½			

JAMES PEARSE, Wool Broker.

SEEDS, FRIDAY, Feb. 16.

— Cakes, Eng. per 1000	10l 5s	10l 10	Turnip (too variable for quotation).	

KINGSFORD AND LAW.

MARK LANE, FRIDAY, FEBRUARY 16.—The Market has been scantily supplied with English Wheat since Monday, which sold at the full prices of that day. Free Foreign is held for an advance, which renders the transactions limited; there is not much doing in Bonded, but the few sales effected have been at prices rather exceeding the late rates.—Fine Malting Barley is more in request, but we cannot alter our quotations.—Beans and Peas remain without alteration.—Oats are fully as dear, but business is not extensive.

KINGSFORD AND LAW.

COVENT GARDEN, FEB. 16.—THE supplies of most kinds of Fruit and Vegetables, during the week, have been tolerably good, and trade continues much the same as in our last report. Pine Apples are selling at nearly the same prices as last week, and little alteration has taken place in those of Grapes. Good dessert Pears continue to get scarce; Beurre Rance do not ripen well this season and are very liable to decay. English-grown kitchen and dessert Apples are rather scarce, and are advanced a little in price; but foreign ones, consisting principally of common sorts, are abundantly supplied. Oranges are offered at nearly the same prices as last week. Lemons bring from 6s. to 14s. per 100. Chesnuts are offered at nearly the same prices as in our last report. Among Vegetables, Cabbages are scarce; Brussels Sprouts are selling at from 1s. 6d. to 3s. 6d. per half-sieve. Broccoli continues scarce. French Beans are much the same as in our last report, as are likewise Greens. Celery has a little advanced in price during the week, as has also Endive, the latter is selling at from 1s. 6d. to 2s. per score. Seakale is good and sufficient for the demand. Asparagus is offered at from 2s. to 10s. per 100. Lettuces are selling at nearly the same prices as last week. Cucumbers bring from 4s. to 8s. each. A few of the Early Horn Carrot are offered at from 4d. to 8d. per bunch. Cut flowers chiefly consist of Erica gracilis, Burchellia capensis, Epiphyllum truncatum, Lachenalia tricolor, Æschinanthus grandiflorus, Azaleas, Acacias, Rhododendrons, Camellias, Cinerarias, Tulips, Primulas, and Roses.

FRUITS.

Willey Dust, 34s per ton	—

Expenses of shipping about 5s to 7s per ton, according to quantity.

MARK FOTHERGILL

RANUNCULUSES.

J. SUTTON AND SONS beg to offer the following:—

50 choice sorts, by name, a pair of each		£1	5 0
50 do.	one root of each	0	15 0
25 do.	a pair of each	0	13 6
25 do.	one root of each	0	8 6
Double Italian Tuberoses, per dozen		0	4 0
Ferrarias, or Tigridia pavonia, very strong Roots, per dozen		0	2 6

NEW FLOWER SEEDS.

75 most showy hardy Sorts (selected)		£1	0 0
50 do.	do.	0	15 0
25 do.	do.	0	7 6

KITCHEN GARDEN SEEDS.

Messrs. SUTTON and SONS respectfully solicit and recommend attention to the Collections of NEW KITCHEN GARDEN SEEDS which were advertised by them in the *Gardeners' Chronicle* of Dec. 30th and Jan. 6th. The Seeds are safely packed for conveyance to any distance, as they receive many Orders from Scotland and Ireland.

N.B.—Parcels delivered free to any of the Railway or Packet Offices in London, or to any part of the Great Western Railway, within 70 miles of London.

Catalogues may be had *gratis* at the Seed-shop, Nos. 7 and 8, Market place, Reading, Berks.

KENSINGTON NURSERIES.

RICHARD FORREST AND Co. beg leave respectfully to direct attention to their GENERAL NURSERY STOCK, which was never finer than this season, especially the extensive and correctly-named Collection of FRUIT-TREES.—See Advertisement for Nov. and Dec. 1843, of this Journal.

In consequence of the Lease of one of their Nurseries expiring, and being required for other purposes, R. F. & Co. deem it necessary to assure their Customers everywhere that it will not occasion the slightest interruption in their business. The Shop, Warehouses, &c. will remain undisturbed, and the ample provision which has been made in the adjoining Nurseries for this little change will insure the same supply, and attention to all the Customers, which they have uniformly experienced. To those who have visited the Nurseries recently, these observations are perhaps unnecessary; but to those who have not had an opportunity of witnessing the improvement of their Stock, R. F. & Co. consider this slight notice necessary to counteract any prejudice that might be raised in the minds of their numerous friends throughout these kingdoms and elsewhere.

TO GARDENERS AND BOTANISTS, &c. — As young Gardeners have often great difficulty in getting their specimens of the beautiful tribe of MOSSES correctly named, the Advertiser offers to assist them in the following manner:—If 20 of such will send their names and addresses as subscribers to the amount of *7s. 6d.* each, before March 10th, he will prepare 20 packets of Mosses, each containing 100 correctly named species, which will be sent, Post free, one to each subscriber, in April. A selection of examples of HEPATICÆ, LICHENS, FUNGI, ALGÆ, and ZOOPHYTES, will be ADDED to increase the usefulness of each packet. The money to be sent by Post-office order.—Address, W. GARDINER, 40, Overgate, Dundee. The offer not to be repeated if unfavourably received.

W. G. has also prepared a few 5*s.* packets, including 60 species of SCOTTISH ALPINE MOSSES, LICHENS, and HEPATICÆ; a few 5*s* packets of 30 named ZOOPHYTES or ANIMAL PLANTS; and a few 6*s.* packets containing selections of ZOOPHYTES, ALGÆ, and ALPINE MOSSES, LICHENS, and HEPATICÆ. Can be sent by Post. Early application necessary.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3*s.* 6*d.* each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

SHILLING'S EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the above PEA, the Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they, with confidence, recommend to the Public generally, being quite as early, and nearly double the size of any other Pea in cultivation. Quite hardy, will stand the winter well, and a good bearer; the pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 3*s.* per quart; 10*s.* per gallon; 17*s.* 6*d.* per peck; 30*s.* per half-bushel; 2*l.* 10*s.* per bushel. Agents:—Messrs. FIELD and CHILD, 119, Lower Thames-street, London; Messrs. W. and J. NOBLE, 152, Fleet street; Mr. KERNAN, 4, Great Russell-street, Covent Garden; Messrs. HURST and McMULLEN, 61, Leadenhall-street; Messrs. GRAY, ADAMS, and HOGG, Kensington; Mr. T. D. WATKINSON, Market-place, Manchester.—Northwarnborough Nursery, near Odiham, Hants.

GENUINE PERUVIAN & BOLIVIAN GUANO
ON SALE, BY THE IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL.
47, Lime-st., Jan. 31, 1844.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with synopsis of mode of use, on applications to MARK FOTHERGILL, 40, Upper Thames-street, London.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported,—Apply to COTESWORTH, POWELL, and PRYOR, London; EDWARDS, DANSON, and Co., Liverpool; or WILLIAM J. MYERS and Co., Liverpool, the Importers.

MANURE FOR GRASS, &c.—POTTER'S GUANO.

Testimonial of Lord Zetland, Dec. 2, 1842.

POTTER'S GUANO, 2 cwt. per acre, yielded of *Hay*	2 tons	8 cwt.	
Peruvian Guano, 2 cwt. per acre, yielded of *Hay*	1 ,,	18 ,,	
Difference in favour of Potter's Guano			10 cwt

BEAUTIFUL FLOWERS. — POTTER'S CONCENTRATED LIQUID GUANO, in quart bottles, 1*s.* 9*d.* each, at the principal Chemists and Seedsmen in town and country.

"I used POTTER'S GUANO on my Pansies; they were *much larger* than I ever had them before, and remained in full blow longer than I ever recollect. JOHN RITSON, Sunderland."

"POTTER'S GUANO will convert your desert into a paradise."—Professor LINDLEY, in *Gardeners' Chronicle*, 1843, p. 560.

Works, 28, Upper Fore-street, Lambeth.

For further testimonials see this Paper of the 6th Jan., 1844.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt.

Phosphate of Potash	. . .	15*s.* per cwt.
,, Soda	. . .	12*s.* ,,
,, Magnesia	. . .	9*s.* ,,
,, Ammonia	. .	1*s.* per lb.

GUANO.—Having made arrangements with Messrs. WM. JOS. MYERS and Co., of Liverpool, for a Cargo of this Manure direct from Peru, the Subscribers will bring the same into Berwick upon Tweed in all February and March.

Haddington, Feb. 9, 1844. BANKS and SON.

Note.—As this will be one of the very few cargoes from the Pacific, whose charterparties will admit of their discharging on this coast, BANKS and SON would recommend intending purchasers to apply for what they may require as early as possible.

TO AGRICULTURISTS.—IMPORTANT DISCOVERY.

"Quid faciat lætas segetes"—VIRGIL.

THE CORN-PRODUCING LIQUIDS.—"One of the most extraordinary exhibitions in the yard (at the late Agricultural Show, Dundee), was that presented by Mr. JAMES CAMPBELL, of the Dundee public seminaries. It consisted of magnificent plants of Oats and Barley, grown from seed which had undergone a certain chemical preparation, and without the aid of any manure whatever.

"Such a mode of culture is at variance with all practical experience; but Mr. CAMPBELL declares that his prepared seeds, which have produced these strong, healthy plants, were sown by him on land which, to his certain knowledge, had had no manure of any kind for eleven years; and he declared himself quite ready to verify his statement by experiment, and said he was willing, at any time, to impregnate with his chemical preparations the seed which any member of the Society should send to him for that purpose, so as to enable gentlemen to satisfy themselves fully as to the efficacy of this wonderful mode of culture."—*Journal of Agriculture, October*, 1843.

In this discovery is actually realised that boast of science, which some years ago prophetically asserted, that the time would soon come when one might carry in his pocket matter sufficient to manure an acre of land.

After impregnation with these liquids, the seed possesses within itself elements which not only afford additional nourishment to the grain during the progress of germination, but communicate to the expanding vessels of the plant an aptitude to absorb food, both from the soil and the atmosphere.

Of one specimen of Oats exhibited, the average produce of 33 seeds was 1600 grains from each, or a total of 52,800 grains, weighing 48 lbs. per bushel.

The produce of Barley was an average of upwards of 500 grains from each seed sown; and of Wheat sown on 5th July, and taken up on 8th August, to be exhibited, the result was, that while the unprepared seeds gave plants with two, three, and four stems only, the impregnated grain yielded plants with nine, ten, and eleven stems.

The material for these liquids, at the following prices, may be had of the following Agents.

Wheat . . .	material for one gallon	. .	2*s.* 6*d.*
Barley . . .	do.	do. . .	2 0
Oats and Grasses .	do.	do. . .	1 6
Beans and Peas .	do.	do. . .	2 0
Turnip and Rape-seed	do.	do. . .	2 6

Agents:—Messrs. GEORGE GIBBS & Co., Down-street, Piccadilly, London; JAMES HADEN, Ironmonger, Warminster, Wilts; JOHN CAMPBELL, 5, Mersey-street, Liverpool; E. R. CROUCH, Newcastle-on-Tyne; SAMUEL WALDIE, Carlisle; W. W. FYFE *Agriculturist* Office, Berwick; Messrs. P. LAWSON & SON, Edinburgh; DRYSDALE & Co., Glasgow; DRUMMOND & SON, Stirling; and DICKSON & TURNBULL, Perth.

One third, or even one-half less grain, is required for seed than is commonly used; and twelve gallons will impregnate eight bushels of grain; for the operation may be repeated in the residual liquid with additional measures of grain, as not more than one-tenth is absorbed in each operation.

Particular printed instructions for using the liquids will accompany invoices. No order under 20 gallons will be supplied.

1, Dudhope-street, Dundee.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had detailing the prices, &.

LIQUID MANURE.

PUMPS of a Superior Construction, fixed and portable, for Liquid Manure. Garden Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps for Ships, Barges, Tanners, Soap-boilers, Brewers, &c. Well Digging and Boring executed. BENJAMIN FOWLER (late George Turner), 63, Dorset-street, Fleet-street.

THE URATE of the LONDON MANURE COMPANY, 5*l.* per Ton. It is with the greatest satisfaction after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

NETTING, BUNTING, and SCRIMS, for EFFECTUALLY PRESERVING the BLOSSOM of FRUIT-TREES from FROST, in convenient quantities and at small cost, at BENJAMIN EDGINGTON'S Marquee and Rick Cloth Manufactory, No. 2, Duke-street, Southwark; and 208, Piccadilly, London.

"We understand from some of our friendly horticultural acquaintance, that wherever Bunting Screens have been employed, the wall-fruit has set in the finest manner, hence we again recommend this fabric in preference to any other."—*Bell's New Weekly Messenger.*

N.B. Some of the canvas used at the Smithfield Club Cattle Show to be sold as second hand, at moderate price, suitable for Rick Cloths, &c.

Just ready, price 1*s.*

PRACTICAL HINTS to Practical Men, on NEW and OLD MANURES, by JOHN DODDRIDGE HUMPHREYS, Esq., author of the Electro-Physiology of Man, &c., &c. Full information is here given as to the advantages of the New Manure called HUMPHREY'S FARMER'S COMPOUND, which is not subject like the Guano to be washed out of the soil, but unites the progressive action of the natural with the highest fertilizing powers of the best chemical agents. Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper Thames-street, London.

LONGMAN, BROWN, GREEN, and LONGMANS.

TO COLONISTS, AGRICULTURISTS, &c.—Mrs. MARY WEDLAKE, widow of the late Mr. THOMAS WEDLAKE, of the Original Iron-foundery and Agricultural Implement Manufactory, established forty years, at Hornchurch, near Romford, Essex, and of 118, Fenchurch-street, London, begs to inform the friends of her late Husband that she continues to Manufacture all kinds of Agricultural Implements, for the invention of which he was so often honoured with the medals of the Royal Society of Agriculture, and which obtained for him so high a distinction among the Farmers of England and British Colonists. Being assisted by men of talent in the Manufacture of these articles, she is in hopes of deserving the high repute this Establishment has so long enjoyed, and now solicits respectfully a continuance of the patronage of the numerous friends of her late husband. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, 118, Fenchurch-street, viz.—

Patent Hay-making Machines
Winnowing Machines
Dressing Machines
Patent Chaff-cutting Machines
Oil-cake Crushers
Double-action Turnip Cutters
Flour Mills
Bean Mills
Railway Wheels, Vacuum Pumps
Patent Essex Ploughs, 30 different sorts
Subsoil Ploughs
Horse-power and Hand-thrashing Machines
Patent Horse Rakes
Scarifiers
Drills of all kinds
Park Fencings, Hurdles
Furnace Bars
Cast Iron Horse Racks
Kitchen Ranges
Stoves, Fenders

*** Castings to any pattern.

☞ *For a more detailed List, see Johnson and Shaw's "Farmers' Almanack" for 1844.*

Please to be particular in the address, MARY WEDLAKE, 118, Fenchurch-street, London: or, Original Iron Foundry, Hornchurch, Essex.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL-ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

	£	*s.*	*d.*
Cottam's Patent Boiler, 18 inch . . .	2	15	0
Rogers' Boiler, small size	1	17	0

Larger in proportion.

Hot-water Pipe, at 2, 3, and 4 inches, at reduced prices.

GARDEN ROLLERS 18 inches long, 34*s.*; 20, 44*s.*; 22, 50*s.*; 24 inches, 60*s.*; 26, 75*s.*; 28, 84*s.*; 30, 105*s.* each.

CAST-IRON RICKSTANDS, 2 feet six inches high, 5*s.* 9*d.* each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

STRONG IRON HURDLES, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3*s.* 6*d.* each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs.,	4	0	,,
Strong do. do. do. 45 lbs.,	4	4	,,
Ox Hurdles, 4 feet high, do. 60 lbs.,	5	6	,,

BEST WIRE, for STRAINED WIRE FENCING, at 8*s.* per bundle of 150 yards each. Uprights for ditto, 7*d.* each. The Improved continued, and every other kind of Fencing, Fancy Wirework, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3*s.* 6*d.*; 20 inches, 4*s.* 6*d.*; 22 inches, 5*s.* 6*d.* each.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 7*s.*; 4 ft. 6, 9*s.*; 5 ft., 11*s.*; 6 ft., 15*s.*; 7 ft., 20*s.* per dozen.

SHOW-ROOMS at the Manufactory, No. 2, WINSLEY-STREET, where every information may be obtained.

The TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

In small 8vo, Second Edition, price 3*s.* 6*d.*

PRODUCTIVE FARMING; or, a FAMILIAR DIGEST of the Recent DISCOVERIES of LIEBIG, DAVY, and other celebrated writers on VEGETABLE CHEMISTRY; showing how the results of English Tillage might be greatly augmented. By JOSEPH A. SMITH.

In small 8vo, price 5*s.*,

A SUMMER AT PORT PHILLIP; including the latest information regarding that Colony. By the Hon. R. DUNDAS MURRAY.

W. TAIT, Edinburgh; SIMPKIN, MARSHALL, and Co., London

RELATION OF LANDLORD AND TENANT.

Just published, in one Volume, Royal Octavo, price two Guineas.

THE VALUE OF LANDED PROPERTY, demonstrated by practical Deductions and Illustrations, tending especially to facilitate the Valuation of Estates, as applicable to the purposes of Agriculture, in which is defined the Equitable Rent of the different descriptions of Land, and also the share of the Agricultural Products that constitutes the occupier's Profit. By LAYTON COOKE, Land Agent and Surveyor. Published by the Author, No 7, John-street, Adelphi, London.

AGRICULTURE.—A Gentleman occupying a Farm of 600 acres, of various descriptions of soil, pleasantly situated in the highly cultivated county of Norfolk, and within five miles distance of three of its market Towns, is desirous of taking one or two YOUNG MEN, to learn the practice of Agriculture. The parties would in all respects be treated as members of the family, and would have the opportunity of regularly attending Norwich market (decidedly the largest and most celebrated provincial stock market in England,) and also the advantage of becoming acquainted with the most approved specimens of Agricultural Implements and Machinery. References given and required. Address, J. D., Post Office, Norwich.

FLORIST TO HER MAJESTY THE QUEEN.

WILLIAM MILLER, Providence Nursery, Ramsgate, Kent, begs to thank his numerous Customers and Friends for the great Patronage conferred upon him last season, and at the same time to inform them that his List contains some of the greatest novelties ever offered to the Public, for which he solicits early orders, viz.:—FUCHSIAS, VERBENAS, PETUNIAS, &c., &c., for the Spring of 1844.

FUCHSIAS.

* FUCHSIA CONSTELLATION.—This large and desirable variety was raised in the Providence Nursery, and is one of the finest ever produced. For description of this extra brilliant variety see Dr. LINDLEY's opinion, which will be found in the *Gardeners' Chronicle* of September 9th, page 633, under the signature, W. MILLER. "Your hybrid, between fulgens and corymbiflora, is a very handsome flower, seed-pod small, tube long and slender, gradually increasing in size till the diameter is a quarter of an inch; the tube is a delicate pink colour, having sepals of a greenish primrose, forming a strong contrast to the bright and red corolla seen between them; the flower altogether is 3½ inches in length, and the buds are very handsome as they approach maturity; it flowers in a large broad bunch, which is divided into branches, containing altogether 150 flowers."

It was also submitted to the Editor of the "Floricultural Cabinet," whose opinion will be found in Number 128, under the signature, W. M. "Your Fuchsia is a very fine one, and deserves cultivation in every situation." To be Figured in Spring.

Also noticed in the *Northern Times*, as the "Gem of 1844."

Plants to be had at 12*s.* 6*d.* each, with the usual allowance to the Trade, when not less than six Plants are ordered at one time.

100 Extra Fine do., 105*s.*; the selection left to the purchaser.
[Except those marked thus*]

SPLENDID SEEDLING VERBENAS.

W. M. has two distinct and beautiful varieties to offer, feeling confident of their giving entire satisfaction. The one named "BLUE QUEEN," has been submitted to DR. LINDLEY, whose opinion will be found in the *Gardeners' Chronicle*, page 721, as follows:—"W. R., Your Sweet-scented Seedling, No. 105, is the best we have seen of its Colour—BRIGHT BLUE LILAC; the flower is large, smooth, and glossy, and perfectly free from crumple."—Plants in April, 5*s.* each, with the usual allowance to the Trade, when three or more are ordered at once.

The other, named "ZEUXES," is a beautiful rosy Vermilion, with large White Eye; this variety has also been submitted to Dr. LINDLEY, whose opinion will be found in the *Chronicle*, page 681.—"J. MILLER, your Seedling named 'Zeuxes' is large and very brilliant." Plants 3*s.* 6*d.* each, with the usual allowance to the Trade, when three or more are ordered at once. Figured, to appear in the *Florists' Journal*, for March.

BEAUTIFUL NEW PETUNIA "PUNCTATA."

W. M., in bringing this beautiful production into public notice, does so without the slightest diffidence, being fully assured of its giving the most entire satisfaction; it is of a dwarf habit, with dark green foliage. The reason it was not exhibited at the London Shows, was its not flowering till October. It has been three times submitted to DR. LINDLEY, whose opinion will be found at pages 721, 774, 777, as follows:—"M. R., your Seedling, No. 25, is quite a novelty; it is a beautiful, distinct, and desirable variety; the colour is a soft decided blue, mottled with white, and spotted with rose; these gradually disappear, and leave the flower of a beautiful blue, mottled with white; in this state the flower dies." Figured in Paxton's "Botanical Magazine," also in "Florist's Journal" for February. Plants in spring, 7*s.* 6*d.* each, with the usual allowance to the Trade when 3 or more are ordered at once. Orders will be executed in rotation.

Solicitors.—Messrs. Blanchard, Richardson, and Gutch, York.
Draining Engineer.—James Smith, Esq. (Deanston).
Secretary.—John H. Charnock, Esq., Wakefield.

This Association is formed for the purpose of affording to the Agricultural Interest, by means of its collective capital, the funds necessary for the *thorough Draining of Land:* and of executing and superintending the execution of the works required for this purpose on the most economical and effective principles; repayment of the money advanced to be made, with interest, by such equitable half-yearly instalments, as in the several cases may be determined.

Among the various objects to which of late years collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural Improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the Landed and Monied Interest, whilst to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.

The Principles upon which such an application of Capital may be securely based, have been already recognised by the Legislature in the Act of 3d and 4th Victoria, cap. 55, passed for the purpose of enabling the owners of settled estates to defray the expense of draining the same by way of mortgage, and to charge all or any part of the lands so drained, or other lands held therewith, with the payment, to any person or persons willing to advance the same, of the amount of the money which may have been expended, together with interest thereon, by equal yearly instalments of not less than twelve, nor more than eighteen; such instalments to be diminished or increased according to the greater or less improvement shown to have been made by such draining. Or the parties may charge the said lands with a Rent-charge for any such period as aforesaid. The Preamble of this Act expresses so clearly the objects of this Association, and at the same time shows the importance attached by the Legislature to the subject, that it is here extracted:—"Whereas much of the land in England and Ireland would be rendered permanently more productive by improved draining, and nevertheless, by reason of the great expense thereof, Proprietors having a limited interest in such land are often unable to execute such draining; and whereas it is expedient, as well for the more abundant production of food, for the increased employment of Farming Labourers, and the extended investment of Capital in the permanent improvement of the soil, that such Proprietors should be relieved from the disability, due regard being had to the interests of those entitled in remainder."

The object of the present undertaking is to avail itself of the provisions of this Act, so far as they apply, and by offering an ample and easily-accessible capital, to induce the parties contemplated therein to seek the benefit of its provisions; and, at the same time to afford to the Agricultural Interest generally, on equitable terms, and on the same principle as that on which the act proceeds, the requisite means for thoroughly draining their land.

The Capital to be 500,000*l.*, in stock of 25*l.*, with a deposit of 5 per cent. on its allotment; the amount and time of the calls to be regulated by the demand, as it arises, for the beneficial employment of the money, and so that no one call exceeds 20 per cent., with a notice of not less than two months for each payment.

The management to be under an effective Committee, elected by and from the Subscribers, with the most efficient Staff that can be selected for practical and scientific skill in their several departments.

The head office to be in York, with Agencies in other towns of the county and elsewhere, as the demand for the assistance of the Association may require, and as it may be found advantageous to extend the sphere of its action.

The Meetings of the Committee of Management to be held Monthly, or oftener if necessary, and of the General Subscribers, Annually, to receive the Report of the Committee, pass the Accounts, and transact other general business.

Interest after such a rate as the Committee of Management may see reason to recommend, to be allowed half-yearly on the Capital paid up, so soon as the returns on the money expended will permit; together with such further division of profits as, on a General Settlement to be made every four years, the affairs of the Undertaking will justify.

The Accounts to be balanced annually, prior to the General Meeting, and audited by competent parties duly elected.

The Association will, if thought necessary, apply for Letters Patent, and also for an Act of Incorporation, should it be subsequently found expedient to do so, in obtaining which it is probable no impediment will arise.

Viewing the prospects of the Farming Interest with reference to the effect which may result from the late or any future relaxation of the protective duties on Agricultural produce, and considering that the issue must, in some degree, be experimental, the position of the Agricultural Community seems emphatically to call for the most active promotion of every practical improvement, which, by securing an increase of production, may tend to counterbalance the depression consequent upon any relative reduction in prices. That the operation of this Association will greatly contribute to this end, can scarcely be questioned, one common interest inducing both Owners and Occupiers to avail themselves of the means thus offered; securing to the former the permanent improvement of their estates, and to the latter an immediate return considerably exceeding any charge which the cost of the works may for a time entail. Great advantage will be also secured in having the draining performed under the direction of the Association, which, in order to guarantee the most effective execution of the works, will in all cases avail itself of the first practical and scientific talent.

With reference to the security to be taken for advances made by the Association, it is of the utmost importance both to the undertaking, and also to those who seek its assistance, that they should be effected at the least possible expense which prudence will justify. There is little doubt but that an Act of Parliament will be passed in the ensuing Session, amending the present Drainage Act, and affording increased facilities to all parties interested in the subject, by means of which it is expected a very concise yet effective charge may be created at a moderate expense. In the meantime, the Association will, in the case of settled estates, deal entirely with the Landlord, and under the protection afforded by the present Drainage Act. In other cases the Association proposes to take a simple charge on the Estate or the Bond, or joint Promissory Note of the person draining with one or more sufficient sureties, and in all instances where practicable to have the Owner a party whose interest it will be to co-operate with his Tenant in placing the Association in a secure position. And in those districts where the system of *full valuation* prevails, safety will be doubly ensured, from the practice of valuing the residuary proportion of the cost to the on-coming party.

At a meeting of the Council of the YORKSHIRE AGRICULTURAL SOCIETY, held in York on the 20th of December, 1843, a resolution was passed approving generally of the objects of this Association; and at the monthly meeting of the Wakefield Farmers' Club, held on Jan 5, 1844, a resolution approving of the principle and objects of the Association was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool in July, 1841, Lord Stanley remarked that, "There was no bank in the whole country—no commercial speculation—no investment so safe, so pure and profitable, as that in which even borrowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship in a letter to the Committee says—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country if confined to its legitimate object—the lending of Capital on the security of an investment in draining; and I think it very probable that many Landed Proprietors would avail themselves of the facilities afforded by an Institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend."

Bearing in mind, then, the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return of the Capital embarked will be such as to insure the support of prudent and *permanent* Investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Applications for Prospectuses, &c., to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or, to J. H. CHARNOCK, Esq., the Secretary, Wakefield.

ACTUARY: Peter Hardy, Esq., F.R.S.

Extract from the Report of the Directors of the Society, to a General Meeting of the Members, holden the 17th January, 1844:

"At the end of the six years which have been completed since the 31st of December, 1837, there are in existence in the Society three times as many policies as there were in existence at the end of the year 1837. The capital sums assured under these policies are nearly doubled in amount. The corresponding income derived from annual premiums is also nearly doubled. The accumulated property of the Society is four times as great as it was at the end of that year, and the present divisible surplus is nearly six times as much as that declared in the division of the year 1837."

The Directors invite the public to compare the following Table of the Additions made to the Ten oldest existing Policies in the Society, up to the 31st of December, 1843, with the additions made by other Societies within the same time :—

1834, Policy No.	Sum Assured.	Premium.	Age at Admission.	Total Addition made in 1842.	Increase, 1843.	Total Addition made in 1843.	Amount of Premiums paid.	The total addition is equivalent to the following per centage on the amount of premiums paid.

PLAIN DIRECTIONS FOR MAKING WILLS in conformity with the Law, and particularly with reference to the Act 7 Will. 4 and 1 Vict., c. 26. To which is added a clear Exposition of the Law relating to the Distribution of Personal Estate in the case of Intestacy; with two Forms of Wills, and much useful information, &c. By J. C. HUDSON, of the Legacy Duty Office. 12th Edition, corrected, with Notes of Cases judicially decided under the above Act. Fcp. 8vo. 2*s.* 6*d.*

By the same Author, THE EXECUTOR'S GUIDE. Third Edition, fcp. 8vo. 5*s.*

*** These two Works may be had in 1 Volume, price 7*s.*

8.

THE DOMESTIC MANAGEMENT OF THE SICK ROOM, necessary in aid of Medical Treatment, for the Cure of Diseases. By ANTHONY TODD THOMSON, M.D., F.L.S., &c. Post 8vo., 10*s.* 6*d.*

9.

MEDICAL NOTES AND REFLECTIONS. By HENRY HOLLAND, M.D., F.R.S. &c. Physician Extraordinary to the Queen, and Physician in Ordinary to H.R.H. Prince Albert. 2d Edition, 8vo. 18*s.*

10.

HINTS TO MOTHERS FOR THE MANAGEMENT OF HEALTH DURING THE PERIOD OF PREGNANCY AND IN THE LYING-IN ROOM. By Dr. THOMAS BULL, Physician Accoucheur to the Finsbury Midwifery Institution. Third Edition, enlarged, fcp. 8vo. 7*s.*

11.

THE MATERNAL MANAGEMENT OF CHILDREN IN HEALTH AND DISEASE. By Dr. THOMAS BULL, Physician Accoucheur to the Finsbury Midwifery Institution. Fcp. 8vo. 7*s.*

12.

A DICTIONARY OF PRACTICAL MEDICINE. By JAMES COPLAND, M.D., F.R.S., &c. Vols. 1 and 2, 8vo., 3*l.*; and Part 9, 4*s.* 6*d.*

*** To be completed in three Volumes.

13.

A DICTIONARY OF SCIENCE, LITERATURE, AND ART; comprising the History, Description, and Scientific Principles of every Branch of Human Knowledge; with the Derivation and Definition of all the Terms in General Use. Edited by W. T. BRANDE, F.R.SS.L. & E.; assisted by JOSEPH CAUVIN, Esq., M.A. and Ph.D. of the University of Göttingen, and other gentlemen of eminence in their respective departments. 8vo., Woodcuts, 3*l.*

14.

A DICTIONARY OF ARTS, MANUFACTURES, AND MINES; containing a clear Exposition of their Principles and Practice. By ANDREW URE, M.D., F.R.S., M.G.S., M.A.S. Lond.; M. Acad. N.L. Philad.; S. Ph. Soc. N. Germ. Hanov.; Mulii. &c. &c. Third Edition, corrected, 8vo., 1240 Engravings on Wood, 50*s.*

15.

AN ENCYCLOPÆDIA OF GEOGRAPHY; comprising a complete Description of the Earth: exhibiting its Relation to the Heavenly Bodies, its Physical Structure, the Natural History of each Country, and the Industry, Commerce, Political Institutions, and Civil and Social State of all Nations. By HUGH MURRAY; F.R.S.E. New Edition, with Supplement, containing a variety of Important Information brought down to December, 1843. 8vo., 82 Maps, 1000 Woodcuts, 3*l.*

16.

A DICTIONARY, GEOGRAPHICAL, STATISTICAL, AND HISTORICAL, of the various Countries, Places, and Principal Natural Objects in the WORLD. By J. R. M'CULLOCH, Esq. 2 vols. 8vo., six large important Maps, 4*l.*

17.

AN ENCYCLOPÆDIA OF ARCHITECTURE; Historical, Theoretical, and Practical. By JOSEPH GWILT, Esq., F.R.A. 8vo., upwards of 1000 Woodcuts, from Designs by J. S. GWILT. 2*l.* 12*s.* 6*d.*

18.

AN ENCYCLOPÆDIA OF RURAL SPORTS; or, a complete Account, Historical, Practical, and Descriptive, of Hunting, Shooting, Fishing, Racing, and other Field Sports and Athletic Amusements of the present day. By DELABERE P. BLAINE, Esq. 8vo., nearly 600 Woodcuts, 2*l.* 10*s.*

LONDON: LONGMAN, BROWN, GREEN, & LONGMANS.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronized by "HER MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the Enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s.* 9*d.* per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

In 12mo, price 5*s.* cloth lettered,

GUIDE TO THE CONSERVATORY; being a concise Treatise on the Management of the Hothouse and Greenhouse; the Forcing of Bulbs, Shrubs, &c.; and the Best Mode of Keeping a Succession of Bloom through every month of the year; exemplified in a select list of the most admirable Plants of the present day, under the arrangements both of Jussieu and Linnæus, including their native country, propagation, and the soil adapted to each.

By RICHARD BAINBRIDGE,

Flower-Gardener to the Right Hon. Lord Wenlock.

From Notes of the Author's Daily Practice, and Communications furnished by liberal Eminent Floriculturists.

*** The peculiar characteristic of this Work is the means of obtaining a constant and large supply of flowers. It includes a very extensive List of Orchidaceæ, with their cultivation, as pursued by the most eminent practitioners.

London: ROBERT BALDWIN, 47, Paternoster-row.

On January the 8th, 1844, was published, handsomely printed in Demy 8vo., Part the First, Price 12*s.*,

SPECIES FILICUM; OR A SYNOPSIS OF ALL KNOWN FERNS. This first Part contains GLEICHENIACEÆ, POLYPODIACEÆ in part, and PLATES i. to XX. By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., F.R.S., &c., Vice President of the Linnean Society, and Director of the Royal Botanic Garden at Kew.

*** It is intended to publish Part the Second on the 1st March, 1844.

London: WILLIAM PAMPLIN, 45, Frith-street, Soho-square.

CURTIS'S BOTANICAL MAGAZINE.—Just published, price 3*s.* 6*d.* coloured, No. 206 of the NEW SERIES of this interesting and scientific work, edited by Sir William Jackson Hooker. It contains beautifully coloured figures of Cereus Extensus—Dinema Polybulbon—Ipomœa crassipes—Erica Shannoniana—Tetranema Mexicánum—Scaphyglottis violacea. The above work has been published monthly, without any intermission, for the last fifty-eight years, and stands unrivalled by any other botanical publication in beauty and extent. The whole or any part of the work from its commencement may be had of Mr. SAMUEL CURTIS, at the Botanical Magazine Warehouse, Glazenwood, near Braintree, Essex.

Just published, with 37 Illustrations, price 3*s.* 6*d.*, cloth,

MRS. LOUDON'S GLIMPSES OF NATURE, and Objects of Interest described, during a Visit to the Isle of Wight. Designed to assist and encourage Young Persons in forming habits of observation.

"We could not recommend a more valuable little volume; it is full of information, conveyed in the most agreeable manner. Our friend, Mr. Loudon, is the Mr. Merton of the story; this adds a melancholy interest to all parts of the work, enriched by his kindly and instructive conversation."—*Literary Gazette.*

"A more fitting present, or one more adapted to stimulate the faculties of 'little people,' could not be published."—*Bath and Cheltenham Gazette.*

London: GRANT and GRIFFITH, successors to JOHN HARRIS, corner of St. Paul's Church-yard.

BRITISH HUSBANDRY.

In two large Volumes 8vo., with numerous cuts of Farm Buildings, Instruments, &c., price 20*s.* 6*d.* in cloth.

BRITISH HUSBANDRY; exhibiting the FARMING PRACTICE in the various parts of the United Kingdom. Published under the superintendence of the Society for the Diffusion of Useful Knowledge, by BALDWIN and CRADOCK, 47, Paternoster-row.

Also a third Volume, sold separately, price 10*s.*, consisting of Reports of the Cultivation of various Select Farms; Outlines of Flemish Husbandry, Timber Planting, Road Making, and Cottage Economy.

MILTON'S BEE HIVES, &c.—A sheet of Illustrations, price 1*s.*, of the various Bee Hives, Feeding Machines, and other apparatus connected with the Apiary, being all the Plates of the "Practical Bee Keeper," a new work on Bees, published by J. W. PARKER, West Strand, and may be had of all Booksellers. The sheet of Illustrations will be sent post free on inclosing 1*s.* and a stamp—all letters pre-paid—to J. MILTON, 10, Great Marylebone-street, Wimpole-street.

CATTLE, SHEEP, THE HORSE.

In a large volume, 8vo, with numerous cuts of the various breeds beautifully delineated. Price 10*s.* 6*d.* in cloth,

CATTLE; Their BREEDS, MANAGEMENT, and DISEASES. By WILLIAM YOUATT.

Published under the Superintendence of the Society for the Diffusion of Useful Knowledge.

London: BALDWIN & CRADOCK, 47, Paternoster-row.

Also, by the same Author—1. SHEEP, their Breeds, Management, and Diseases; to which is added, the Mountain Shepherd's Manual, with numerous cuts, 10*s.* 6*d.* cloth. 2, THE HORSE, by the same Author, with a Treatise on Draught, by Mr. Brunel, with numerous cuts; price only 6*s.* 6*d.* cloth.

TO AGRICULTURISTS.—Price 3*d.*

A LETTER TO THE FARMERS OF BUCKINGHAMSHIRE.

By Sir HARRY VERNEY, Bart.

London: JAMES RIDGWAY, Piccadilly. Buckingham: CHANDLER and STALLWORTHY.

THE CLASSES FOR CHEMISTRY, STEAM NAVIGATION, and ENGINE DRIVING at the ROYAL POLYTECHNIC INSTITUTION, under Dr. John Ryan, and the Course on ELECTRICITY and GALVANISM, by Professor Bachhoffner, open on MONDAY, the 26th inst.

Terms and Syllabus of the Lectures may be had in the Office of the Secretary, 309, Regent-street.

News of the Week.

THE Irish State Trials have at length been brought to a conclusion, so far as the jury and their verdict are concerned. On Monday, the 12th, the Jury, after a sitting of

exactly four weeks, beginning on Monday, the 15th of January, returned a verdict of GUILTY against all the traversers generally, but excepting the Rev. Mr. Tierney on certain counts of the indictment, and modifying particular portions of their finding as applied to some of the traversers. On the delivery of the verdict the Court adjourned to the first day of Easter Term, Monday, the 15th April, when it will be in the power of the Crown to call for judgment. Before that time, however, it is said that the traversers will sue for a writ of error; or if this measure be abandoned, they will next term bring forward a motion for arrest of judgment on account of some alleged defects in the indictment. The conclusion of the trials having removed the objections to a public discussion of the Ministerial policy, the attention of both Houses of Parliament has been this week occupied by debates on the state of Ireland, and on the necessity of appointing a committee of the whole House to inquire into the causes of her grievances. The resolutions in the Lords were moved by the Marquis of Normanby, and discussed at great length during two sittings; but on Thursday night they were negatived by a majority of 97. In the Commons the resolutions were brought forward by Lord John Russell on Tuesday, and have formed the chief topic of discussion during the entire week. On Thursday night, during the speech of Mr. Ross in favour of the motion, Mr. O'Connell made his appearance in the House, having arrived from Dublin on purpose to be present at the debate. The other business in Parliament which calls for notice has been Sir J. Graham's exposition of his new Bill for the amendment of the Poor Law, and the vote of thanks passed by both Houses to Sir C. Napier and the officers and men engaged in the late operations in Scinde.

From Portugal we have the particulars of another of those revolutions which appear to take place periodically, as the precursors of a change of Ministry. The present movement, however, differs from some of its predecessors in being a military demonstration, the people at present having taken little part in it and shown little sympathy with its professed objects. The Government, nevertheless, appear to attach great importance to the insurrection; all the constitutional guarantees, answering to our Habeas Corpus, trial by jury and other rights of the subject, have been suspended, and the whole kingdom has been declared in a state of siege. Several leading members of the Opposition have been arrested, and an extensive defection of the troops is apprehended unless the vigorous measures of the Cabinet are successful in suppressing the efforts to corrupt them.—In Spain the insurrection still continues, with all the terrible accompaniments of a war of reprisals. The Government have not only suspended all law in the disturbed districts, but have issued orders to their commanders directing them to shoot all insurgents taken prisoners. This announcement has led to a system of retaliation in which still greater atrocities have been perpetrated. The insurgent leader, however, has received a check in the neighbourhood of Alicante, and the Government have succeeded in repressing the movement in some of the minor towns. Queen Christina left Paris on Thursday for Madrid, and is expected to reach that capital in the course of next week.

Home News.

COURT.—Her Majesty and Prince Albert have continued during the week in strict privacy at Windsor Castle, and will not see company it is said for the next three months. The whole of the Royal suite have been dispensed with excepting Mr. G. E. Anson, the Hon. C. A. Murray, and the two Equerries in Waiting on Her Majesty and the Prince, Lord C. Wellesley, and Colonel Wylde. It is expected that Her Majesty and the Prince will go to Claremont on the 27th or 28th of the month and remain there for three weeks, after which period the Court will leave for Buckingham Palace.

Parliamentary Movements.—Mr. Sutheron has been elected member for North Wilts in the room of the late Sir F. Burdett, and Mr. Nicholas Maher has been elected member for Tipperary, both without opposition.

Death of Lord Sidmouth.—On the 15th inst., Viscount Sidmouth, who was successively First Lord of the Treasury and Chancellor of the Exchequer, as Mr. Addington, and afterwards President of the Council, Lord Privy-Seal, and Secretary for the Home Department, died at his seat, White Lodge, Richmond Park, in the 87th year of his age. More than 12 years before his death, Lord Sidmouth resigned to the public a pension of 3000*l.* per annum. His Lordship is succeeded by his only son, William Leonard, the issue of his first marriage.

Death of Vice-Admiral Dickson.—We have to record the decease of another veteran flag-officer of the navy, Vice-Admiral of the White, Edward Stirling Dickson, which took place on the 28th of January.

The Colonies.—The Queen has been pleased to make the following appointments in the new colony of Hong Kong:—John Francis Davis, Esq., to be Governor and Commander in Chief; and John Walter Hulme, Esq., to be Chief Justice; the Hon. Frederick Wm. A. Bruce to be Secretary to the government; Brevet-Major Wm. Cain to be Police Magistrate, Sheriff, and Provost Marshal; R. Dundas Cay, Esq., Writer to the Signet, to be Registrar of the Supreme Court; Alexander Gordon, Esq., to be Surveyor-General; Lieut. William Pedder, R.N., to be Harbour Master; and Robert Montgomery Martin, Esq., to be Treasurer.

The Army.—It is officially announced in the Gazette that Lieut. Munro, who has been so long absent without leave in consequence of his late duel with Col. Fawcett, has been superseded in the Adjutancy of the Royal Horse Guards by the appointment of Lieut. Thos. Brunt.

New Sheriffs.—The Queen has been pleased to appoint J. Fowden Hindle, of Woodfold-park, Esq., to be Sheriff of the county palatine of Lancaster for the year ensuing.

Royal Academy.—On Saturday, the 10th inst., a general meeting of Academicians was held at the Royal Academy in Trafalgar-square, when John Prescott Knight, Esq., was elected an Academician, in the room of Henry Thomson, Esq., deceased.

Foreign.

FRANCE.—The news from Paris is less exciting this week than it has been since the opening of the Session, and the interest of the proceedings in the Chambers is chiefly of a domestic character. Rumours of a change of Ministry are current, and it is even stated that M. Guizot is likely to return to London as Ambassador; but little confidence can be placed in these conjectures at present. Much importance is always bestowed on the selection of the committee who annually examine and report upon the Budget. All the bureaux, save one, have just made their selections, and out of the sixteen members thus appointed, the Ministry have secured thirteen, whilst the Opposition have only three. Both the Chambers sat on Saturday, but in neither were the proceedings of interest to the English reader. In the Deputies, the discussion was resumed on a new Game Bill, which is encountering great resistance from the Opposition, and is the theme of many an angry article in the journals. On Monday the bureaux of the Deputies examined a proposition revived by the Opposition on the occasion of M. de Salvandy's resignation, for declaring certain offices and promotions incompatible with a seat in the Chamber. As the consent of, at least, three bureaux must be obtained before a proposition can be read in a public sitting, the members of all the parties hostile to the Cabinet were strenuously exhorted to attend that preliminary operation, and after a long debate the proposition was decided in favour of Ministers by a majority of about 20. On the same day the bureaux also discussed the authorized proposition made by M. de Bricqueville for conveying the mortal remains of General Bertrand to the Invalides. It was reported on the Bourse that Government had resolved to finish the Northern and the Strasburg Railroads, and perhaps that to Bordeaux from Tours; the others to be left to public competition.

SPAIN.—Accounts from Madrid of the 8th inst. announce that Carthagena had pronounced in favour of the insurgents of Alicante. The garrison, consisting of a battalion of the regiment of Girona and between 1000 and 1200 Catalonian prisoners, who had been transported thither for safe keeping by General Prim, had joined in the movement. At Valencia an attempt at insurrection was made after the departure of General Roncali, who was obliged to retrace his steps, and succeeded in checking it. Several of the leaders had been shot and the rest had fled into the mountains, where they formed themselves into a revolutionary junta. In the evening of the 29th an attempt at insurrection was made at Alcoy, which was suppressed by the firmness of the troops and National Guard. The revolters having fired upon the latter, a collision ensued, which was attended with some bloodshed and the capture of thirty of the assailants. As soon as this event was known at Madrid, a despatch was sent by the Minister of War to General Roncali, directing him in the name of the Queen to shoot the thirty insurgents taken prisoners at Alcoy. The Minister requests him to forward to his department an account of their execution for the information of her Majesty, and enjoins him not "to allow himself to be stopped by the fear of any acts of retaliation which the insurgents of Alicant might threaten, for although her Majesty should view with grief the victims that the fury of the rebels might sacrifice, yet the absolute necessity that the law and public vengeance should be a reality, weighed still more in her Royal mind." As might have been expected these violent measures have led to more appalling reprisals. A circular of the Minister of the Interior, addressed to the Political Chiefs of the 49 provinces into which the Chamber is divided, suspends all law pending the insurrection. At Alicante and at Murcia, Ruiz (chief of the insurgent column from Carthagena) shot in reprisal for the massacre of 20 prisoners by General Roncali "more than that number." Bonet, the chief of the insurrection at Alicante, shot the unfortunate bearer of the summons to surrender, sent him by Roncali, and declared "that for every man put to death by the officers of Government he would shoot ten of their partisans." On the 5th however a column of rebels from Alicante under the command of the chief of the insurrection, Bonet, was encountered near Eda by the Captain-General of Murcia and put to flight. Two hundred prisoners were taken, who abandoned their musketry and two pieces of artillery. At Elcho, Cocentayno, Orihuela, and Muro, similar movements had been repressed. The troops despatched from Madrid under General Cordova were reviewed and harangued by General Narvaez before their departure, but it was currently rumoured that they had given strong manifestations of dissatisfaction after they left Madrid. The soldiers who had served since 1839, and who had been previously promised their discharge, demanded that that promise should be fulfilled. They were answered by a threat that any one showing discontent should be immediately shot. The Colonel of one of the regiments was sent back to Madrid under arrest, and escorted by a party of cavalry. General Cordova arrived at Quintanar, in the evening of the 3d, and was to continue his march upon Murcia on the following day. The disarmament of the National Guards was proceeding without opposition throughout the country. This measure had been carried into effect at Logrono, Santander, Grenada, Soria, Guadalajara, Getafe, Alcala, and other localities adjoining Madrid. Some agitation prevailed at Seville, and the Papers of the 3d state that the troops of the garrison were consigned to their barracks, and that the military posts had been doubled in the city. Madrid has been strongly fortified, and has also been declared in a state of siege. Advices from Barcelona of the 6th state that symptoms of insubordination having manifested themselves in the ranks of a battalion of the garrison, the Captain-General, Baron de Meer, had adopted energetic measures to prevent a revolt. A sergeant who had expressed his opinion rather too freely with regard to the Government of Narvaez, had been arrested, tried, and shot. The city, however, was tranquil on the 6th.

PORTUGAL.—By accounts from Lisbon of the 7th, we learn that a serious insurrection has broken out there. The 4th regiment of Dragoons has revolted at Torres Novas, about 50 miles from Lisbon, and the cry that it has raised is, "The Queen and the Charter, but down with the Ministry!" All the leading Septembrists (with the exception of Viscount Sa da Bandeira, Count da Taipa, and one or two others) are compromised; a conspiracy to produce a general insurrection throughout the kingdom has been discovered; the Constitutional guarantees, answering to our Habeas Corpus, trial by jury, and other rights of the subject, have been suspended for 20 days; four of the most active amongst the Lisbon Septembrists have been arrested and imprisoned on board the Diana frigate, lying in the Tagus: three of the principal officers of the 3d Caçadores or Rifles have likewise been arrested and thrown into the military prison in the Castle of St. George; all the troops in Lisbon garrison have been constantly under arms for three days; the streets of Lisbon swarm with soldiery; the entire kingdom is declared in a state of siege; and the Cortes has been announced as sitting in permanence, the sitting of the 6th having commenced at noon, and not having terminated until near midnight. The insurrection so far is of an entirely military character; only a few civilians have taken part in it, and no proof has yet been received of the people having participated in it in any direction. The Lisbon people take no part in it, and it is reprobated generally by public opinion. The Chambers have concurred by large majorities in passing a law by which the constitutional guarantees are suspended throughout the kingdom, the most extensive discretionary powers are confided to the Government, and they are likewise empowered to raise by loan the sum of 2000 contos, or 450,000*l.* The publication of all the Lisbon journals is by order suspended, except the official *Diario*. The following persons have been arrested and are now confined on board the Diana frigate:—Lourenco d'Oliveira Grigo, formerly Civil Governor of Lisbon, Lionel Cavares Cabral, editor of the *Patriota*, Antonio da C. Souto Maior, late editor of the *Tribuno*, and J. L. da Silva, proprietor of a nail factory at Fundicao. Orders have likewise been issued for the arrest of Count Bomfim, Baron de Foscoa, Mendes Leite, Antonio R. Sampayo, J. A. do N. Moraes Mantas, and A. C. Xavier de Quadros. The three officers of the 2d Rifles imprisoned in the Castle were strong Septembrist partisans. The persons for whose arrest orders have been issued have thus far contrived to elude pursuit. Of all these, the most important and influential is Count Bomfim, who obtained permission a few days ago in the Chamber of Peers to proceed to Elvas, where he usually resides, and where he possesses considerable power. No doubt is entertained that his object is to make a revolt there; and as Elvas is a large garrison town, and Count Bomfim is rather celebrated as a military commander, it is dreaded that he may influence the garrison to pronounce against the Government, and thus create a most formidable nucleus of revolt. Incendiary proclamations have already been issued both by him and the two military Septembrist Deputies, Cesar de Vasconcellos and Jose Estevao, who are at the head of the insurgents of Torres Novas, in which they call themselves "The Peninsular Army," and appear anxious to secure assistance from the disaffected in Spain by reviving the old project of the "Iberian Republic," to comprise both Spain and Portugal in one commonwealth. The whole of the capital is under arms, which precaution it appears has extended to the Ministers of the Crown, for on the 6th the horse on which Senhor Costa Cabral was mounted taking fright, in the struggle to save himself a large double-barrelled pistol dropped from his pocket which was picked up and returned to him by a looker-on. Great consternation prevails in Lisbon, and the drums were beating to arms when the packet left the Tagus.

GERMANY.—The funeral of the late Duke of Saxe Coburg Gotha took place on the 3d inst. in the church attached to the Palace of Gotha, amidst salvos of artillery and the tolling of bells. The body lay in state the day before in one of the principal apartments of the Palace, and was visited by several thousands from all parts of the dukedom, all testifying deep regret. The procession was composed of all the officers of State and of the household of the deceased, a considerable number of officers from the Prussian garrison of Erfurt and Langenzalza, and the great bulk of the population. The troops of the duchy and civic guards lined the way at each side. After the service was chanted over the coffin, which was carried up to the altar by twelve gentlemen of the Court, the chaplain delivered a discourse reminding his hearers of the

many virtues of their departed Sovereign. The crowd then departed in silence.—Accounts from Berlin state that the recent illness of the Queen of Prussia has interrupted all the intended festivities at Court, and so dull a carnival season has not been remembered for many years. A few days since some thieves effected an entrance into the Mint during the night, and succeeded in getting hold of a thousand thalers, but were detected and recognised as old offenders. Much attention is occasioned by this event, as they are known to be connected with the workmen at present employed at the Mint. The Minister of the Interior has just forwarded orders to all the police authorities in the Prussian dominions to arrest the poet Herwegh, wherever he might be found in the Prussian territory. A poem which he recently published is the cause of this mandate.—Since the 1st of January a new style of church music has been introduced into the service of the Prussian churches. Chevalier Bunsen it appears recently published a little work, in which he pointed out that it would be far preferable to resume the ancient style of beautiful church music, in which the chorus of the congregation responded to the recitativos of the officiating clergyman, and which Luther never intended to abolish, although they have recently been done away with. The present church music is an approximation to his proposed plan, and occupies the greater portion of divine service, and consequently shortens the time allowed for the sermon. Another innovation is that the clergyman no longer pronounces the benediction from the pulpit, but descends to the altar for that purpose.

TURKEY.—Letters from Constantinople of the 7th inst. state that the site of the Palace of England at Pera being in many respects inconvenient, Sir Stratford Canning had asked to be allowed to choose a more agreeable position for the erection of a new Palace. The Sultan readily acceded to his request, and at his invitation Riza Pasha, Rifaat Pasha, and Mehemet Ali Pasha, repaired to the esplanade of Dolmabagtche to examine the grounds which appeared to them most suitable for the purpose. The Minister for Foreign Affairs immediately afterwards proceeded to the British Embassy, informed Sir S. Canning of the result of their observation, and requested him to select the site he considered most eligible. The public are still much occupied with the uncourteous dismissal of Sir Baldwin Walker from the Turkish service. Sir S. Canning considers this step or rather the way in which it was taken as an insult to his Government, who had sent Sir Baldwin Walker to Turkey at the special desire of the Porte. He has therefore demanded reparation, and there is no doubt that he will obtain it. A conference has taken place between the representatives of the five great Powers for the purpose of arranging some points respecting the affairs of Lebanon — such as the residence of the Druses and Maronites, and the losses suffered by the Maronites during the war in Syria. The Emir Bechir has constantly resided at Deruel Ekamar, but the Druses and Maronites each claimed this, the last residence of the Patriarch of Lebanon. The representatives have settled that Deruel Ekamar shall henceforth be the residence of a Turkish authority. At another meeting the ambassadors regulated the amount of the indemnity.—The last intelligence from Erzerum was dated Dec. 26. The conferences of the Turko-Persian commission still continued but had as yet been attended with no important result. Mr. Curzon was preparing to quit Erzerum to return to Constantinople.

WEST INDIES.—The mail steamer Avon, which has been overdue for some days, arrived at Southampton on Thursday morning. The delay had been caused by severe weather in the Gulf of Mexico, which lasted for two days. The voyage altogether had been unfortunate, and the Avon having steamed for 35 days, consumed all the coals, and the Captain was obliged to break away the bulk-heads and some other parts of the ship, for fuel. She left Mexico on the 4th and Bermuda on the 28th of January, and on the following day another gale came on, the wind blowing a hurricane, which continued for 48 hours. Sir Charles Adam was at Jamaica, on his way to Vera Cruz. The news she brings from the West Indies is not of much importance.

Parliament.

HOUSE OF LORDS.

Monday.—The Earl of RIPON moved the thanks of their Lordships' House to Sir Charles Napier, and the army employed in the conquest of Scinde, and in so doing traced the career of the gallant General from the early part of last year, when the operations commenced, through every successive stage, until their final close, carefully avoiding, in a case where unanimity was desirable, any topic which might provoke dissension.—Lord AUCKLAND seconded the motion; and the Duke of WELLINGTON declared, that after the fullest consideration of the events of the campaign, he had never known an instance in which a general officer had displayed in a higher degree than Sir C. Napier all the qualifications which were necessary for enabling him to conduct great operations. He praised in equally flattering terms his entire discretion and prudence in the formation of his plans, his activity in preparation, and his zeal, gallantry and science in action, and specified in particular the march upon Emaun Ghur as one of the most curious military feats of which either his experience or his reading had informed him. The resolution was unanimously agreed to.—Lord CLARENDON then, requesting information upon the present state of Spain, entered into a consideration of the general policy of both England and France with respect to that country, which was, he said, subsiding into a chronic civil war. He regretted the downfal of Espartero, and while discrediting the charges of active interference by France, censured the hostile feeling of that Government which had strengthened the hands of the Regent's enemies, and produced, by his ruin, an anarchy against which the Spanish throne could not stand. He thought the time ill-chosen for the "cordial understanding" which the King of France had described as subsisting between England and France on Spanish affairs, and would have preferred that they should have interposed in time to save all that was now lost. He wished to know what was to be the character of our future policy towards Spain, and whether the French Government had succeeded in procuring the exclusion of other candidates and the selection of Count Trapani, the brother of the King of Naples, as the intended husband of Queen Isabella?—Lord ABERDEEN exposed the absurdity of the opinion that the spirit of hostility to Espartero which in the course of six weeks had pervaded every village and every regiment in Spain was the creation of French intrigue, and attributed it rather to the jealous aversion the Spaniards had always displayed to foreign interference, excited by the prevalent, but erroneous, belief that the Regent was entirely under English influence. The "cordial understanding" between France and England had no especial reference to Spain: but arose from the belief that the general interests of the two countries were not antagonist but identical. Its object—and he knew of no other—was, as respected Spain, to maintain its complete independence, to check, as far as possible, every species of violence, and to extend its prosperity and happiness. The marriage of the Queen was exclusively a Spanish question, to be reserved entirely for the Spanish Government and nation. He was a party to no exclusion of any prince or family; and whatever might be his own wishes or those of others, Spain alone should decide upon a subject so entirely Spanish.—Lord CLARENDON professed his complete satisfaction at the answers he had received, and congratulated himself upon having elicited a declaration in which he so cordially agreed.

Tuesday.—The Marquis of NORMANBY, in a speech of two hours, brought forward a series of resolutions, pledging the House to examine into the causes of the prevalent discontent in Ireland. It would be impossible in our limits to give a complete abstract of a speech which fills nearly five columns of the *Times*, but it may be necessary to state that his Lordship accused the Government of having adopted the do-nothing policy when they should have stopped the sedition in its bud, and of having taken up the active policy when the sedition was about to expire of its own exhaustion. He charged them with having attempted the greatest of political faults—that of carrying on a government by means of a minority. He impeached them for having appointed a man to the Attorney-generalship who had once declared that he believed Roman Catholics had little or no regard for the sanctity of an oath. He blamed them for excluding from the members of the administration all persons, with the exception of the Duke of Wellington, who had lived out of the country the greater portion of his life, who had a local knowledge of Irish wants, feelings, and habits. He arraigned the conduct of the late trials, from the striking of the panel to the charge of the Judge, including in his censure the law-officers, the Chief Justice, and the Government.—Lord WHARNCLIFFE replied, and said it had never been the opinion of Government that the repeal meetings would wear themselves out, but they were obliged to endure the taunts of even their own friends in patience, until they obtained legal proof of the illegality of the whole series of meetings, which individually could not be called illegal. The repeal of the union was a question perfectly legal to discuss, and the difficulty was to convict those who concocted them of illegal and seditious designs. This had been done as soon as possible; and, whatever might be said to impugn the verdict that had been obtained, he was certain that universal England agreed in its justice. Of Mr. Smith he had never heard until he was appointed Attorney-general, and therefore knew nothing of his speech about the Roman Catholics and their oaths. He defended the appointments made by Government—explained the striking of the jury—vindicated the whole proceedings in the state trials, and maintained that Government had done everything that could be done to assert the supremacy of the laws, and to restore the country to tranquillity. But now that this was accomplished, he agreed with Lord Normanby that the time was come to look forward, and to see what was to be done. A commission had been already appointed to inquire how matters, manifestly unjust between landlord and tenant, could be remedied. It was proposed by Government to enlarge the county franchise, and, moreover, to relieve borough voters from the necessity of paying many of the rates to which they are now compellable before registering their votes. Then an additional grant for education was in contemplation, and measures for the better training of schoolmasters. Besides these, Government hoped to give facilities for the endowment of Roman Catholic glebes, chapels, and institutions. He objected strongly to any proposal which might endanger the stability of the established church in Ireland, treating as chimerical the notion of placing the two churches upon an equality; and concluded by explicitly declaring the determination of the Ministry to preserve the union inviolate, and uphold the supremacy of the law.—The Marquis of CLANRICARDE concurred in the charges Lord Normanby had urged against the Government—its exclusive reliance upon military force, its distrust of the Roman Catholics, the vacillating course it had pursued upon the repeal agitation, and the blunders that had marked the progress of the state trials—but approved generally the intended measures which Lord Wharncliffe had described.—The Earl of RODEN attributed the miserable circumstances in which Ireland was placed to the conduct of Lord Normanby when Lord Lieutenant, whose chief policy consisted in a wholesale discharge of the gaols.—The Earl of DEVON explained the intentions of the Landlord and Tenant Commission, and detailed the progress it had made in its inquiries.—The Marquis of WESTMEATH opposed the motion.—Lord HOWDEN, believing the resolutions proposed to be ill-timed, mischievous, and effective only in embarrassing the Government, could not give them his support.—Lord BEAUMONT, considering the present, when the Government stood on high ground, and that sedition was crushed, the proper time to undertake conciliatory measures, gave his support to the motion. He approved of the intentions of Government as far as they went, but hoped they would carry them a little further.—On the motion of Lord CAMPBELL, the debate was adjourned.

Thursday.—The adjourned debate on the state of Ireland was renewed by Earl FORTESCUE, who explained the way in which his appointments of stipendiary magistrates had been made, and expressed his wish to have the Protestant Church Establishment in Ireland reduced to an equality with the Roman Catholic.—The Earl of HADDINGTON replied, and said that the statements and propositions made by Government had been well received by their Lordships, and he believed they were considered to embrace the majority of the grievances which were dwelt upon with the greatest force in Parliament, and alluded to with the greatest virulence at the monster meetings which had of late taken place.—Lord MONTEAGLE disapproved of the mischievous agitation for the Repeal of the Union, and of the means employed to enforce it. It had been his fate to encounter Mr. O'Connell on that topic, and he would not shrink from it now. But though he had nothing to expect or fear from Mr. O'Connell; though he was denounced by him as the enemy of Ireland, and the denunciation had been circulated by the Repeal Association amongst his tenantry and friends, still he could not forget that Mr. O'Connell was venerated by millions of his fellow countrymen, and neither the means taken by the Government to suppress the monster meetings, nor the mode pursued to ensure a conviction at the trials, were calculated to give peace and contentment to Ireland.—The Earl of RIPON replied, recapitulating all the arguments already used in defence of the conduct of the Government towards Ireland, and in support of the measures proposed for the conciliation of the Irish people. At the conclusion of his speech it was discovered that the Lord Chancellor had retired from the Chamber, leaving Lord Shaftesbury on the woolsack. A dead pause ensued, during which it was stated that the Chancellor had left the House, not intending to speak.—Lord NORMANBY then rose to reply. In the midst of his speech the LORD CHANCELLOR entered the House, and being called upon for an explanation, said he had no desire to speak on the question, unless some of the legal authorities there questioned the legality of the proceedings of Government. As they had not done so, he did not feel called upon to address their Lordships. If he had done so, it should merely be to defend his character from the imputations cast upon it; but after the triumphant defence made of him by his noble friends, he was quite satisfied to rest silent.—A scene ensued between Lord BROUGHAM and Lord CAMPBELL, which kept the House in excitement for some time, Lord Brougham vehemently defending himself from the charge of having changed his principles.—At length Lord NORMANBY concluded his reply, and the House divided; when there were—Contents, 78: non-contents, 176; majority against Lord Normanby's resolution, 97.

HOUSE OF COMMONS.

Saturday.—Sir J. GRAHAM stated the alterations he intended to propose in his bill for the amendment of the Poor Law. As there was considerable difference of opinion on the abolition of the Gilbert Unions he would not now propose to abolish them, but would move on another day for a select committee to inquire into their operation. The bastardy law in its present shape had occasioned great dissatisfaction in Wales and in the north of England, and he had introduced into this bill a provision by which, on application being made within 40 days from the birth of the child, there should be power given to two magistrates to make an order of maintenance on the putative father, operating not only against his goods but against his person. This order would proceed upon the oath of the mother fortified by some corroborative evidence. It would be binding on the father till the child had reached the age of 13. He had selected the age of 13 because in the laws regulating the hours of labour in our factories that age was considered as the line of demarcation between the child and the young person. The child was then considered to be to a certain extent emancipated from parental control, and he therefore thought that 13 was the proper age at which the putative father should be emancipated from the charge of its support. He proposed that the *maximum* for maintenance should be fixed at 4*s.* a week. He proposed that the mode of remedy should be subject to an appeal to the quarter-sessions, and that the order then made should be binding not only upon the goods but also upon the person of the putative father. He proceeded in the next place to point out another important defect in the existing administration of the law. Recent experience in the large towns, but more especially in the metropolis, had proved that cruel hardship was often suffered by the destitute portion of the population while the question of their settlement was pending. In consequence of this evil the poor and indigent suffered greatly in being driven from police-office to police-office, from workhouse to workhouse, before they could obtain relief; and he believed that even in the midst of this inclement season numbers were forced in the metropolis to sleep in the parks and under the porticos of public buildings, and in other large towns to seek shelter under arches and gateways, exposed to want and misery, and suffering privation to an extent which was not consistent with the safety of human life. He thought that for such a state of things it was the duty of Government to provide an immediate remedy. With respect to the law of settlement as it affected the children in the workhouse schools he intended no alteration. He retained that portion of the old bill which provided a district school for the metropolitan parishes, and for other large towns; but he intended to add this regulation to it beside—he proposed to establish district asylums in the metropolitan parishes, and he intended that these asylums under certain regulations should be open for the reception for one night of every destitute or sick person. He proposed that in case of sickness the destitute person so received should be maintained at the common cost of the districts; that lodging and food for one night should be granted to all who applied for it, and that all should be at liberty to depart in the morning, subject to some task-work or other for four hours. This would be an important change; for parties were often refused admission into the workhouse until the question about their settlement was decided. He proposed that if the party relieved applied a second night, relief should be allowed on the same terms as before; but if he applied beyond a second night, the question of settlement would arise, and also the question whether he should not be proceeded against under the vagrancy laws.—Captain PECHELL signified his satisfaction at the course proposed with respect to the Gilbert Unions.—Mr. T. DUNCOMBE expressed himself to the same effect, not only on the subject of the Gilbert Unions but also on that of the bastardy enactments and that of asylums for the destitute.—Mr. BECKETT DENISON, Sir W. JAMES, and other gentlemen, intimated their gratification at the proposed improvements.—Sir J. GRAHAM gave explanations in answer to several questions, and after a few words on the subject of prison discipline, the bill was brought in and read a first time.

Monday.—The Factory Bill was read a second time, and the Metropolitan Improvements Bill was read a third time. On the motion that the Bill do pass, Mr. HUME moved that the words empowering the Governor and Company of the Bank of England to lend money for metropolitan improvements be struck out.—Mr. MASTERMAN supported this amendment.—Mr. C. WOOD suggested that the sum to be lent should be limited.—Sir R. PEEL acceded to this suggestion; but Mr. HUME pressed his amendment to a division, when there were—For the amendment, 70; against it, 145; majority 75. The Bill was finally passed with an amendment, limiting the sum to 250,000*l.*—Sir R. PEEL moved the thanks of the House to Sir C. Napier, and the Officers and men participating in the late Military operations in Scinde. The chief glory in that war where all were glorious was due to the Commander—one of three cousins who had ingrafted on the stem of an ancient family the distinction of personal nobility. Throughout the Peninsular war there were no Officers more prodigal of their blood than those cousins; and if we perused the records of one of the most recent and brilliant of naval achievements, which had changed the dynasty of the kingdom of Portugal and revived the glories of St. Vincent, we should find that its leader also bore the name of Napier. "Ready, aye ready," as it was the motto of that family, was also their character. The achievements of Sir C. Napier might seem desperate, and so they would have been if undertaken by ordinary persons; but when conducted by such a leader they were reconcilable with the calmest prudence. It was difficult to conjecture what result might have followed from a more backward and cautious generalship; his own conviction was, that the worst consequences would have ensued if Sir C. Napier had not advanced, and that he had no alternative but to confront the danger as he did. Sir R. Peel illustrated the value of Sir C. Napier's success by examples of the active and perfidious character of the Ameers, and by the operations of Sir J. Keane against those formidable chiefs. The military skill of Sir C. Napier was not his highest praise; still greater applause was due to the moral courage with which he had acted on his own judgment against urgent advice, and hazarded his own life and reputation. For such exploits he thought the House would be unanimous in their thanks.—Lord J. RUSSELL seconded the motion, applauding the moral courage with which Sir C. Napier had extricated himself from his difficulties, and congratulating the country on the more than youthful vigour which in advanced years that brave man still evinced.—Lord HOWICK assented to all the praises bestowed upon Sir C. Napier as a General, but he felt it a duty, as Sir C. Napier was not *merely* a General, to withhold any concurrence in the proposed vote of thanks. Every step politically taken against the deposed Princes was substantially determined by Sir C. Napier, through whose eyes alone Lord Ellenborough saw at the distance at which he was placed. He referred to the battle of Navarino as a precedent, and objected to the vote, because war had not been regularly declared against Scinde, and because the whole series of brilliant achievements had only occurred by accident. He would not, however, divide the House.—Mr. VERNON SMITH supported Lord Howick's views in which Mr. HAWES, Mr. MANGLES, and Mr. C. WOOD also concurred.—Sir H. HARDINGE and Sir H. DOUGLAS spoke in favour of the vote, and denounced the application of any technical objection to a vote of thanks for such splendid services.—Commodore NAPIER thanked Sir R. Peel for his complimentary allusion to his own exploits, and then gave a sketch of the "feats of arms" of his distinguished relative, of a considerable portion of which he had been a witness. At Corunna, in his first field, he was covered with wounds, and had fallen into the hands of Marshal Soult, who nursed him, and sent him home without exchange to his friends, and from that period up to his last extraordinary exploits in Scinde, he had evinced throughout unbroken energy, military courage and skill. He also approved as much of the policy he had pursued as of his "fighting propensities." Scinde was not like Europe or England; the climate would cut up an army in a few days; and nothing but promptitude saved his gallant relative from being surrounded by some sixty thousand

men, and his entire force cut off. Sir Charles Napier was blamed for differing with Major Outram in opinion: but political residents were actuated as much by ambition as generals; if the one thought of glory by the sword, the other was actuated by that of the pen; and Sir Charles Napier, in relying on his own judgment, followed the course which had testified its wisdom in its results.—Mr. S. CRAWFORD, not satisfied with Lord Howick's objection without a division, moved the previous question, which was seconded by Mr. BROTHERTON.—Lord PALMERSTON did not think that political considerations should enter into the consideration of the question. He saw only valour and skill in the achievement of brilliant exploits; and regretted that the House should depart from former precedent in not concurring in a unanimous vote. There was no analogy between the case of the battle of Navarino and the operations in Scinde; the one was an accidental movement on the part of a combined fleet, the other a real war, ending in dethronement. Reserving his opinion as to the policy of the war, he would concur in the vote of thanks. —Mr. O. STANLEY added a few observations; after which the House divided on the previous question, when the numbers were 164 to 9. This result was received with much cheering, and the vote of thanks then passed.—Mr. CHRISTIE moved for a select committee to consider the expediency of recognising the presence of strangers at debates, and the publication of debates under the pleasure of the House; and to consider and report what regulations may be necessary for that object.—Mr. DUNCOMBE seconded the motion.—The CHANCELLOR of the EXCHEQUER objected to it as unnecessary for any useful purpose, and not worth the risk of a change.—After a short discussion Mr. CHRISTIE struck out that part referring to the exclusion of strangers, and confined his motion to the recognition of reports. On this amended motion the House divided—for the motion 37; against it 84; majority 47.

Tuesday.—Lord JOHN RUSSELL brought forward his motion for a committee to take the state of Ireland into consideration. The present Government he said rather occupied Ireland by military force than governed her. A Government ought to rest upon opinion; but this Government stood only upon force. How was it that a kingdom handed over two years ago in perfect peace was now in a state of general disturbance? He could see in the now probable punishment of the man whom the Irish people affectionately regarded as their liberator, no hope of improved tranquillity. After tracing the history of Ireland from the Union, he said the Irish people would have taken a wiser course had they waited with calmness till their strength should have enabled them to obtain effectual relief from the English Government. But their leaders thought otherwise, and considered that no efficacious redress could be obtained but by a Repeal of the Union. Upwards of three millions of persons had now expressed a desire for that Repeal; and was it not an alarming symptom that so vast a number of persons should have come to such a conclusion? Ministers however took no decisive step against the Repeal meetings; they only dismissed some magistrates for not having taken notice of the newspaper reports of the Prime Minister's Anti-Repeal speech in Parliament. The meetings were allowed to go on from March to October; then suddenly on a Saturday evening a proclamation was issued to forbid a meeting which was to have taken place on the Sunday morning in the neighbourhood of Dublin. Great blame attached to the Government for their carelessness in thus incurring the hazard of riot and bloodshed; and the subject was one of those which demanded inquiry. He did not himself disapprove the prohibition of meetings dangerous from their numbers; and if a proclamation to that effect had been issued at the outset, he believed it would have been obeyed. In regard to the late trials he asked what advantage would the Government reap from the conviction they had gained? He doubted whether imprisonment and suffering would not rather increase than abate the popularity of Mr. O'Connell. What he should propose if the House went into committee, would be firstly to get rid of all sectarian policy; secondly, to give a fair and equal franchise, corporate as well as Parliamentary; next, to abolish the system of civil exclusion. Then, as to the question of the Ecclesiastical establishment. It had been urged as a main objection against the voluntary system, that the clergy maintained by it were too apt to make themselves and even their doctrine subservient to the prejudices of those who paid for that maintenance. Now this objection existed in Ireland with respect to the spiritual guides of 6,000,000 of people; and these guides were thus forced into politics and agitation. With this inherent evil of the voluntary system was united in Ireland that opposite evil also, which is more or less incident to every establishment —the jealousy and odium which it generates among the Dissenters from it. Thus your present state combined the disadvantages of both systems. His wish was to see the ecclesiastical endowments applied to the religious instruction of all classes. But this would not be feasible as yet; for in the existing state of feeling the priesthood would not accept a public provision; perhaps the utmost that could at present be done would be to make a liberal allotment for the education of the Irish clergy. The grant to their college, whether at Maynooth or elsewhere, should be the double of its present amount. The prohibition upon the Roman Catholic bishops against taking the titles of their sees should be abolished; and so should every other badge of degradation to the Roman Catholic clergy. But perhaps the most difficult of all these subjects was that of the disorders arising from the tenure of land. Mr. O'Connell had said that the solution of this difficulty is full of danger; but there seemed at all events to be no necessity for the collection of further evidence by a commission. He should wish to see an increase rather than a diminution in the number of the stipendiary magistrates; but he could not venture to say that he knew of any complete remedy for such an evil as that which was connected with the existing tenure.—Mr. WYSE in seconding the motion took a review of the Irish penal laws and of their operation. He complained that the Roman Catholics had not received their fair proportion of the favours of the present Ministry, and contended that they had been very contumeliously treated in being excluded from the Jury on the late trials in Dublin. He condemned the present policy of Government, especially on the subject of education, and assured them that the discontents and danger of Ireland would be rather aggravated than alleviated by the course now adopted.—Sir JAMES GRAHAM commenced by observing that it was on the fatal field of Irish policy that he had first parted from Lord John Russell, and expressed his fear that, judging from the noble Lord's sentiments just delivered, on the same fatal Irish field they never could meet again except as antagonists. The Right Hon. Baronet then proceeded to answer *seriatim* the accusations made by Lord J. Russell. As to the omission in the Recorder's office, that was an accident for which the Government were not responsible. With respect to the striking the Roman Catholics from the jury, he greatly regretted that a body whom he so much respected as the English Roman Catholics, should have treated this as an affront to their religion, when, in truth, the objections were only political. These Catholics were struck, not because they were Catholics, but, as to eight of them, because they were Repealers. Then, as to the two others, Michael Dunn and Hendrick, there were four Michael Dunns in the same ward, three of whom had signed a Repeal requisition; and it was, and still is, believed by Government that this man was one of those three; for, in an affidavit which he had now made, denying that he had subscribed to the fund, he did not deny that he had signed the requisition. The instruction given by Government was to strike only those Catholics who would have been equally struck had they been Protestants. The 10th of these Catholics was Hendrick, and he, when struck off, was supposed to be a Protestant, and was objected to for reasons which it would not be proper to disclose. The object of the Government had been not to get a single conviction, or to get convictions upon single speeches or paragraphs, but to get the whole case before the public, and to convict those who constituted the head and front of the offence; and this object had been attained, under the direction of a unanimous bench. The discrimination exercised by the jury had evinced that if the indictment had been merely for attending illegal meetings, there would have been no conviction; for the offence of which the traversers were found guilty was not that of attending at an illegal meeting, but that of holding a meeting, not in itself illegal, for an illegal purpose. It was idle to say that there was no conspiracy because there was no secrecy: in these days, Leaguers met in theatres, and Repealers in Conciliation-halls. He would remind the House that it was possible for Government to have tried the question by a common jury, in which case the traversers would not have been entitled to challenge a single man, while the Government, exercising its right, might have ordered the Jurors to stand by without stint or limit, but that they preferred giving the traversers the chance of a special verdict, and their right to challenge. One important benefit had already been derived from the conduct of the Government; because for the last three months there had been comparative peace in Ireland, an increase in the industry of that country, and an increase of employment for the labouring poor had been the result. He admitted that the hopes of the country would be sad if for the future there were to be no means of retaining Ireland but by military occupation, but he had discovered nothing very new in the suggestions made to-night for the future government of Ireland. All that had been proposed on the subject of tenure was comprised in the scope of the Commission already issued. The only measure which Lord J. Russell had recommended, as between landlord and tenant, was an increase in the number of stipendiary magistrates. On the subject of education it was intended to propose in the estimates an additional grant. With respect to the elective franchise he explained the way in which the number of electors in the Irish counties had diminished, and stated that the proposed increase of that number was intended by way of compensation for the decrease so occasioned. He then defended the judicial appointments of the present Ministry. It had been said that the liberal party in Ireland was the strongest in talent, and that from their ranks the new appointments ought to have been made, and yet of the counsel selected by Mr. O'Connell for himself and his associates every one except Mr. Sheil, Mr. M'Donough, and the Attorney and Solicitor-General of the late Government, were men of Conservative opinions. Then there was the great subject of religion, and the noble Lord would be satisfied with nothing but equality. It must be a postponed equality however, for the noble Lord admitted that the life-interests of the existing Protestant clergy were to be respected. How would you make provision for the Roman Catholic priesthood? The English people would not pay a tax for it, and if they would the priesthood would not take it. Would you overthrow the whole Church and resort to the voluntary system? That was not more acceptable to the noble Lord himself than to the Conservative party. Or would the noble Lord like an equal division between Protestants and Catholics? He himself could conceive nothing which would produce more angry feeling. But in truth he would consent to none of these inroads on the Protestant Church; the State had made its choice at the time of the Reformation, and that choice would not be believed be rescinded by the attacks of the conspirators at the Conciliation-hall. He concluded by calling on the House to negative the motion by a decisive majority. The debate was then adjourned.

Wednesday.—Mr. L. BRUGES took his seat for Devizes.—On the motion of Mr. PAKINGTON, the County Coroners Bill was read a first time.—Mr. J. S. WORTLEY moved the second reading of the Horse-Racing Actions for Penalties Discontinuance Bill, a temporary measure, to stop the *qui tam* actions founded on an obsolete statute, and commenced against a few gentlemen eminent on the turf. It will be recollected that this bill has passed the House of Peers; that it simply stops the proceedings already taken upon payment of the costs out of pocket; and that it suspends the operation of the old statute, so far as these penalties are concerned, for a time sufficient to admit of a revision of the Gaming Laws and the passing of a general act on the subject.—Mr. M. GIBSON moved as an amendment that a select committee be appointed to inquire into the existing statutes against gaming of every kind.—Lord J. MANNERS supported the original motion, and after a discussion, in which Capt. BERKELEY, Mr. M. MILNES, Mr. V. SMITH, Col. PEEL, Mr. HUME, the ATTORNEY-GENERAL, and Mr. C. BERKELEY, took part, the House divided, when there were for the second reading, 112; against it, 25; majority, 87. The bill was read a second time, after an intimation given by Sir J. GRAHAM that he was ready to support a committee to inquire into the whole state of the laws affecting gaming.—The adjourned debate on the condition of Ireland was resumed by Lord LEVESON, who deplored the policy which made religious differences the test of political distinctions; expressed his conviction that Ireland was not to be pacified by convictions and military rule; and was not without hope, as he had even during his brief career, seen so many changes in the conduct and opinions of public men, that he should yet witness Sir R. Peel devoting his abilities to the advocacy of a more liberal cause than he was now identified with.—Mr. B. COCHRANE and Mr. J. YOUNG followed in support of Government, and Lord CLEMENTS and Sir GEORGE GREY spoke in favour of Lord J. Russell's motion.—Lord ELIOT defended the conduct and policy pursued by Government throughout their entire Irish administration; and stated that the reason why, in their legal appointments, they had chosen gentlemen professing the Established, rather than the Roman Catholic religion, was, because there was not a single Roman Catholic member of the Irish bar entitled by his professional reputation to be promoted to the bench or to high legal offices. The debate was again adjourned.

Thursday.—Mr. Sotheron and Mr. Maher took their seats, the former for North Wiltshire, the latter for Tipperary.—On the motion of Mr. WYSE, an address to her Majesty, praying her to direct that the minutes in Council taken upon the subject of education in Great Britain be laid on the table, was agreed to.—The adjourned debate was opened by Mr. Ross, during whose speech Mr. O'Connell entered the House. Loud shouts from without announced his approach, and there was a rush of Members to their places. As he entered a burst of cheering broke out from the Opposition side of the House which was kept up for a long time, the Ministerial Members sitting in profound silence. Mr. BORTHWICK, Sir H. BARRON, and Mr. REPTON followed. Mr. MORE O'FERRALL said he drew from the speech of Sir J. Graham that he saw no alternative for the future but the government of Ireland by force. [Sir J. Graham dissented.] Well then he had declared the intention of the Government that the Established Church was still to be maintained in its present offensive form of inequality, and that was equivalent to a determination to govern Ireland by force. He passed a severe censure upon Lord Brougham; and with respect to the trials declared his conviction that the blundering of the Attorney-General, the striking of the Jury, and the charge of the Chief Justice deprived the verdict of all moral weight.—Sir J. GRAHAM disclaimed having said anything which would justify the allegation that the Government contemplated the future government of Ireland by force, though he had certainly said that the Established Church must be maintained in all its rights, privileges, and property.—Mr. SHAW entered into a minute technical detail of the mode in which the revision of the Jury-lists was carried on under the provisions of the statute. From his statements it appeared that instead of sixty or sixty-five names having been omitted there had been only nineteen omitted, and five which had been incorrectly placed, out of the five thousand names of common jurors from which the special-jury panel of between seven and eight hundred had to be selected. He had bestowed great care, labour, and anxiety on the revision of these lists; but the omitted names had accidentally been slipped amongst some blank sheets and the mistake had not been discovered in time. With much earnestness he assured the House that no corrupt motive had actuated either himself or the registrar of his court.—Lord HOWICK warned the House that the policy pursued in Ireland by the wide-spread disaffection which it caused, was a real and alarming danger which threatened us, should we ever be engaged in war. Nor were either the past conduct or the future promises of the Government calculated to inspire confidence; at a time when the whole population of Ireland was arrayed against us and was only to be kept down by physical force, the announced measures were but a "beggarly account of empty boxes." The proposed extension of the franchise might prove beneficial: but he feared that in the unsettled state of the relations of landlord and tenant, the commission would excite expectations which would be doomed to disappointment. No remedial measure was now likely to heal the wounds of Ireland, unaccompanied by a removal of that galling sense of injustice engendered by the partial treatment of the members of the ancient faith of the Roman Catholic Church. Even the Presbyterian clergy of Ireland, dissenters in the eye of the law, received a portion of the bounty of the State; whilst the Roman Catholics, the poorest population in Europe, were excluded from all participation in State endowment. The struggle might be protracted; but it could only end either in the triumph of popular right, or in that convulsion which some were mad enough to desire. In this awful conjunction of the fate of the British empire, it was their solemn duty to God and their country to weigh well the existing state of Ireland.—On Lord Howick sitting down (at half past eleven), no member rising, a cry arose of "Divide," but Captain BERNAL moved the adjournment of the debate. Strangers were ordered to withdraw; but on re-admission to the gallery, Sir R. PEEL was found addressing the house. He was understood to be replying to a taunt for remaining silent; but he assented to the adjournment.—Sir G. GREY thought it strange that Ministers, especially Sir Robert Peel, should maintain a determined silence. The debate might have closed that night, if he had risen and expressed his sentiments.—The debate was then adjourned.

CITY.

Money Market, Friday. — Consols closed at 97¼; Red. Three per Cents., 98⅜; Three-and-Half per Cents. Red., 103⅛; India Stock, 278; Bank Stock, 194; Exchequer Bills, 69*s.* to 70*s.* prem.

Metropolis and its Vicinity.

Anti Corn-Law League.—The fourth weekly meeting of the League was held on Thursday in Covent Garden Theatre, the Hon. C. P. Villiers in the chair. The meeting was addressed by Mr. Hume, M.P., Mr. Christie, M.P., and Mr. I. Fox, and the chairman announced that Mr. O'Connell would attend the next meeting.

London and County Bank.—The half-yearly meeting of the proprietors of this company was held last week in Lombard-street, Mr. Hawes, M.P., in the chair. The report stated that the business of the bank was progressively increasing, and that after deducting the current expenses of the head office and branches, the interest on current and deposit accounts, &c., there remained a balance of 3,871*l.* The directors recommended that a dividend of five per cent. be paid to the proprietors, leaving the sum of 805*l.* to be added to the guarantee fund. The balance-sheet showed liabilities and paid-up capital, 121,685*l.*; reserve fund, 8,245*l.* Due to customers on account of deposit accounts, &c., 996,082*l.*; rebate and loss, 29,152*l.*: assets in hand, 188,951*l.*; security discounted bills, 912,869*l.*: preliminary expenses, &c., 33,040*l.*; current expenses, interest on current and deposit accounts, 20,304*l.*; total, 1,155,164*l.* After the reading of the report, Mr. Isaacs, of Maidstone, addressed the meeting at considerable length, alleging that the bank had lost one-third of its paid-up capital; that it had incurred losses which had not been written off, and that its shares had fallen from 15*l.* to 7*l.* 10*s.* He concluded by proposing that a committee of inquiry be appointed to investigate its affairs. The Chairman replied to these statements, affirming that they were utterly unfounded and that they originated in the ill-will of a discarded officer. Ultimately, the amendment was negatived by a large majority and a vote of renewed confidence in the directors was unanimously passed.

College of Surgeons.—A meeting of Surgeons took place lately, "to consider and determine," according to the words of the notice, "what steps ought to be taken to resist the oppressive clauses of the recent Charter of the Royal College of Surgeons." Mr. Macilwain took the chair, and in explaining the objects of the meeting said that though there was some degree of difference in the feelings with which the Charter was regarded, it was viewed with great dissatisfaction by the majority of the profession—by nine-tenths of the profession at least. Dr. Lynch, Dr. Wilson, Mr. Carpue, Mr. Cooper, Mr. Dermott and other gentlemen addressed the meeting, and resolutions in favour of uniformity of education and equality of privileges, and condemning the exclusive character of the new Charter were unanimously adopted.

Liberation of Mr. Oastler.—On Monday Mr. Thornhill's claim of debt, principal, interest and costs, amounting to nearly 3,300*l.*, having been paid in full, Mr. Oastler was released from the Queen's Prison, after an imprisonment of three years and a quarter. Mr. Ferrand, M.P., Mr. Rashleigh, M.P., and several others of his friends were deputed to conduct Mr. Oastler to the central committee-room at the British Coffee-house, where he was received by the committee, over which Lord Feversham presided, supported by Mr. Colville, M.P., Mr. Walter, Mr. Scholefield, and other gentlemen. Mr. Oastler addressed the meeting at some length, and resolutions of thanks were passed to the chairman, committee, and others who had taken an active part in his liberation. On Thursday Mr. Oastler left town for Nottingham; this day (Saturday) he proposes to visit Leeds; and on Tuesday next he will make his public entry into Huddersfield, where great preparations are making for his reception.

The New Royal Exchange.—Instructions have been given by the committee superintending the erection of the New Exchange to sell the triangular block of buildings facing Cornhill and Threadneedle-street, known as Bank-buildings, which are to be taken down for the purpose of forming the western approach to the New Royal Exchange and the site for the Wellington statue. The portion to be sold comprises the premises occupied for many years by the

Sun Fire-office and the house where Messrs. Ladbrooke the bankers carried on business.

Trafalgar Square.—The Commissioners of Woods and Forests, in consequence of the extravagant terms demanded by the water companies for supplying the new fountains in Trafalgar-square, have resolved on sinking Artesian wells, which will give an ample supply not only for the fountains, but for all the public offices in the vicinity, together with the new Houses of Parliament, and for watering the roads when necessary. The commissioners have given orders to have the works carried into execution forthwith. The water is proposed to be raised by steam power into large iron reservoirs fixed over the engine-house, which will be sufficiently elevated to give the necessary pressure, so as to produce the effect desired by Mr. Barry in his design for the square. The site selected for the works is the stone yard behind the National Gallery.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Feb. 3. —West Districts, 134; Northern, 189; Central, 194; Eastern, 246; Southern, 323. Total, 1086. Weekly average for the last five years, 946.

Provincial News.

Agricultural Meetings.—Since our last report, meetings in favour of agricultural protection, and for the purpose of forming associations to resist the League, have been held in the following places:—On Monday week, at Abingdon, Mr. Harris the Mayor in the chair, supported by Mr. Duffield, M.P., and other landowners.—On Tuesday at Berwick, the Earl of Lauderdale in the chair, supported by Mr. Hay of Dunn Castle, Sir J. Pringle, Bart., and Mr. Spottiswoode of Spottiswoode.—On Saturday at Bedford, Mr. Pain a tenant-farmer in the chair, supported by Lord Alford, M.P., Mr. Stuart, M.P., Mr. Astell, M.P., Sir C. G. Payne, Bart., F. Pym, Esq., R. L. Arlebar, Esq., &c.—On Saturday at Croydon, J. W. Sutherland, Esq., in the chair, supported by Mr. Antrobus, M.P., Sir W. Jolliffe, Sir H. Bridges, Mr. J. W. Freshfield, Mr. A. Barclay, &c.—On Saturday at Gloucester, Mr. Niblett in the chair, supported by the Hon. F. Charteris, M.P., Sir M. H. Beach, Bart., and other Agriculturists.—On Tuesday, the 6th, at Penrith, Sir George Musgrave, Bart., of Eden Hall, in the chair, supported by R. Hodgson, Esq., the High Sheriff of the county; E. W. Hasell, Esq., Dalemain; A. T. Huddleston, Esq.; R. R. Saunders, Esq., Nenwick] Hall; and about 400 farmers:—On Saturday at Kingston, Mr. D. Maydwell, a tenant-farmer, in the chair, supported by Mr. Trotter, M.P., Mr. Kemble, M.P., Sir D. Scott, Sir H. Fletcher, Mr. Row, &c., &c.—On Tuesday at Wokingham, J. St. John, Esq., in the chair, supported by the principal landowners of the district and about 400 of the tenant-farmers of Berkshire.—On Wednesday at Wolverhampton, Dr. Mannix in the chair, supported by the Earl of Dartmouth, and most of the landowners, farmers, &c. in the neighbourhood.—On Wednesday at Shrewsbury, the High Sheriff in the chair, supported by Earl Powis, the Hon. R. H. Clive, M.P., Viscount Clive, Lord Hill, Lord Newport, Lord Berwick, Sir J. R. Kynaston, Sir B. Leighton, &c.

Alnwick.—The local papers state that the anticipated spoliation of Chillingham Park announced in our Paper of the 3d inst. has fortunately not taken place. The wild cattle have been successfully claimed by Lord Ossulston as heir-looms of the estate, and consequently unalienable property of the Earls of Tankerville. The deer only were therefore offered for sale, and on Thursday last were put up at the following prices:—The rein-deer in one lot at 80*l.*, and the fallow-deer at 50*l.* There was not however a single offer made, and the sale did not proceed.

Birmingham.—A local paper states that it is the intention of Ministers to bring in a bill before Easter for establishing Central Criminal Courts in several large towns on the same plan as the Metropolitan Criminal Court. It is said that Birmingham is to be included in the list, and that prisoners from all places within 10 miles of the borough will be tried at this court. A court-house and prison are to be built, half the expense of the erection to be paid by Government. An assize for the trial of prisoners will be held every six weeks at which one of the judges will preside. Should Parliament sanction this measure it is understood that the judges of Westminster-hall will be increased in number to 20.

Brighton.—Colonel Wyndham, M.P. for Sussex, has sent a letter to the Secretary of the Royal Agricultural Society desiring that his name may be erased from the list of members of the Society, in consequence of the recent declaration of Lord Spencer, President of that Society, on the subject of the Corn-law.

Bristol.—Her Majesty has been pleased to contribute the sum of 20*l.* to the fund for the relief of the family of the late Mr. Prichard, who recently committed self-destruction under circumstances of a distressing character. It appears that in 1830, Miss Prichard, the eldest daughter, then three years of age, was admitted by Sir J. Conroy into the presence of her Majesty at Clifton. She was much noticed by her Majesty, who presented her with a beautiful flower. This flower was carefully preserved, and a few days since a communication was made to Mr. Anson respecting the distress of her family, and the flower so preserved was also transmitted with a statement of the facts; in reply, her Majesty directed Sir H. Wheatley to transmit to Miss Prichard a cheque for 20*l.* as a donation towards their relief.

Cambridge—The Restoration Committee of the Round Church, one of the most beautiful antique structures of the kind in the kingdom, has just received a subscription from her Majesty of 25*l.* through the Keeper of the Privy Purse. In his letter to the Committee, Sir H. Wheatley stated that he had been commanded by her Majesty to forward this sum as a mark of the satisfaction with which the Queen had witnessed the beauty of the sacred edifice when her Majesty visited Cambridge. The Committee are still in debt between 1000*l.* and 2000*l.*

Cheltenham.—On Friday an inquest was held in this town on the body of a child which had been received, packed in a hamper, by the Rev. F. Close, and had caused great excitement throughout the town; forming the leading topic of conversation at the assembly-rooms, libraries, the spas, and news-rooms. Mr. Hillyer, clerk to the railway station at Cheltenham, proved that the basket was received on the night of the 7th inst., which he forwarded in the omnibus to the Royal Hotel. The basket was addressed to the "Rev. Mr. Close, Bays-hill, Cheltenham, Gloucestershire." The sum of 1*s.* 11*d.* had been paid on it at Birmingham. It had been delivered to the Rev. gentleman in the usual way, but when the contents had become known it was sent back to the station. The coroner said the magistrates had complained to him relative to this occurrence, but the magistrates ought to have been apprised of the affair before the hamper had been removed, as many unpleasant reports had gone abroad. Although they might have no foundation, still it was very painful. Mr. Russell, superintendant of police, had been sent for, and opened the box by order of the magistrates. He found an exceedingly handsome child's coffin, which contained the dead body of a remarkably fine new-born male infant. He had instituted every inquiry, and found that the hamper originally came from London. The investigation was still proceeding in order to discover the guilty parties. Mr. Hawkins, surgeon, had made a *post mortem* examination of the infant by order of the coroner. The body was carefully and neatly dressed with good baby-linen, but the mother had not proper medical assistance at the birth. There was no food in its stomach, but witness would not undertake to say what was the immediate cause of death. The coroner said it was proper that the circumstance should have the fullest investigation, he would therefore adjourn the inquest to afford the police time to pursue their inquiries. The occurrence has excited a great sensation in Cheltenham, being the universal topic of conversation.

Nottingham.—Her Majesty's Government has issued a free pardon to Valentine Marshall, one of the rioters who was transported for life by Mr. Justice Gazelee at the special reform riot commission at Nottingham in 1831 for setting fire to Colwick Hall, the seat of John Musters, Esq., in this county, and from the effects of which Mrs. Musters, the famous "Mary" of Lord Byron, met with her death in the shrubbery. This announcement appeared in the *Hobart Town Courier* of Sept. 8, and by a private letter received from Marshall he states that he shall be in Nottingham in a very short time.—It will be remembered that on New Year's-eve six burglars, sentenced to transportation, broke out of Nottingham gaol, after a furious assault upon the turnkeys, one of whom was so severely beaten that his life for a time was despaired of. One of them, Burton, was apprehended the same night; and another, Binns, was taken about a week afterwards. On Thursday week a third, named William Thompson, was arrested in the house of a labourer at New Sneinton, where he had been concealed some days. A brace of loaded pistols and a number of skeleton keys were found on his person. The hiding-places of the three other prisoners who are still at large are known to the police, and hopes are entertained of their speedy apprehension.

Oxford.—The public meeting which took place on the 2nd ult. relative to a plan for a general cemetery for Oxford, and which was fully noticed in this Paper, has led to additional efforts on the part of the Church and the Dissenters. The corporation have since met and resolved to establish a general cemetery in opposition to the wishes of the parochial clergy, who however supported by the bishop of the diocese have taken further steps. A meeting was convened by the archdeacon at his rooms in Christchurch on Tuesday the 16th ult. for the purpose of considering the propriety of providing additional burial-ground for the several parishes. It was attended by many of the heads of colleges, several influential gentry and tradesmen of the city, besides the parochial clergy. It was resolved "that the crowded state of some of the churchyards in Oxford renders it desirable to provide additional burial ground or grounds, to be placed on the same footing as the present churchyards:—that a committee be formed for the purpose of considering the best means of giving effect to the principle embodied in the foregoing resolution, and that they report on the same to an adjourned meeting to be convened by the archdeacon." At a meeting of the committee held on Friday week at the Archdeacon's rooms, Christ Church, the report of the sub-committee was delivered in and adopted, recommending—1. The purchase of three burial grounds on different sides of Oxford for the use respectively of the parishes nearest them; considering the many evils which might result from funeral trains being made to pass out by one road, the injury to property lying on the sides of that road, the great inconvenience likely to arise on occasional days of busy traffic, the interruption to vehicles passing, and the unseemliness of all that would take place amid such scenes, not to mention the great advantage and comfort to the attendants on the funeral procession—the aged and infirm, for example—of not being compelled to extend their walk through the length of the city under such circumstances. 2. That such burial-grounds should be purchased by subscription. 3. That these burial-grounds should be a provision for all persons, being placed precisely on the same footing as the existing churchyards." Dr. Routh President of Magdalen, Rev. Vaughan Thomas, Rev. R. Gresswell and Mr. J. Parker have each given 100*l.*, and Dr. Ingram the President of Trinity 50*l.* towards the establishment of the cemeteries.—The Chancellor of the University as visitor of Pembroke College has given his opinion that the election of Dr. Jeune, the Dean of Jersey, was informal, in consequence of some of the votes tendered for the Dean being given by Fellows on the more recent foundations, and as such not entitled to vote at the election.

Sunderland.—The merchants of the Coal Exchange are getting up a petition to Parliament against the projected duty of five per cent. which Government intends imposing upon all sea-borne coal that enters the port of London, for the purpose of enabling them to carry out the proposed Metropolitan improvements. A memorial has also been forwarded to Sir R. Peel from a numerous meeting of coal-owners of Northumberland and Durham.

Uxbridge.—A fire, which has resulted in the destruction of Hillingdon-house, the country seat of R. H. Cox, Esq., of the firm of Greenwood, Cox, and Co., of Craig's-court, and one of the magistrates for the western division of Middlesex, broke out on Sunday morning while the family were preparing to attend divine service. The fire was first seen by the servants upon the premises, who, observing the smoke, discovered, after some search, that flames were issuing from the north-east end of the roof, whence they extended with great rapidity to the opposite side, destroying in their progress the massive wood-work and descending to the stories below. Three engines soon arrived, but they were barely sufficient to furnish the hose of one, from the distance the water had to be conveyed. It was soon found that nothing could save the house, and the efforts of those present were concentrated upon the destruction of all connection with the valuable offices. This, fortunately, was effected. In the meantime great part of the pictures, plate glass, and plate, with the most rare part of the furniture, &c. was placed out of danger. The drawing-room which is now a scene of desolation was fitted up magnificently about three weeks since, on the occasion of the visit of her Majesty, who lunched with the family on her way to Pole-hill. Altogether the damage is estimated at upwards of 15,000*l.*, which will principally fall upon the Sun Fire-office. The fire is supposed to have originated through a flue at the back of the staircase communicating with the roof.

Whitby.—An inquest has been held upon the body of John Moffat, gamekeeper to the Marquess of Normanby, who was shot in the night of the 29th ult. by a poacher named Lowther, and subsequently died of his wounds. A verdict of "Wilful Murder" against Lowther and a man named Pearson, his companion, was returned and they have been committed to York Castle for trial. Moffat had lived with the Marquess of Normanby at Mulgrave Castle for the last 15 years, and was just about to be married. His body was interred in Lyme churchyard on Saturday, and the funeral was attended by the Earl of Mulgrave, Mr. Turton, and a large concourse of people. The murderer has been thrice convicted of poaching, and was the first person suspected of having committed the murder of Mrs. Robinson, at Eskdale-side, for the discovery of which a reward of 200*l.* was offered, but nothing appeared in evidence against him, and he was discharged.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1246*l.*; Birmingham and Gloucester, 1717*l.*; Eastern Counties, 3517*l.*; Edinburgh and Glasgow, 1742*l.*; Great Western, 11,801*l.*; Grand Junction, 6888*l.*; Glasgow, Paisley, and Ayr, 1187*l.*; Great North of England, 1309*l.*; London and Birmingham, 14,585*l.*; South Western, 4654*l.*; Blackwall, 536*l.*; Greenwich, 578*l.*; Brighton, 2788*l.*; Croydon, 188*l.*; Liverpool and Manchester, 3965*l.*; Manchester, Leeds, and Hull, associated, 5405*l.*; Midland Counties, 2404*l.*; North Midland, 4075*l.*; Newcastle and Carlisle, 1083*l.*; South-Eastern and Dover, 2281*l.*; Sheffield and Manchester, 447*l.*; York and North Midland, 1371*l.*—The Brighton Company held their meeting last week. A dividend of 1*l.* per share less the income-tax was unanimously accepted, and resolutions were passed authorising the directors to take steps to conclude contracts for leasing the Hastings and Lewes branch at a rate of 4 per cent. upon the cost of construction, not exceeding 475,000*l.*, and the Shoreham and Chichester branch at a rate of 4 per cent. upon cost of construction, not exceeding 300,000*l.* Another important resolution was passed giving the directors power to enter into negotiations with the South Eastern Company for a final settlement of the large outstanding claim of 360,000*l.* on fair and reasonable terms. Unless such power was delegated, it was stated that no hope of arrangement could be expected for the present generation of shareholders. The report states the traffic of the line to have increased during the half-year 9,885*l.*, while the expenses have been reduced 7,500*l.*, making a gross increase in net revenue of 17,300*l.* Further economy is contemplated, which it is said can be exercised without impairing the efficiency of the staff or decreasing the safety of the public. The Brighton Company has at last joined the South-Eastern and Croydon Companies in an amalgamation of working expenses, which arrangements come into operation from the 1st March. After paying this dividend, which absorbs 35,156*l.*, a surplus of 2,510*l.* is left to the credit of the current half-year.—The Birmingham Company held their meeting last week, the dividend declared was at the rate of 10 per cent. per annum paid out of clear profit, leaving a considerable surplus undivided for the benefit of the current half-year. The directors announced their determination to carry on the management of the undertaking on a sound footing, and rigidly adhere to the principle [illegible]

dividend which can on future occasions be satisfactorily supported. It was distinctly stated at the meeting that they sanction and encourage the projected line to Holyhead, as also that connecting Lancaster with Carlisle. The net profits for the year 1843 were 502,484*l.*, and the dividend at the last meeting 242,732*l.*, leaving the disposable balance of 259,751*l.* for the present dividend.—The Chester and Birkenhead Company at their recent meeting announced a dividend of 8*s.* 6*d.* per share on the 50*l.* share, and 4*s.* 3*d.* on the 25*l.* share, and this concern is now to be amalgamated with the new project of the Holyhead Railway. The terms on which the amalgamation takes place are purchasing the stock of the Chester and Birkenhead Company at par, and allowing the shareholders either to take new shares in exchange or receive immediate payment.—The Northern and Eastern Company held their meeting last week. The report showed that the line continues to improve, and the dividend the net profits return is 5 per cent., which was the amount declared, although the directors in their report only recommended 4¼ per cent. When the line is fully developed the directors say that there can be no doubt of the shareholders receiving a dividend considerably in excess of the 5 per cent. guaranteed by the Eastern Counties Company, according to the agreement made between the two companies.—The North Midland Company have declared a dividend of 2*l.* on every whole share, of 1*l.* on every half share, and 13*s.* 4*d.* on every third share, clear of income tax, and then 4,950*l.* 3*s.* 4*d.* is left to be carried to the next half-year's account. The net profits of the past six months were 64,722*l.*, showing an increase in revenue of 6,463*l.*, and a decrease in expenditure of 6,230*l.*—The York and North Midland pays a dividend of 2*l.* 10*s.* on each whole share, and 1*l.* 3*s.* on each half-share, clear of income tax. The total receipts of the half-year have been 47,594*l.* and the expenditure 23,218*l.*, leaving about 24,400*l.* for division among the shareholders.—At a special meeting of the South Eastern and Dover Company on Saturday, resolutions were unanimously passed authorising the directors to apply to Parliament for an Act for the improvement of Folkestone Harbour, and to take steps to enable them to carry a line from Ashford to Canterbury, Ramsgate, and Margate, and also empowering the directors to lease the intended Tenterden, Rye, and Hastings Railway at 4*l.* per cent. per annum, provided its cost does not exceed 400,000*l.* During the discussion several resolutions were read, passed at public meetings at Margate, Ramsgate, and Broadstairs, highly approving of the proposed line.—The Jury at the recent inquest on the men killed on the Eastern Counties Line have returned a verdict of "Manslaughter against some person or persons unknown."—On Saturday, as Sir William Follett, with Messrs. Crowder, Alexander, and Wordsworth, were returning from Maidstone, where they had been attending some railway compensation cases by a special train, on its arrival at New Cross on the Greenwich Railway there were three men employed with trucks on the railway. The train not being expected, the men had scarcely time to save themselves, leaving the trucks across the rails; the engineer had not time to stop the engine, a collision took place, and the shock was violent; but the Solicitor-General and his colleagues escaped without injury.

IRELAND.

THE STATE PROSECUTIONS.—*Twenty-second Day.*—On Friday morning the Solicitor-General resumed his address to the Jury, which it will be recollected he commenced on the morning of Wednesday, and occupied the entire of that day and Thursday in continuing. He commenced with the history of the Mullaghmast meeting, and analysed the whole of its details, including the speeches before and after dinner—the inflammatory handbill sold among the people—the military costume of the musicians—and parading of the people, &c. He next adverted to the preparations for the meditated Clontarf meeting—the famous Repeal cavalry advertisement—and other circumstances connected with that last of the monster meetings. He referred to the history of the battle of Clontarf, as given in the *Pilot* newspaper, and finally observed upon the effect of the proclamation in arresting the course of Mr. O'Connell's proceedings. The learned Gentleman having gone through all the evidence given for the Crown, submitted to the Jury that they had fully made out the case. As to the evidence given for the defence, he asked could anything be imagined more weak—more insufficient—more nugatory? It was only valuable as a negative, pregnant with confirmation of every charge in the indictment. It was remarkable that no petitions to Parliament had ever issued from one of these monster meetings, and even the pretext of preparing such petitions was scarcely resorted to. He made a few observations on the evil consequences which had resulted to the country from this long-continued agitation, exposed the total want of analogy between the circumstances of Ireland now and those which existed in 1782—the period so constantly referred to by Mr. O'Connell, and wound up with a brief appeal to the Jury. He concluded at half-past twelve when the Judges retired. At one o'clock the Court resumed, and the Chief Justice proceeded to charge the Jury.

THE CHARGE.—The Chief Justice commenced by saying that it now fell to him to make such observations as occurred to him upon the manifold circumstances of this very important case, and he was happy to say that in conference with all his Learned Brethren of the bench, there was a concurrence existing between them upon the subject-matter which he would lay before them. He then proceeded to state the charges in the indictment and to set forth the law as it appeared applicable to this partic[illegible] at very great length on this branch of the subject—going through a number of the cases cited by counsel on either side and concluding with what he conceived to be the settled law of the country on the subject of conspiracy. He then commenced his review of the evidence with the various cards of membership issued and made use of by the Repeal Association, commenting upon them in such a way as could not fail to convey to the Jury that more was meant than met the eye in the several devices and figures printed upon them. His Lordship, in referring to some portion of the evidence, used words to the following effect:—"If," said the Chief Justice, "I have mistaken, the gentlemen at the opposite side will set me right." By this time the hour of five had struck, and his Lordship announcing that he could not finish his charge that evening, the Court adjourned.

Twenty-fourth Day.—At 10 o'clock on Saturday the Chief Justice resumed his charge. Before entering upon his task he said he wished that in anything he had stated on the preceding day it should be distinctly understood that, though he was not satisfied with the authorities cited to him by Mr. Fitzgibbon, he did not mean to say anything disrespectful towards that gentleman, and that moreover he entertained much esteem for his professional talents and private character. He then resumed his comments upon the evidence by observing upon the large funds and flourishing exchequer acquired and maintained by the Repeal Association, and upon the power, organisation and discipline to which that Society had been carried. He next called the attention of the Jury to the paper which it had promulgated called "Plan for the Renewed Working of the Irish Parliament," and said that what it proposed was a *revolution* and that it was sought by the Association not as a matter of *petition* but of *demand*. He next proceeded to review some of the means by which this demand was to be enforced, and particularly the monster meetings, beginning at Mullingar and ending at Mullaghmast. His Lordship considered the last of these meetings to be the most important of all the Repeal demonstrations, as showing what the real intent and disposition of the traversers was. He next proceeded to animadvert upon the establishment of the Repeal Arbitration Courts, their tendency and illegality. He then referred to the case of the Rev. Mr. Tierney, as distinguishable from that of the other traversers, and made some observations calculated to induce the Jury to think more favourably of him than of the other parties accused. He adverted however rather strongly to one speech of an inflammatory character, delivered by the Rev. Gentleman at the Repeal Association, which he seemed to think identified him in point of intent fully with the other traversers. He next referred to the evidence which connected Mr. Duffy with the rest of the traversers, beginning with an article in the *Nation* entitled "Something is Coming," to Mr. Barrett's publications in the *Pilot*, and to the part taken by Dr. Gray in organising the Arbitration Courts. On this point, as constituting one of the principal counts in the indictment, the Chief Justice dwelt at considerable length, and said that if the Arbitration Courts were established "by the traversers with a view of bringing the administration of justice into contempt and disrepute, and to withdraw from the Judges that confidence which the people had in them—if the traversers did these acts, and did them with a common design, then he told the Jury that what they so did was a high misdemeanour—was highly illegal; and that if they conspired to do these things by combination they were guilty of the conspiracy imputed to them in that respect." His Lordship then briefly recapitulated the other grounds of accusation.

"The eight traversers," he said, "were indicted for having conspired and agreed to raise and create disaffection, hatred, and unlawful opposition to the Government and Constitution; to stir up jealousies amongst the Queen's subjects, and to promote ill-will to her other subjects, especially the Irish against the English; to excite disaffection in the army; to collect unlawful assemblages in large numbers in Ireland, in order to obtain changes in the laws and constitution by intimidation and the demonstration of physical force; and to bring the courts of judicature established by law into disrepute, and with the intent to induce the subjects of the Queen to submit their disputes to other tribunals. If they were of opinion that the traversers, or any of them, conspired and agreed to do, or caused to be done, the said several matters or any of them, then they were to find such traversers or traverser guilty of the conspiracy as laid. I (continued the Chief Justice) have put the questions to you in the language of the indictment. It lies upon the Crown to establish, which they have undertaken to do, that the traversers, or some of them, are guilty of a conspiracy such as I have already stated to you, a conspiracy consisting of five branches, any one of which being brought home to your satisfaction will maintain and establish the charges which the Crown have undertaken to prove. But, gentlemen of the Jury, you are never to lose sight of this fact, that criminality or crime is a thing that must be proved, and is not to be merely surmised. Every person, by the law of this country is entitled to have the benefit of being deemed innocent until he is pronounced guilty. The traversers have, one and all of them, made the defence that their designs were not criminal, that they had grievances—that they had a right to complain of those grievances—that they had a right to lay them before the public, though it happened that in so doing they attended multitudinous meetings. If you should be of opinion that such were the designs and obvious intention of the traversers, and that they had no criminal intention, and did not mean to resort to any criminal means for the furtherance of these objects; if that be your opinion, you would be bound to acquit the traversers; but if, upon the other hand, you should be of opinion that these were not the real objects of the association or of the persons charged as traversers here, but that, whatever their apparent designs might be, if they had in fact and in truth the criminal intentions which are attributed to them by the Crown, and if you are satisfied that the traversers, or some of them, in furtherance of this design, acted in common concert, then, in such case you will be bound conscientiously to find them guilty of the conspiracy in which you find them participators. A great deal has been addressed to you which I do not at all intend to recapitulate. You have been pressed by arguments in appeal to your feelings—I would say in appeal sometimes to your apprehensions. You have been addressed by gentlemen of the greatest ability, I believe in greater numbers than ever persons accused of crime have yet had an opportunity of being heard in their behalf. Every topic that could be suggested by ingenuity and reasoning has been discussed—nothing has been omitted. But it has been shown to you that there were other grounds besides the evidence which has been laid before you, which you might properly take into your consideration in arriving at your verdict. In answer to that I have only to state to you that, by the law, you are to hold yourselves as perfectly indifferent parties—indifferent to every consideration except the evidence laid before you as jurors; and remember the oath you have taken is to give a true verdict, according to the evidence; that is your oath. To enable you to do that, I must say you have paid the most marked attention; indeed, I may say, I never saw a jury who, during a long and painful trial, extending over more than three weeks, have paid such unceasing and undeviating attention to the case and the evidence before them as you have. In drawing your conclusions and finding your verdict, you will attend to the evidence before you, and let it be conformable to the dictates of your reason and of your consciences; and I trust that the Lord, who rules over all, will enlighten your direction. I have now no more to say."

At the conclusion of the charge the Foreman said the jury felt very much fatigued, and wished to know whether it would be necessary for them to go into the consideration of the case that night. The Chief Justice said that after the charge had been delivered it was not possible to allow the jury to separate; they might retire to their chamber, but they should remain in the custody of the sheriffs. The Jury then retired at half-past 5 o'clock. Mr. Henn on the part of the traversers submitted that there was no evidence of any act being done within the county of the city of Dublin, and the traversers were entitled to have his Lordship's direction for an acquittal upon that point. The Chief Justice.—Where are the meetings of the association? Mr. Henn.—There is no evidence of their being held in the county of the city of Dublin. Mr. Justice Crampton took a note of the objection. After some discussion on the documents to be submitted to the Jury the Judges retired to their chamber, stating that they would wait there till a reasonable hour, when they would send for the Jury, and if they found it improbable that there would be a verdict would direct them to be taken charge of by some bailiffs. At half-past 7 o'clock Mr. Justice Crampton returned for the purpose of having the bailiffs sworn, and adjourned the Court till 9 o'clock. From the time the Court adjourned until it re-opened, the crowd in the neighbourhood kept increasing, and persons from all parts of Dublin were making their way to the Four Courts anxious to learn the result. Soon after nine Mr. Justice Crampton entered the Court, and shortly after the Attorney-General and Solicitor-General entered and took their places at the Inner Bar. The High Sheriff having intimated to the Jury that his Lordship was on the bench waiting their verdict, the Foreman entered the jury-box and said: My Lord the Jury are not quite ready. The Judge said he would wait and then withdrew. At ten minutes to eleven Mr. Justice Crampton again returned to Court and the Jury were called to their box. The Foreman said: My Lord are we to give our verdict on each count of the indictment? The Judge: If you please, gentlemen. Foreman: Are we obliged to give our verdict on every count? The Judge: Yes. Foreman: Whether we agree or not? The Judge: Yes; but you must understand me. If you are agreed upon each count or upon all the counts you are only to say not guilty or guilty—if you agree upon some you will state those upon which you are agreed, and the names of the traversers with respect to whom you have agreed. Foreman: And take no notice of the others? The Judge: There ought to be a finding on the whole of them. The Jury then withdrew. At 20 minutes past 11 they again came into Court and after the usual formalities handed in a verdict which contained no finding on the first, second, sixth, eighth, ninth and eleventh counts, but found the traversers generally guilty on the others. Mr. Justice Crampton said: You must take your verdict back, for in the present state it is imperfect in some of the counts—in respect of which you have come to no conclusion as to the guilt or innocence of the traversers. It is your duty to return a verdict of guilty or not guilty; and if you cannot come to an agreement on any count or counts you ought to say so in your verdict. With respect to the first count, of course you will say as to so much of it as you find in other counts guilty, or not guilty. A Juryman.—My Lord, we are agreed on the first count; there is no difference of opinion among the Jury, it is merely the wording of the finding that we are at a loss for. The Judge: That is what I thought. You must find your verdict on all the other counts with respect to all the defendants, we shall then be able to take them when you come into court, as to the various points found on the first count. The Attorney-General then rose to make some observations, when he was interrupted by Mr. Moore, who suggested that the Jury should retire. The Jury having retired accordingly, the Attorney-General said the Jury were not bound to find. The first count embraced the several branches of the conspiracy, which are split up afterwards in other words, and if they were of opinion that the several traversers or any of them were guilty, of course they would decide on such portion of the first count as they thought they should find. Mr. Moore said he was not desirous of saying anything in the way of argument, but on the part of one of the traversers, he should object to the direction.—During the observations that were passing between the bench and counsel, the crowds in the hall and in the immediate vicinity of the Court were loudly cheering. As soon as the Jury had given their verdict, some person communicated to the assemblage in the hall that Daniel O'Connell had been acquitted, and the people there immediately commenced cheering, and the shouts were taken up and re-echoed by the crowds outside. When the Jury had retired about half-an-hour, the Attorney-General suggested that as it was just 12 o'clock, and the verdict could not well be given on Sunday, the Court should adjourn until Monday morning. Mr. Justice Crampton said he was anxious to save trouble by an arrangement between the parties. "What do you say, Mr. Moore?" he asked. Mr.

Moore.—Nothing, my Lord. Mr. Henn, Q.C. on the part of the traversers (after some consultation with his learned brethren), said he did not object to a verdict being received after 12 o'clock, nor yet did he consent to it. Mr. Justice Crampton complained that he could get no information from either side. The Attorney-General said he was willing to give all in his power, but the case was a singular one, and lest an objection should be taken hereafter, he thought it the safer plan for the Court to adjourn. Mr. Justice Crampton said that he would not discharge the Jury, as it seemed to be against the opinion of both the Crown and the traversers. Mr. Moore.—Not ours, my Lord; we say nothing. Mr. Justice Crampton.—Is it necessary that this question should be raised? I should be very sorry further to inconvenience the Jury. I should be much better satisfied if the verdict were given to-night. I have received a verdict at 2 or 3 o'clock in the morning in capital cases. The Jury were then called. On their appearing, Mr. Justice Crampton said—Gentlemen, have you now arranged your verdict? The Foreman.—Not yet, my Lord. Mr. Justice Crampton.—It is very near 12 o'clock, therefore you had better be quick [great laughter.] "This noise," observed his Lordship, "is extremely indecent, and I must exercise the authority of the Court if I find any person committing a breach of order." The Jury then retired, and some minutes after it was observed to Mr. Henn that it was 12 o'clock. Some conversation then took place, and finally at a quarter-past 12 o'clock the Jury were called into Court, and informed that it was too late to receive the verdict, and the Court adjourned until 9 o'clock on Monday. Mr. Henn handed a written notice to the Court, in which he took an objection to the power of the Court adjourning after 12 o'clock. The crowds which had assembled in the Court and its neighbourhood, as soon as they became aware of the true verdict, became greatly excited, but there was no appearance of disturbance in the streets. On Sunday the Jury of course remained in custody, and a clergyman of the Established Church performed divine service in the room allotted to them. During the whole day and on the previous night the military were under arms in the Castle-yard, and various arrangements were made to guard against an outbreak, but the event proved that there was no necessity for such precautions.

Twenty-fifth Day.—THE VERDICT.—The Chief Justice, Mr. Justice Burton and Mr. Justice Crampton took their seats on the bench on Monday morning a few minutes after 9 o'clock, at which hour the Court was crowded, but not inconveniently so, as a large force of police was stationed at the main entrance to keep off the crowd and clear the various passages leading to the Queen's Bench to prevent the admission of persons not duly authorised. The traversers arrived at an early hour. Mr. O'Connell, who was accompanied by his son Daniel, and Mr. Smith O'Brien, took his seat at the table of the Queen's Counsel. Mr. J. O'Connell appeared in his professional robes amongst the junior barristers, while the rest sat at the traversers' bar. Mr. Justice Crampton minutely detailed to the other Judges what took place on Saturday evening subsequent to their leaving the Court, and accounted for the difficulty which the Jury had experienced respecting the first and second counts by observing that they contained five distinct issues upon which there should be five distinct findings, and did not therefore admit of a general finding. Having briefly described the nature of the issues involved in the several counts and pointed out in what respects they differed one from the other, his Lordship suggested that the proper course to adopt would be to put these issues before the Jury in the distinct form in which he had now explained them. The Jury were then called into Court; the suggestion of his Lordship was acted on; they retired, and returned at 10 o'clock with their verdict, to the reception of which Mr. Moore, Q.C., objected, on the ground that one of the Jurors was described on the panel as "John Rigby," though he himself had declared that his name was "John Jason Rigby." The Attorney-General observed that Mr. Rigby had been sworn as "John Rigby," and that particular notice was made of the fact at the time by the Crown. A note having been taken of the objection, Mr. Bourne, the Clerk of the Crown, read the verdict of guilty generally against all the traversers excepting the Rev. Mr. Tierney, who was found guilty upon two counts only. The following are the several counts of the indictment, with the verdict of the Jury as affecting each traverser upon each count:—*First and Second Count.*—For unlawfully and seditiously conspiring to raise and create discontent and disaffection amongst the Queen's subjects, and to excite such subjects to hatred and contempt of and to unlawful and seditious opposition to the Government and Constitution; and to stir up jealousies, hatred, and ill-will between different classes of her Majesty's subjects; and especially to promote amongst her Majesty's subjects in Ireland feelings of ill-will and hostility against her Majesty's subjects in other parts of the United Kingdom, especially in England, and to excite discontent and disaffection amongst divers of her Majesty's subjects serving in the army; and to cause and aid in causing divers subjects unlawfully and seditiously to meet and assemble together in large numbers at various times and at different places within Ireland, for the unlawful and seditious purpose of obtaining, by means of the intimidation to be thereby caused, and by means of the exhibition and demonstration of great physical force at such meetings, changes and alterations in the Government, Laws, and Constitution, as by law established; and to bring into hatred and disrepute the Courts by law established in Ireland for the administration of justice, and to diminish the confidence of her Majesty's subjects in the administration of the law therein, with intent to induce her Majesty's subjects to withdraw the adjudication of their differences with and claims upon each other from the cognisance of the Courts of Law, and subject the same to the judgment and determination of other tribunals to be constituted and contrived for that purpose." GUILTY—D. O'Connell, R. Barrett, and C. G. Duffy, omitting the words "unlawfully and seditiously" before the words "to meet and assemble." NOT GUILTY as to the words omitted. GUILTY—J. O'Connell, T. Steele, T. M. Ray, and J. Gray, omitting the words "unlawfully and seditiously" before the words "to meet and assemble," and omitting the words "and to excite discontent and disaffection amongst divers of her Majesty's subjects serving in the army." NOT GUILTY as to the words omitted. GUILTY—Rev. Thomas Tierney, from the commencement, and including the words "especially in England," and NOT GUILTY of the remainder of the first and second counts. *3rd Count.*—For unlawfully and seditiously conspiring to raise and create discontent and disaffection amongst the Queen's subjects, and to excite such subjects to hatred and contempt of, and to unlawful and seditious opposition to the Government and Constitution; and to stir up jealousies, hatred, and ill-will between different classes of her Majesty's subjects, and especially to promote amongst her Majesty's subjects in Ireland feelings of ill-will and hostility against her Majesty's subjects in other parts of the United Kingdom, especially in England; and to excite discontent and disaffection amongst divers of her Majesty's subjects serving in the army; and to cause and aid in causing divers subjects to meet and assemble together in large numbers at various times and at different places within Ireland, for the unlawful and seditious purpose of obtaining by means of the exhibition and demonstration of great physical force at such meetings changes and alterations in the Government, laws and constitution as by law established, and to bring into hatred and disrepute the Courts of Law established in Ireland for the administration of justice, and to diminish the confidence of her Majesty's subjects in the administration of the law therein, with intent to induce her Majesty's subjects to withdraw the adjudication of their differences with, and claims upon, each other, from the cognizance of the Courts of Law, and subject the same to the judgment and determination of other tribunals to be constituted and contrived for that purpose. GUILTY—D. O'Connell, R. Barrett, and C. G. Duffy. GUILTY—J. O'Connell, T. Steele. T. M. Ray, and J. Gray, omitting the words "and to excite discontent and disaffection amongst divers of her Majesty's subjects serving in the army." NOT GUILTY as to the words omitted. GUILTY—The Rev. T. Tierney, from the commencement, so far as and including the words "especially in England." NOT GUILTY of the remainder of this count. *4th Count.*—For conspiring to raise and create discontent and disaffection amongst the Queen's subjects, and to excite such subjects to hatred and contempt of, and to unlawful and seditious opposition to, the Government and constitution; and also to stir up jealousies, hatred, and ill-will between different classes of the subjects, and especially to promote amongst the subjects in Ireland feelings of ill-will and hostility towards the subjects in other parts of the United Kingdom, and especially in England, and to cause and aid in causing divers subjects to meet and assemble in large numbers at various times and different places in Ireland for the unlawful and seditious purpose of obtaining by means of the intimidation to be thereby caused, and by means of the exhibition and demonstration of great physical force at such meetings, changes in the Government and constitution as by law established. GUILTY—D. O'Connell, J. O'Connell, T. M. Ray, J. Gray, T. Steele, C. G. Duffy, and R. Barrett. GUILTY—Rev. Mr. Tierney, from the commencement, so far as and including the words, "especially in England." *5th Count.*—For conspiring to raise and create discontent and disaffection amongst the Queen's subjects, and to excite them to hatred and contempt of, and unlawful and seditious opposition to the Government and constitution. And also to stir up jealousies, hatred, and ill-will between different classes of the Queen's subjects, and especially feelings of ill-will and hostility against her Majesty's subjects in England. GUILTY—D. O'Connell, J. O'Connell, T. M. Ray, J. Gray, T. Steele, C. G. Duffy, R. Barrett, Rev. T. Tierney. *6th Count.*—For conspiring to cause and aid in causing divers subjects to meet and assemble in large numbers at various times and at different places in Ireland, for the unlawful and seditious purpose of obtaining by the exhibition of great physical force at such meetings changes and alterations in the Government, laws, and constitution, as by law established. GUILTY—D. O'Connell, J. O'Connell, T. Steele, T. M. Ray, C. G. Duffy, J. Gray, R. Barrett. NOT GUILTY—Rev. Mr. Tierney. The same verdict was returned on the remaining five counts. 7. For conspiring to cause and aid in causing divers subjects of the Queen to meet in large numbers at various times and at different places in Ireland, for the unlawful and seditious purpose of obtaining by means of the intimidation to be thereby caused, and by means of the exhibition of great physical force at such meetings changes and alterations in the Government, laws, and constitution of this realm as by law established, and especially by the means aforesaid to bring about and accomplish a dissolution of the Legislative Union now subsisting between Great Britain and Ireland. 8. For conspiring to bring into hatred and disrepute the tribunals by law established in Ireland for the administration of justice, and to diminish the confidence of her Majesty's subjects in the administration of the law therein, with intent to induce the subjects to withdraw the adjudication of their difference with and claims upon each other from the cognizance of the tribunals by law established, and to submit the same to the judgment and determination of other tribunals to be constituted and contrived for that purpose. 9. For conspiring to bring into hatred and disrepute the tribunals by law established in Ireland for the administration of justice, to diminish the confidence of her Majesty's subjects in Ireland in the administration of the law therein, and to assume and usurp the prerogative of the Crown in the establishment of courts for the administration of the law. 10. For conspiring to bring into hatred and disrepute the tribunals by law established in Ireland for the administration of justice, and to diminish the confidence of her Majesty's subjects in Ireland in the administration of the law therein. 11. For conspiring to cause and procure large numbers of persons to meet together in divers places and at divers times in Ireland, and by means of unlawful, seditious, and inflammatory speeches and addresses to be made and delivered at the said several places on the said several times, and also by means of publishing and causing to be published to and amongst her Majesty's subjects divers unlawful and seditious writings and compositions to intimidate the Lords spiritual and temporal and the Commons of the Parliament of the United Kingdom, and thereby to effect and bring about changes and alterations in the laws and constitution of this realm as now by law established.—For self and fellows, JAMES HAMILTON.—The verdict having been recorded, the Chief Justice thanked the Jury for the patient attention they had bestowed for nearly a month upon this unprecedented case, admitted the loss and injury it must have been to them, regretted that the Court did not possess the power of granting them compensation (which the foreman in delivering the verdict applied for), and dimissed them. Mr. Moore, on the part of the traversers, demanded a copy of the verdict. The Chief Justice directed that it should be furnished, and the Clerk of the Crown immediately adjourned the Court to the first day of next term, when it will be in the power of the Crown to call for judgment.

Dublin.—At the close of the trials Mr. O'Connell issued an address to the Catholic Bishops of Ireland, invoking their assistance to preserve the peace at the present juncture; and another address to the people of Ireland, imploring them to be quiet, and stating that so far from the question of Repeal being injured by this verdict, they will if they keep the peace for six months, or at the utmost twelve months longer, have the Parliament again in College Green.—The weekly meeting of the Repeal Association took place on Monday, Mr. John O'Neill in the chair. Mr. O'Connell attended the meeting, and said that what he had to say for Ireland was this:—Lord John Russell had given notice of a motion for the next evening on the present state of Ireland; and although he cared little for the Whigs he cared less for the Tories; yet he thought they ought to give as much assistance to him as they could. For his own part he came to the determination not to go over, because he saw very little use in holding out hopes to Ireland. They owed the deepest debt of gratitude to their counsel—to that bright constellation of genius Mr. Whiteside, and Mr. Sheil their own "morning star," to Messrs. Moore, Henn, M'Donagh, Hatchell, and among the junior counsel to Sir Coleman O'Loghlen and Mr. O'Shea. He said that the association was bound to give as much assistance as they could to Lord John Russell in the present debate, particularly as regarded the details connected with the omission of the names omitted off the Jury panel and the dropping of the sheets, which it was said occurred by accident, and as Sir Coleman O'Loghlen and Mr. O'Shea were perfectly conversant with the details of that transaction, he would move that the standing order be suspended in order that they might proceed to London, at the request of the association, to furnish those details when called on. The motion was carried by acclamation.—Mr. Smith O'Brien moved that Mr. O'Connell's speech to the Jury be printed at the expense of the association, and expressed his hopes that the charge of the Chief Justice would be brought before Parliament in order that it might be decided whether it was or was not constitutional. Mr. Maher, the newly-elected M.P. for Tipperary, seconded the motion. Mr. O'Connell assented to the proposal, and said that when he got up that morning he thought he should have spent the evening in prison. He had worked for forty-four years—he had had many triumphs—he had trampled Orange ascendancy under foot, but he was never imprisoned; and he was then ready to suffer that punishment, if punishment it could be called, for the liberties of his country. He was not present at the Judge's charge on Saturday, and as he was an interested party he did not like to say anything on the subject; but of this he was quite certain, that Mr. O'Brien would prove what he had asserted. One of the reasons that he did not go to London was, that he was not quite sure of emancipation, for it was then lame on the right side; it had got a paralytic stroke by the exclusion of Catholics from the Jury-box. If the Jury-box were to be filled with Protestants when Catholics were on their trial, he would not give a twopenny ticket for emancipation; for they might as well call on his friend Tresham Gregg and the Conservative Association to try him if that principle were adopted. The motion was then put and carried. Mr. O'Connell read a letter from Dr. Gray, proprietor of the *Freeman's Journal*, tendering his resignation as a member of the Associat on, on the ground that the Association was liable to be prosecuted for publications in his paper if he continued a member. Mr. Smith O'Brien would not consent to receive his resignation unless under a protest. The resignation was then received, subject to Mr. O'Brien's protest. The amount of the rent was announced to be 643*l.* 0*s.* 3*d.*—Since the above meeting, all the proprietors of newspapers who had been members of the Repeal Association, including Mr. Barret and Mr. Duffy, have followed the example of Dr. Gray, and with[illegible]

names from the list of the Association.—On Tuesday, Mr. O'Connell issued a second Address to the people of Ireland, stating that, subsequently to the meeting, he had some reasons for altering his views respecting his visit to London for the purpose of attending the discussion upon Lord John Russell's motion. "I have formed," he says, "a better opinion of the views with which that motion is brought forward. Besides, it now seems to me quite clear that there may occur in the course of the debate some topics which it would be desirable that I should be present to elucidate. Again, it has occurred to me, that it is my duty to attend once more in my place in the House of Commons, and to protest, in the name of the Catholic people of Ireland, against the attempt made—and, in this instance, I think, successfully made—by the Attorney-General, to repeal the most beneficial part of the Emancipation Act—namely, that which professed to secure for us fair and impartial trial by Jury." Accordingly, Mr. O'Connell left Kingstown on Tuesday evening, accompanied by Mr. M. O'Connell, M.P.; Mr. John O'Connell, M.P.; Mr. M. J. O'Connell, M.P., and Mr. N. Maher, the new member for Tipperary, and Sir Coleman O'Loghlen, one of his counsel in the recent trials. They arrived at Liverpool on Wednesday morning. A large concourse of countrymen awaited Mr. O'Connell's arrival on the pier, who received him with enthusiastic cheers, and drew him in a hackney coach up to the Adelphi Hotel, where he remained during the day, being too fatigued to proceed at once to town. Large numbers of persons congregated round the hotel, and Mr. O'Connell addressed them in a brief speech. He left Liverpool in the evening for London, and it will be seen by our Parliamentary Report, that he was present at the debate on Thursday night.

Miscellaneous.

Madame Catalani.—A letter from Florence in the German papers states that the account copied from the *Journal des Débats*, respecting the alleged death of Madame Catalani at her villa near Sinigaglia proves to be erroneous. It appears that on the contrary she is at present in her beautiful villa in the neighbourhood of Florence and in the best health that could be expected with reference to her advanced age. As a proof of this it would be sufficient to state that on last New Year's-day she had a circle of friends around her at dinner, and that on this occasion the account of her death was read from the French newspapers. The report that her husband M. de Valabreque died in 1828 is equally untrue. He is still alive and likewise resides at Florence. Madame Catalani possesses no villa at Sinigaglia, and in regard to her fortune, she states that the estate where she resides and a few thousand livres of income, is all she has saved from the millions the principal capitals of Europe awarded her.

Law.

COURT OF QUEEN'S BENCH.—*Wharton* v. *M'Kenzie.—College Debt.*—This was an action by a confectioner at Oxford, to recover for goods supplied to the defendant while he was at Oxford. The defence was that the things furnished were not necessaries. It appeared that the things furnished consisted of ices, creams, marmalade, and fruits. Some of these things, such as ices and fruits, were said to have been ordered by the defendant's medical man for the defendant's use while he was suffering under a temporary illness; but it was also shown that some of the things were had by the young man for the purpose of giving breakfasts to his contemporaries. The defendant's father had been an M.P. and was Governor of Ceylon. The Learned Judge who tried the cause (Mr. Justice Wightman) told the Jury to consider whether these things were necessaries for a young man of the defendant's state and degree, and the Jury answering the question in the affirmative, found a verdict for the plaintiff. A rule had since been obtained to set aside this verdict and have a new trial, on the ground that the Learned Judge misdirected the Jury, as he ought to have declared that to a young man *in statu pupillari*, such things could not be necessaries. Mr. V. Lee and Mr. Pigott showed cause against the rule, and Mr. Sergeant Talfourd was heard in support of it; when the case of "Cripps v. Hills" was called on. This was an action of the same sort, and the same defence was set up to it. The things furnished in this case consisted of cocoa, coffee, and other matters for breakfast and luncheon. The case was tried before Mr. Justice Maule, who said that it was difficult to say what were necessaries; that perhaps nothing was a necessary which a man had not; that perhaps bread and water to live on were not necessaries, for it might not be necessary that the man should live. But if otherwise, then coarse brown bread and water and clothes were all that were strictly necessary to his existence. That perhaps even clothes ought to be excepted, for that if clothing was really necessary for him, it was to be presumed that nature would have clothed him. The Learned Judge therefore rejected the question of necessaries or not, and said that the real question was whether according to the habits of society these things were suitable to a young man in the defendant's station in life. The defendant was the son of a country 'squire who drove four-in-hand, and occasionally with the other members of the family visited the son at his rooms at the University, and partook of many of the things which constituted the subject of this demand. The Jury at once found a verdict for the plaintiff. A rule had since been obtained to set aside this verdict and enter a nonsuit. Mr. Whately and Mr. V. Lee showed cause and contended that beyond the general principle of these things being suitable to this young man's situation in life, which was applicable here, it was plain that the father's conduct was an answer to this defence. The defendant was an undergraduate of Magdalen-hall, Oxford; and, as the judges knew, the halls in Oxford were places of more lax discipline than the colleges, and the father, who must have known this, went to his son's rooms, and saw and partook of the things thus furnished. Mr. Sergeant Talfourd, in support of the rule, insisted that the jury ought to have taken the scope of the learned judge's charge, and ought to have found that these were not necessaries. Lord Denman delivered judgment. "This is a case of a kind which is often before the court, and therefore makes it necessary for us to consider what is the rule. The definition is well given by Mr. Baron Parke in a case in the Court of Exchequer. The word necessaries is not confined in its strict sense to such articles as are necessary for the support of life, but may be extended to such articles as are necessary to maintain a person in the place, situation, and degree of life in which his fortune entitles him to move. Now the pleadings in this case exactly raise the question whether these things were necessaries for a person who was proved to be living in college, where things were properly supplied to him for his immediate use, and where he had a large allowance besides. It seems to me that the jury would have been justified in telling the jury, that as to all those matters which were supplied for the visiting of the defendant's friends, there was no evidence of their necessity, but, on the contrary, their necessity was disproved. The question of what are, and what are not necessaries, is generally a question of law. Different matters may be necessary, according to the station of the parties; clothes, for instance, must be supplied, and a watch and some other things of a like kind, may not be unnecessary, but highly proper for a young gentleman who goes into society, where he is expected to wear such things. But for persons at the University, it is impossible to say that anything of the kind here supplied can be necessaries. It may be illiberal and harsh in parents not to pay for articles which have been supplied to their sons, but it is the bounden duty of tradesmen to know somewhat of the circumstances of the party to whom the goods are supplied, and at all events tradesmen should not give credit to young men for goods of this description. If they will supply such goods, they should have immediate payment, or at least supply no more until payment, and that at a short date, was made to them. There is another consideration: this course of dealing subjects young men, and perhaps their families, to serious embarrassments and distress, against which they ought to be protected. However, that is not the ground of my decision; but I could not help making the remark, in answer to the view taken by counsel as to the hardship on tradesmen. We can only look to the rule of law, which I think has been clearly stated, and which it will be most useful to society strictly to enforce."—Mr. Justice Coleridge: "I am entirely of the same opinion. The question is, whether the judge or the jury should be held bound to decide what are necessaries. Both must sometimes be called on. For the richest man at college, diamond rings, pictures, and race-horses, cannot be said to be necessaries: and the question of necessaries may in some cases be a mixed question of law and fact. With respect to what the law will consider necessaries, I think that Mr. Baron Parke has laid down a most admirable definition. The replication here alleges that these things were necessaries, and to decide the issue thus raised, we must look at the circumstances, situation, and degree of the young man to whom they have been supplied. We must do so, and so must the jury; but in considering this question, we must still recollect that necessaries do not, even when thus construed, mean the conveniences, but the necessities of the situation. If we bear that distinction in mind, we must come to the conclusion that things of this sort are not necessaries, even for a young man in this situation. They may not be unsuitable to his situation and yet they may not be necessary for it. There is no justice in talking of hardship to the tradesmen of the university; they have a safe course if they think fit to adopt it. If they do not intend to pander to young men's extravagance, they will refuse to give long credit. Here in this claim credit is given for two years and a half. Can such credit be given without a view to encourage the extravagance of the undergraduate, in the hope that however improper the charges would be paid at last? They ought to see that what they supply is paid for at once, or that they must depend for their payment on what is sometimes called the honour of the young man, for they have no legal right to enforce demands so improperly created."—Mr. Justice Wightman: "I entirely concur with the opinions of my lord and my brother Coleridge. In my directions to the Jury I did not sufficiently limit this question of necessaries by the consideration of the fact that the defendant was then *in statu pupillari*, and was provided with all ordinary necessaries from the college or by the allowance of his father, and that there was no necessity for his obtaining a supply of anything by resorting to a system of credit. I think, therefore, that there ought to be a rule for a new trial." Rule for a new trial absolute in Cripps v. Hills on payment of costs, and in Wharton v. Mackenzie without that condition.

The Queen v. *Patrick Leith Strahan.*—The defendant in this case had been convicted at the sittings after last term of an assault on a boy at Harrow School. Counsel for defendant now attempted to set up a plea of aberration of mind in mitigation of punishment, but the Court considered the charge fully proved and sentenced the defendant to 18 months' imprisonment in the House of Correction.

CENTRAL CRIMINAL COURT.—*The late Duel at Camden Town.—Lieut. Duncan Trevor Grant*, who was said to have acted as second to Lieut. Munro in the fatal duel at Camden-town, was charged with aiding, abetting, and assisting Alexander Thompson Munro, in the wilful murder of Col. David Lynar Fawcett. There were several counts in the indictment. He was also charged under the coroner's inquisition with the wilful murder of David Lynar Fawcett. The Attorney-General stated the case for the prosecution, the facts of which have been so fully and frequently before our readers, that we think it unnecessary to repeat them. The Attorney-General said that the question the Jury had first to consider was whether it would be satisfactorily proved that the prisoner was present at the duel in which Col. Fawcett fell; and next whether if he was there, he was there for any criminal purpose, such as was laid in the indictment. The principal witness for the prosecution was Mr. Gulliver, the surgeon who attended Col. Fawcett at the duel. He said he saw Mr. Grant on the ground, but was unable to state whether he was present when he was called to attend Col. Fawcett after he was wounded. Mr Wilkins addressed the Jury for the defence, strongly insisting that the case was only one of suspicion. Mr. Justice Cresswell summed up, going minutely through the evidence, which he described as chiefly circumstantial, and said that the Jury should be perfectly satisfied that the circumstances would admit of no other solution than that the prisoner was present for the purposes laid in the indictment before they returned a verdict of Guilty. If they were satisfied that he was there with Mr. Munro for the purpose of assisting at the fighting of a pre-arranged duel, then they should find the prisoner Guilty; but if they considered that the evidence was so insufficient as to afford any reasonable ground for doubt, he felt it was unnecessary to direct them to deal mercifully and give the prisoner the benefit of such a doubt, by returning a verdict of Not Guilty. The Jury consulted for a few minutes, and then without leaving the box, returned a verdict of Not Guilty. There was some disposition to applaud evinced in the Court, but it was instantly checked by the officers. Mr. Grant was immediately discharged.

BIRTHS.—On the 7th inst., at Holyrood Palace, the PRINCESS MARIE, Marchioness of Douglas and Clydesdale, of a still-born son.—9th inst., at Grace Dieu Manor, Leicestershire, the lady of A. L. PHILLIPS, Esq., of a daughter.—10th inst., at 18, Spring Gardens, the lady of R. B. SHERIDAN, Esq., of a daughter.—10th inst., in Powis-place, the lady of H. W. BUSK, Esq., of a son.—10th inst., at Pakenham Lodge, Suffolk, the lady of T. THORNHILL, jun., Esq., of a daughter.—10th inst., at Widmore, Kent, Mrs. N. ELIAS, of a son.—10th inst., at Castle Strathallan, Perthshire, the lady of the Hon. W. H. DRUMMOND, of a son.—11th inst., the lady of the Rev. G. WANTED, a young or middle-aged Man, as PROPAGATOR in an Establishment in the neighbourhood of London, where nothing but pot plants are grown. He must thoroughly understand his business in all its branches.—Apply, by letter (post-paid), to A. B., 19, Milk-street, City, stating where he has lived in that capacity.

WANTED.—An active, industrious FARMING BAILIFF who can bring unexceptionable references as to character from his last Situation, and thoroughly understands his business in all its branches. The Farm which he will be required to superintend is about 200 acres, three-fourths of which are Grass Land; therefore he must have a great knowledge of the Rearing, Management, and Selection of Stock, and of the Improvements in the use of Manures. He must be a married man, without incumbrance, and his wife will be required to take the charge of the Dairy and Poultry, to the care of which she must have been previously accustomed. A Scotchman would be preferred.—Direct, post paid, to H. V., Post Office, Hertford.

STAPLETON ROAD NURSERIES, BRISTOL.

WANTED immediately, as FOREMAN in an extensive country Nursery (in connection with the above), a sober, steady, middle-aged Man, who perfectly understands the cultivation of Fruit-trees especially; also the general routine of Nursery Business.—Apply to Messrs. WM. MAULE and Co.

N.B.—No person need apply who cannot be well recommended.

WANT PLACES.—All Letters to be post-paid.

TO NOBLEMEN AND GENTLEMEN.

AS GARDENER.—A married Man, aged 36, who perfectly understands his profession, and has been accustomed to the Management of Land and Stock. Can be highly recommended by the Gentleman he is about to leave, with whom he has lived above eight years. Direct to Z.Z., Post-office, Fairford, Gloucestershire.

AS GARDENER.—A single young Man, aged 24; he has been Foreman to several first-rate Establishments, and can have an undeniable character from his present employer. Direct to B. W., care of Mr. Waller, Postman, Barnet.

AS GARDENER.—A respectable married Man, who understands his business in all its branches, can have the most undeniable reference as to character and capability from the gentleman he has just left.—Direct to G. S., care of Mr. RONALDS, Nurseryman and Seedsman, Brentford, Middlesex.

AS GARDENER.—A respectable married Man, aged 39, without family, who has lived Head Gardener with the Bishop of London, and a Member of Parliament for the City of London, and has taken many prizes for six years. His wife has had the charge of large mansions, and will fill that capacity if required; character most satisfactory.—Direct to A. B., Mr. TERRY'S, Earl-street, Kensington, Middlesex.

AS UNDER-GARDENER.—A respectable young Man, aged 25, of sober and industrious habits, who has a general knowledge of his business, and has been several years in the capacity of Foreman in extensive Forcing Gardens in Scotland, from whence he has arrived in town. Can have an unexceptionable character for ability, sobriety, civility, and attention. Direct to A. B., care of MR. RUSSELL, Gardener, Turnham-green.

AS UNDER GARDENER.—A young Man, who is willing to give 10*l.* for an Engagement at 18*s.* per week, and 5*l.* for one at 15*s.* per week, for 3 years; Surrey preferred.—Direct to A. B., Bayley's Library, Kensington Gravel-pits.

A YOUNG MAN, 23 years of age, who has been brought up in the Nursery business, is desirous of obtaining a Situation in a SEED-SHOP in London. Respectable reference and security can be given.—Direct to A. M., *Gardeners' Chronicle and Agricultural Gazette* Office.

THREE GUINEAS will be given to any Nurseryman or Gardener who will procure a situation within one month for a single Man, aged 32, as GARDENER. He has a practical knowledge of his business in all its branches, and can be well recommended by his present employer and others.—Direct to P. J., at No. 252, Whitechapel Road, London.

IPSWICH HORTICULTURAL AGENCY OFFICE for the sale of NEW AND RARE SEEDS, &c. &c.

LATTER'S VICTORY OF ENGLAND is sold out. The raiser will use the best means of preserving the pure Stock of this celebrated Cucumber.

HAMILTON'S TREATISE ON THE CULTURE OF PINES, GRAPES, and CUCUMBERS, in the same House, by which system the Cucumbers will pay all the expenses of growing, (in addition to a crop of grapes,) 300 lbs. of splendid Pine-apples annually from the same Plants. T. Wild is promised the first supply, and hopes to have the pleasure of forwarding a copy, postage free, to Subscribers, on Tuesday next; this unexpected delay is entirely the printer's fault. 6*s*. per copy.

West India Giant PEA—very prolific; and although the size and shape of Tick Beans, most delicious flavour: 1*s*. 6*d*. a quart.

RENDLE'S TANK SYSTEM OF COMMUNICATING BOTTOM-HEAT; 5*s*. 6*d*. per copy.

A few first-rate Scarlet and Green MELON SEEDS, 1*s*. per packet. A very small quantity of Latter's unrivalled Coxcomb, Balsam, and German ASTER SEED, 6*d*. per packet,

On receipt of post-office order for any of the above, they will be forwarded immediately, free of postage. An extra quantity of Peas will be enclosed to pay carriage.—Thomas Wild, 3, Tavern Street, Ipswich.

GENUINE BEECHWOOD MELON SEED.

R. GLENDINNING respectfully begs to inform the Cultivators of the MELON that he has had presented to him by Sir John S. Sebright, Bart., Seeds of the *true* variety of his delicious MELON; for besides being one of the very best sorts known, it is of easy cultivation and a good bearer. This opportunity will enable gentlemen to procure it *quite genuine*, which is rarely the case, as the following note will testify:—

"Beechwood, Feb. 5, 1844.

"Sir,—I send you a small parcel of the Beechwood Melon Seed. None that I have seen exhibited under that name, nor any that I have seen grown from Seed that has been bought, are of the true sort, but have obviously been intermixed with other varieties. I have grown no other for many years.

"Your obedient servant,

"To Mr. Glendinning. J. S. Sebright."

R. G. has also a few Seeds of the true SION FREE-BEARING CUCUMBER, a splendid variety which has been nearly lost.

Packets of the above sent by post free.

Beechwood Melon per packet . . . 5*s*.

Sion Free-bearing Cucumber, per packet . 5*s*.

R. G.'s Kitchen-garden and Flower-seeds have been selected with great care, and embrace all the new and good kinds.

Chiswick Nursery, near London, Feb. 16, 1844.

JOHN HANCOCK and SON, Nurserymen, Durham, beg to direct attention to their Advertisement of FUCHSIA LOWRYII, NEW FUCHSIAS, GERANIUMS, &c., inserted in last week's *Chronicle*.

Fuchsias.—Fine strong healthy plants of the following will be ready by the 1st of March, and can be sent by Post at 20*s*. per dozen, if the Plants are not required to be too large:—Brockmanii, Balloniflora, Cormackii, Champion (Smith's), Britannia (Smith's), Defiance (Smith's), Exoniensis, Eppsii, Dennisiana, Fairy Queen, Gem (Ivery's), Iveryana, Laneii, majestica multiflora (Knight's), multiflora coccinea (Knight's), majestica (Smith's), noblissima (Smith's), Paragon (Smith's), Rogersiana, St. Clare, Stanwelliana, Swalesii, and Toddiana.

General Descriptive Catalogues of Plants may be had on application, by sending two postage stamps.—Wear Nurseries, Durham.

NEW AND SUPERB FUCHSIAS, VERBENAS, PETUNIAS, CINERARIAS, and other Plants adapted for Bedding.

WM. WOOD and SON, of Maresfield, have the pleasure to apprise their numerous Friends that a Catalogue of the above, including a Supplementary List of New and Choice Greenhouse and Herbaceous Plants, Camellias, &c. &c. is now in course of preparation, and may be had Gratis on application in March, and which will be found to contain every new and desirable variety. A Select List of entirely new and superb Roses will be added.

W. W. & Son will undertake to supply orders to any extent for the above-named collection of Plants, to be sent out early in May.

N.B.—Agents by appointment for Whitney's Chemical, Transparent, Waterproof Composition. Sold in bottles, with directions for use—Pints, 2*s*. 6*d*., Quarts, 4*s*. 6*d*. each.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

JOHN CATTELL, Seed and Nurseryman, Westerham, Kent, begs to call the attention of the Public to his Superior Stock of Seeds, Trees, and Plants, separate Catalogues of which are now ready. Standard and Dwarf ROSES remarkably fine. Bedded plants of the newest and best sorts of Strawberries. A good stock of the New Improved Autumn Raspberry, "Rodger's Victoria," warranted true at 3*s*. 6*d*. per dozen, 25*s*. per 100. A few good plants of Veronica speciosa. Seeds carefully packed for exportation.

J. C. is in want of a few hundreds of seedling Azalea pontica, single stemmed plants, about the size of a common pen-quill, a plant or two of which, as sample, may be forwarded, with price and quantity per Post.

CROSS-LANES NURSERY, near BEDALE, YORKSHIRE.

W. JACKSON and Co., in returning their sincere thanks to the Nobility, Gentry, and Public for their liberal patronage, beg to announce that they can still supply the following of first-rate quality, which will be forwarded with the utmost despatch to any part of the kingdom. Delivery at the railway gratis.

100 select showy Herbaceous Plants, in 50 named sorts, for 25*s*.
100 Dwarf Roses, in 50 named sorts, for 20*s*.
100 Do. in 100 named, very fine sorts, for 50*s*.
100 Do. in 100 do., extra fine sorts for 75*s*.
50 Standard Roses, in 50 splendid varieties, including the fine Hybrid Perpetuals, for 80*s*.

A Large Stock of fine transplanted English Oaks of all sizes.

Catalogues may be had on application, inclosing two postage stamps. A remittance or reference from unknown correspondents is respectfully solicited.—Feb. 20th, 1844.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE MOST NOBLE THE MARQUIS OF AILSA, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL and Co. have much pleasure in announcing they are now supplying fine Canes of the above highly-valuable and much-esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and has been awarded several prizes at various Horticultural exhibitions during the season. As a proof they have not exaggerated its excellent qualities, fruit was submitted to Dr. Lindley, (see *Gardeners' Chronicle* of the 22d July last, page 502), whose opinion of it is as follows:—

"Fastolff Raspberry.—We have received from Messrs. Youell, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find it merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded. It would therefore be unnecessary for Youell and Co. to recommend it more fully, or with greater confidence, to the notice of the public, merely observing, that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

Packages containing 100 Canes	.	.	£2 5*s*. 0*d*.
Do. do. 50 do.	.	.	1 5 0
Do. do. 25 do.	.	.	0 14 0

Package included.

The usual discount to the Trade, when not less than 5*l*. are ordered.

*** Caution.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine unless purchased direct from their Nursery.

YOUELL'S TOBOLSK RHUBARB, Patronised by Her Most Gracious Majesty the Queen, and many of the Nobility, 12*s*. per dozen. For particulars of which see their Advertisement of the 18th November.

TWO NEW SEEDLING PICOTEES.—"Lady Alice Peel," 10*s*. 6*d*., and "Mrs. Benyon," 10*s*. 6*d*. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. Youell and Co., for particulars of which see their Advertisement in this Paper of the 16th of Sept.

FINEST CARNATIONS and PICOTEES.

YOUELL and Co. beg to refer the readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly-esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:—	£	*s*.	*d*.
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	3	0	0
12 ditto extra fine and very superior ditto	2	10	0
25 ditto ditto ditto	5	0	0

The selection being left to Youell and Co.

ARAUCARIA IMBRICATA.

YOUELL and CO., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*d*. per 100, or 30*s*. per dozen.

Fine Plants of CEDRUS DEODARA, 2ft. to 2ft. 8 ins., 10*s*. 6*d*. each.

Great Yarmouth Nursery, Feb. 22, 1844.

RANUNCULUSES.—The season for planting this beautiful Flower having arrived, MESSRS. TYSO & SON, Wallingford, respectfully announce that they can supply from their collection of *Seven Hundred Varieties*, strong roots of most of *the leading Show-flowers*. Priced Catalogues will be sent prepaid to applicants forwarding two Postage labels.

Dahlias.

J. KEYNES, Florist, Salisbury.—"Standard of Perfection," (Keynes).—The finest self-coloured Dahlia in the world! gained the 1st class prizes at Stonehenge, Windsor, Kingston, Surrey Zoological Gardens, and Crown and Anchor, Stockwell; also the 1st prize specimens at Stonehenge Floricultural Society, Stockwell. "It is as round as any Dahlia in cultivation; as complete an unbroken circle as could be drawn with the compasses; and as globular in front as possible. It is symmetrical to a hair, and as double as a Ranunculus. It is so remarkable as to be instantly recognised among a thousand. Colour, deep crimson. It is the flower of the season, and must be had."—*Gardeners' Gazette*, Oct. 14. "The best-grown flower we ever saw, without exception, every requisite to meet the taste of a connoisseur being complied with; good colour, a honeycomb, regularity of growth and disposition in the leaves, and above all, as complete a rotundity of shape as if it had been cast in a mould."—*Salisbury Herald*, Sept. 2, 1843. Plants in May, 1844, 10*s*. 6*d*. "Orange Superb," (Dodd's) first-rate show-flower, 10*s*. 6*d*. "The specimen sent would grace any stand."—Glenny. "Emma Noke," (Dowding's) bluish white, extra fine, indispensable to a first-rate stand, 10*s*. 6*d*. Catalogues containing all the fine old varieties and new flowers for the season may be had on application.—Salisbury, Jan. 31, 1844.

LARCHES, transplanted of Sizes, are still on Sale at very low prices, by Wm. Urquhart & Sons, Dundee.

WILLIAM MASTERS begs to call the attention of the Nobility, Gentry, &c., to his newly and well assorted COLLECTION OF GARDEN AND FLOWER SEEDS, which, being principally grown under his immediate inspection, he can particularly recommend.

100 papers finest Annual Flower Seeds			.	1*l*.	4*s*. 0*d*.
50	do.	do.	.	12	6
25	do.	do.	.	6	6

[If the selection is left to W. M.]

Forwarded by Post without additional charge. POTTER'S ARTIFICIAL GUANO and CONCENTRATED LIQUID GUANO.

Exotic Nursery, Canterbury, Feb. 1844.

NEW AND SUPERB COLLECTION OF SEEDLING FUCHSIAS.

W. J. EPPS begs to announce that he purposes sending out, on the first week in March, Ten Magnificent Seedling Fuchsias, which have merited high opinions from the most distinguished judges of the day. They are very distinct, and possess the finest properties of any Fuchsias yet known.

BRIDEGROOM (Epps').—A fine flower, of great size and splendour, light pink tube, sepals very smooth and rich, beautifully tipped with green, corolla very large, of a deep vermilion colour, very like Chandlerii, but twice the size; of a splendid erect habit, and a very free bloomer.—(This was submitted to the Editor of the *Florist's Journal* in November last. See Answers to Correspondents.) Price 5*s*.

ESPARTERO (Epps').—This flower is of large size, tube long, bright scarlet, short sepals, expanding well, and exhibiting an extraordinary large deep rich rosy-purple corolla, immense bloomer, and a very distinct variety.—(See Mr. Ayres' opinion, *Gardeners' Chronicle*, Nov. 25, 1843, on the article of Fuchsias.) Price 7*s*. 6*d*.

KENTISH HERO.—*A fine flower*, of a beautiful vermilion red tube, and sepals well expanded, exhibiting a splendid puce-purple corolla of great substance, very distinct; fine compact habit. Price 5*s*.

DUKE OF WELLINGTON.—*An immense flower*, of great substance, very rich rosy pink tube, and sepals beautifully smooth and slightly tipped with green, very large corolla, of a rich rosy crimson, sepals expand well, almost reflex; fine free habit. Price 5*s*.

WINSERIL.—(Professor Lindley's opinion, see *Gardeners' Chronicle*, *Aug.* 5, 1843, to Correspondent, *J. W., Tenterden.*) Price 5*s*.

"No. 1, tube long and smooth, of a rosy crimson, sepals open very wide, with the points slightly tipped with green, corolla short, of a rosy vermilion colour, *a fine variety*."—Professor Lindley.

MARIA.—"No. 3, tube and sepals rose-coloured and smooth, corolla large, of a fine bright blue purple, *an old but fine variety*."—Professor Lindley. Price 5*s*.

FLORENCE.—"No. 6, tube smooth, sepals spreading, rosy in colour, with the points slightly tipped with green, corolla rosy-purple; *very pretty flower*."—Professor Lindley. Price 5*s*.

"All these seedlings are good in form, bright in colour, and smooth in texture."—Professor Lindley.

KENTISH BRIDE.—This magnificent flower was raised by H. Busby, gardener to T. L. Hodges, Esq., Hemsted, Kent, and has merited the high opinion of Professor Lindley, Editor of the *Gardeners' Chronicle*; Mr. G. Glenny, Editor of the *Gardeners' Gazette*; and Mr. Ayres, the able writer on the Amateur's Garden. Price 7*s*. 6*d*.

Professor Lindley's opinion, see *Gardeners' Chron.*, July 8, 1843, to correspondent, *H. B.*—"Your best Seedling Fuchsia is No. 4. This is a beautiful variety, seed-vessels bright green, tube and sepals bright rosy scarlet, corolla large, of a bright violet-purple. It is a well-proportioned flower."

Mr. Ayres' opinion, see *Gardeners' Chronicle*, Nov. 25, 1843.

Mr. G. Glenny's opinion, see *Gardeners' Gazette*, Oct. 21, 1843, to correspondent, *W. J. E.—Fuchia*,—"Pink sepals, rich purple corolla, long footstalk. If the habit of the plant be as good as the flower, it is an acquisition."

The habit of this plant is very compact, and of a beautiful rich green glossy foliage, and with its rich pink tube, sepals, and blue purple velvet corolla, forms a lovely object.

EMPEROR OF CHINA.—This is a fine flower raised by the same person as Kentish Bride, and submitted to Professor Lindley at the same time. Price 5*s*. "No 1, which is similar to No. 2, and having a stout tube. This is a fine flower, with less blue in the corolla."—Professor Lindley.

PRINCE OF WALES.—This also was raised by H. Busby, and submitted to Professor Lindley with two others. *An immense Bloomer.* Price 5*s*. "No. 3 is a stout flower of a good colour, with long sepals, which expand freely and expose the corolla, which is of a rosy purple."—Professor Lindley.

*** The Collection, Two Guineas and a half. A remittance from unknown Correspondents. The usual allowance to the Trade where two or more plants are taken.—Bower Nursery, Maidstone, Feb. 22, 1844.

SEED TRADE.—NO MONOPOLY!

J. G. WAITE, in returning thanks for the very liberal support he has received from the Country Trade, begs to assure them that the report so freely circulated by the London Seedsmen as to his being unacquainted with the Seed business is untrue, he having been engaged therein for 14 years as grower and dealer, although he never solicited country orders until this season.

J. G. W. begs to submit a Catalogue of Seeds, &c., which are of first-rate quality; and all orders shall have careful and immediate attention:—

	s.	d.
Waite's Queen of Dwarf Peas . . per quart	21	0

J. G. W. has lately received a large freight of very superior Lisbon Onion, which he offers at 1s. 10d. per lb. Samples may be had by sending a letter inclosing two postage stamps, which will allow purchasers an opportunity of proving the stock before it is wanted for autumn sowing.

J. G. WAITE's priced Catalogue of Flower Seeds is now ready, and may be had on application at his Establishments, Nos. 1 & 4, Eyre-street-hill, Hatton-garden, London.

N.B. A remittance or reference in London is required previous to opening an account.

R. WHITE & Co.'s Collection of Plants, of which a Catalogue is now ready, comprise every variety of Geranium, Fuchsia, Verbena, Chrysanthemum, Dahlia, &c. which is worthy of cultivation. The following collections are offered, the selection being left to the purchaser —

		£	s.	d.
40	first-rate varieties of Geranium . . .	5	0	0
20	,, ,, do. . . .	3	0	0
12	,, ,, New do. . . .	3	0	0
20	,, ,, Fuchsia	1	1	0
40	,, ,, Chrysanthemum . .	1	1	0
20	,, ,, Verbena, including Seedlings which were submitted to Dr. Lindley for his opinion, and reported to be "all very fine," see *Gardeners' Chronicle*, Sept. 30th and Oct. 7th: "*Alfred*: All your Seedling Verbenas are good flowers"	1	1	0
12	first-rate Dahlias	1	1	0
100	fine show do.	2	10	0

The above will be ready for delivery in strong plants the first weeks of April and May; and orders containing remittances will be executed in strict priority. Orders amounting to 5l. will be delivered free.

Agents for the sale of STEPHENSON's Conical Boiler, Tank, &c., which may be seen at work, and can be supplied at Manufacturers' prices. Also WHITNEY's Composition Substitute for Glass.—Poole Nursery.

FLOWER SEEDS—36 Packets, 10s.; 18 ditto 5s., forwarded, postage free, to any part.—Apply to Mr. JOHN BROWN, Albion Nursery, Stoke Newington, London. Any preferred species may be specified in the order. Payment by Post-office order or stamps.

J. H. B. has on Sale an extensive collection of the most approved Plants for greenhouses and conservatories. Parties building large or small greenhouses can be well supplied.

HURST & M'MULLEN, SEEDSMEN and FLORISTS, 6, Leadenhall-street, beg respectfully at the present season to invite the attention of the public to their extensive and well-selected Stock of GARDEN SEEDS, comprising every new and choice variety worthy of cultivation. They annex the names of a few varieties deserving particular notice, for present use, and beg to say their List of NEW AND CHOICE FLOWER-SEEDS, of which they possess an unrivalled collection, will appear at the usual time in "Harrison's Floricultural Cabinet" for March, and in the *Gardeners' Chronicle* of the 2d March.

Agents for the sale of Humphreys's Compound.

HURST and M'MULLEN beg to thank their Friends for the kind and encouraging patronage they have received, and to assure them that all commands shall have careful and prompt attention. —Wholesale and Retail Seed Establishment, 6, Leadenhall-street; Warehouse, 19, Vine-street, Minories.

LAWN GRASS SEED.—Mixtures of the finest kinds of GRASSES and CLOVER, warranted to insure a fine Sward allowing two quarts to the square rod, 14s. per bushel. Sent carriage-paid to London, in not less quantity than half a bushel. Mixtures for Lawns intended to be fed, 10s. per bushel.
JOHN RIVERS, Sawbridgeworth, Herts.

BUSHELL'S Light Seedling Dahlia "EMMA."—Plants in May, 10s. 6d. Colour white, tipped with deep cherry; the petals, form, and centre, good; the largest, most constant, and free in flowering of any Dahlia yet propagated, and has obtained several prizes. "Pet Rival" Plants in May, 5s. Colour, purple maroon; fine cupped petal and free bloomer; exhibited in several winning stands last season. Kennington Rose, Plants in May, 5s.; most constant Rose grown. To be had of Messrs. ANSELL, Camden Town; S. GIRLING, Stowmarket; F. and A. SMITH, Hackney; and J. BUSHELL, 12, Hall-place, Kennington-lane.

NEW SEEDLING FUCHSIA "SIDMOUTHII" will be ready to send out in May next; price 10s. 6d. each, carriage free.—This magnificent variety was raised last year by Mr. BARTLETT, Nurseryman, Sidmouth. It may be considered the finest hybrid extant. The flowers are large and colour brilliant, is a strong grower and prolific bloomer, with fine foliage. A specimen flower was sent to the Editor of the *Gardeners' Chronicle* last October, who spoke so high in its praise that anything further is superfluous, beyond its character as above. Visitors to Sidmouth will be gratified by viewing Mr. B.'s Collection of this lovely and graceful flower; having a mode of treatment peculiarly his own.

*** To secure fine plants early orders are desirable.

RANUNCULUSES, ANEMONES, CARNATIONS, AURICULAS and LILIUM LANCIFOLIUM.

H. GROOM, Clapham-rise, near London (removed from Walworth), by appointment FLORIST TO HER MAJESTY, begs to remind the Nobility, Gentry, and Amateurs, that this is the best season for obtaining Collections of the above Flowers, and that in consequence of the success he had in their cultivation last year, he can offer them at the following moderate prices:—

,,	,, ,, large bulbs, each . .	0	10	6
,,	,, ,, punctatum, good bulbs, each	0	7	6
,,	,, ,, large bulbs, each	1	1	0

Catalogues may be had on application.—Feb., 1844.

ORANGE AND LEMON TREES, from 8s. to 25s. DOUBLE ITALIAN TUBEROSE ROOTS, 3s. per dozen.—R. HALL begs to advise the arrival of his Annual Importation of the above named Trees and Bulbs, which are this year remarkably fine, at his Foreign Warehouse, 63, South Audley-street, Grosvenor-square—facing the Chapel.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Æsculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chesnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which appeared in the *Gardeners' Chronicle*, Oct. 21 and 28.

Nurseries, Clapham, near London, Feb. 16, 1844.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3s. 6d. each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

THE KENSINGTON NURSERIES.

THE LEASE of one of these Nurseries expires shortly, and the Ground being required for building purposes, Messrs. PROTHEROE AND MORRIS are instructed to offer to public competition the invaluable Stock on the smallest of these Nurseries, in the occupation of Messrs. FORREST and Co., and the Stock being far superior to any within a considerable distance, will afford Gentlemen, Noblemen, and others engaged in planting, a fine opportunity to supply themselves, not likely soon to recur. The sale is on the 4th March, and following days, and includes ornamental Trees and Shrubs of every description, variegated and Green Hollies, Evergreen Oaks, and Cork Trees, large Fan and other Yews, twice transplanted Common and Portugal Laurels, Arbutus alaternus, Hemlock, Spruce, &c. May be viewed prior to sale. Catalogues 1s. each, returnable to purchasers, may be had on the premises, of the principal Seedsmen, and of the Auctioneers.—American Nursery, Leytonstone.

TO AMATEUR FLORISTS.

TO LET, at a low Rent, a SMALL HOUSE, with a VERY LARGE GARDEN, Greenhouse, and Pit. Inquire at No. 1, Mapp's Row, Stepney Green.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to Public Competition at the Auction Mart, Bartholomew-lane, on THURSDAY, Feb. 29, 1844, and following day, at 12 o'Clock, about 300 DOUBLE CAMELLIAS, consisting of all the leading varieties, beautifully furnished with bloom-buds; also a fine assortment of STANDARD and DWARF ROSES, AMERICAN PLANTS, DAHLIAS in dry roots, &c. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

*** The Camellias will be sold on Thursday, 29th.

THE NEWEST AND VERY BEST FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c.
FOR 1484.

YOUELL AND CO. beg to refer the Readers of the *Gardener's Chronicle* to their Catalogue of the above, which appeared in this paper of last week, and will be found to contain such varieties only as are worthy of cultivation.—Great Yarmouth Nursery, Feb. 22, 1844.

WILLIAM MASTERS begs most respectfully to inform the Nobility and Gentry of the United Kingdom that he unites the Professions of LANDSCAPE-GARDENER and NURSERYMAN, and this enables him to offer an extensive Collection of Coniferæ Plant, as well as of the Hardy Ornamental Trees and Shrubs cultivated in Britain, at very moderate prices.

W. M. also possesses a numerous Assortment of Hothouse and Greenhouse Plants, many of the rarer species of Orchidaceæ, several new hybrid Crinums, Rhododendrons, Azaleas indica, Camellias, Succulents, Pelargoniums, &c. &c.—Exotic Nursery, Canterbury, Feb., 1844.

CHEAPER THAN EVER!

W. MILLER begs to inform his numerous Friends that he offers the following Beautiful Plants cheaper than last season, viz.,

12 Fine new distinct Fuchsias for	7s. 6d.
12 Splendid Verbenas	3 6
12 Anagalis, fine sort	4 0
Petunia Punctata, per Plant	7 6

See Mr. M.'s extensive List in last week's *Chronicle*, containing every new variety.—Providence Nursery, Ramsgate.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 24, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, Feb. 28	Society of Arts	8 P.M.
Friday, March 1	Botanical	8 P.M.
Monday, March 4	Entomological	8 P.M.
Tuesday, March 5	Horticultural	3 P.M.
	Linnæan	8 P.M.

IN pursuing the subject of LANDSCAPE GARDENING, and attempting in a plain manner to make principles easily understood, we cannot too often repeat that we must look to Nature as our instructress. Not only, however, must we look to external, but to internal nature; that is, into our own mental constitution. It may not have occurred to some, that science, as well as art, is necessary to the exercise of Landscape-Gardening; and few, probably, have imagined that geology can aid us in tracing to their origin the most sublime spectacles which Nature presents to our view. A brief appeal to that science will not appear either uninteresting or useless.

Very little observation and inquiry is needed to satisfy us that the abode of man, this fair world, was made in all respects fit for his residence before he was called into existence. Geologists have observed the effects of the various revolutions which this globe has undergone—that destruction and renewal have been never-ceasing operations—that they are the very basis of creative design; and, when investigated, they appear to be the sources of all our enjoyment—startling as to some the remark may seem. We are taught by geology that what are called strata and rock were all originally deposited in conformity with the curvature of the earth. These have, at different periods, been invaded and broken up by rocky matter in a state of fusion; and finally, it appears, from the extremely disturbed state of the entire crust of the globe, and the elevation of igneous rocks, that a tremendous force acting from below upwards has dislocated the whole, so that immense masses have been erected into the forms of mountains and hills, while others have sunk into the abysses left by the escape of the expansive fluid, which was most probably steam. The bottom of the ocean is as uneven as the surface of the earth; and islands and volcanoes testify what has been done, and by what agency.

Here, then, we find destruction to be the origin of all that is admirable in Landscape, so far as the unevenness of the surface is concerned. To this destruction we owe the stupendous, ragged, and snow-capped mountain, the overhanging precipice, the lake, the valley, and the river. The elevation of the land causes water to flow, and its disturbance has caused the necessity for its being precipitated in the form of falls and cascades, producing many of the most sublime and beautiful spectacles which Nature offers to our contemplation.

It is, indeed, at first view, a strange coalition; nevertheless, without destruction, there could be neither sublimity nor beauty. The association is unavoidable, and fatal to the ideal theory of Taste. To sublimity and beauty destruction has been, and is still, and will be while the world lasts, the servant of all-work; for we find it above us, in the thunder — beneath us, in the earthquake: on every side, in the tempestuous wind, and in the raging billows. Nor do we find it alone in the terrible of Nature's powers. In our quiet and peaceful domestic concerns destruction steers his unregarded course. The hand of the artisan is for ever at work, destroying a part of his materials to render the remainder useful or ornamental. The powers of fire and of water are called upon to clothe us. Destruction gives us food and light; and from the rough block of stone fashions the statue and the temple. Wonderful! that the faculties of man should have been created to derive enjoyment from the effects of what he dreads and shrinks from! To him an All-wise Intelligence has extended blessings which unlimited benevolence had designed. Man, while uninformed, does shrink from destruction, and knows that it awaits himself: but means are placed within his reach, if he would but look for them, by which, freed from all risk, he might go on his way rejoicing, till, reaching the appointed goal, he lays himself down in peace, and resigns his spirit to Him who gave it. Yet, how blind is man! The indulgence by one man of that curiosity which is implanted in him by the Creator himself, is by another scouted as vain philosophy! If one man attempts to turn to a new page of Nature's book, and dares to announce discovered truth, another speedily comes forth to condemn even the opening of the book at all; and because truth oversets his prejudices and his dogmas, instead of casting them away, he grasps them the closer, and shouts aloud, in destructive spirit—Infidel! Atheist!

We beg pardon of the reader; we were nearly leaving our theme behind us, and plunging into a region where we have no present business.

It is obvious that the last great breaking up of the globe took place before man appeared upon it. He was formed to enjoy the existing order of things—what Nature presented in all her aspects, and adapted as his race multiplied, to prefer the regions of perpetual ice, or the heat of the equator. Animal and vegetable life were constituted for every climate—for every scene. The surface of the globe having been fixed, after a convulsion of a magnitude that may have changed its axis, (for we may trace the progress of the rushing of waters which would certainly follow such an event,) we find that, in the destruction of a former surface, provision was made for the formation of soil on the new one. Abundance of loose matter was deposited, and in it vegetation commenced, scanty at first. Plants drawing much of their sustenance from the atmosphere, lived and died after rendering gaseous matter solid; and thus the soil became gradually enriched, and in the course of advancement towards fitness to receive greater variety, others we may suppose were supplied, till, at last, the earth being covered by objects, some of the most delicate beauty, some of stately magnificence, animal life at length appeared, and all was prepared for the being who was to enter on the splendid stage to admire and to adore.—*G.*

WE are assured that many admirers of the POLYANTHUS flower are unsuccessful in its management, simply because they do not study the habits of the plant. It is next to impossible to grow it in a warm sunny situation; it may be done in early spring, but after blooming time it is extremely susceptible of drought, and exposure to a July sun lays it open to the attack of red spiders, which is often fatal to it. The *habitat* of its relation will give some idea in what manner it ought to be treated. The "Pale-faced Primrose" affects sunny banks, it is true, flowering at a season when other vegetation has made but little progress. But who sees Primroses after their blooms have passed away? Sheltered and hidden from the summer heat by the rank vegetation which usually springs up around them, retiring, as it were, beneath the friendly shade of Briars and overhanging bushes, they escape the attacks of those maladies to which their tribe are subject when exposed. This, then, proves that Polyanthuses may be grown to advantage in borders fully exposed to the sun, provided, after a certain period, they are artificially shaded. We have seen them grown and flowered most beautifully by simply having a moveable shade placed on the north side of the bed in the winter and early spring months, and removed to the south side when the sun became too powerful. The situation where we grow a choice collection, is under a bank running due north and south; the bank is crowned with a thick hedge, and the subsoil is a strong retentive clay; on the east, the border is overhung with Plum and other fruit-trees. As a matter of course, till the trees are in full foliage, the plants get the genial rays of the morning sun, which in their early growth is so essentially necessary; and when they most need shelter, these trees, thickly covered with verdure, give them the requisite protection, thus in a great measure imitating their natural habits.

A suitable situation is, we are convinced, half the battle for the successful cultivation of Polyanthuses. Often has it been our lot to witness the vain attempts of people to grow them. They were unremitting in their attention, and their composts were after the most approved receipts; still, all efforts appeared to be attended with a sort of fatality, for after the plants had flowered they began to assume a sickly hue, and eventually became diseased and curled, arising from improper exposure and the subsoil being of too porous a nature.

These details may appear uncalled for to our more practised Floricultural friends, but we are sure that simplicity of description, joined to the repudiation of all quackery, will do more to create a taste for these "gaily-laced" flowers, than the most elaborate and highly-coloured delineations.

We lately noticed a few of the leading varieties which had at various times come under our observation, and to those who may not be conversant with the properties required to constitute a good Polyanthus, or show-flower, we will for their especial benefit and information endeavour to describe them.

The plant itself ought to be in fine robust health, the leaves of a dark-green colour, the rib up the centre of each being clean and semi-transparent. The stem, rising stoutly from the heart, should bear its truss of flowers erect, without being "drawn" or requiring support to enable it to stand. The pips or flowers ought to be in number from five to fifteen, forming a head slightly convex. Superficial observers would suppose that the flower was composed of five distinct leaves or petals. The corolla, however, is monopetalous, with five deep segments, thus forming five apparent petals. We have seen diagrams at various times representing the flower as having six segments; but this is unusual; when it does happen the blooms have a crowded frilled appearance wholly at variance with the flat even character, which is one of the requisites desired by the best cultivators. The centre of the flower must be of a fine clear yellow, more or less intense, without those shades or streaks of reddish brown, observable in some seedlings, and which is very apparent in both the Cowslip and Primrose. The tube is best when surrounded by a slight collar, having, as it is technically termed, "a trumpet eye," conspicuous in the old variety "Tantarara." Some sorts are destitute of such distinction, but this "moulding" as it may be styled, gives a decided finish to that part of the flower. It is also requisite that the thrums or stamens fill the tube, concealing the stigma. This is a point of great importance, as however good its other properties may be, a show-flower in which the stigma prominently occupies the centre—when it is termed "Pin-eyed"—is considered worthless. The segments of the corolla must not cut farther than the body colour or dark ground of the petals; should this be the case the yellow centre has a cracked unsightly appearance, which is often the defect in an old flower styled "The Yorkshire Regent." The ground-colour ought to bear a fair proportion to the eye; in some it is too small, take for instance Lakin's George Canning, alias Clegg's Lord Crewe, in which the yellow is out of proportion. As for shape, the petals, if possible, ought to form as near as may be a perfect circle: those varieties making the greatest approach to this desideratum, of course are best; each petal being margined with a clear yellow lace, similar in colour to the eye, which also strikes from the circumference to the centre through the middle of each. In some cases this lace is neat and even, as in Crownshaw's Invincible, Hufton's Squire Ray, and Cox's Regent; in others, broad and often coarse, as Nicholson's Gold Lace, and Hudson's Morning Star. There is yet another property we would allude to before closing these remarks—it is indispensable that the colours should retain their brilliancy to the last, or in other words "die well." The lace or edge of some varieties is apt to fade, and become of a different shade to the eye of the flower, even when in a state of apparent freshness; this is a serious drawback on the other good qualities, and we are sorry to record that those two fine flowers, Fletcher's Defiance and Nicholson's Bang Europe, are liable to this objection.—*W.*

IT will be seen by an Advertisement in another column, that the Meeting held last Saturday on behalf of the late Mr. Loudon's family, promises "to produce all the advantages that were anticipated from it. The names of a large number of noblemen and gentlemen were mentioned as having already become purchasers of Mr. Loudon's works, and among them those of Prince Albert, the Dukes of Devonshire, Northumberland, Sutherland, and Leinster; the Marquesses of Northampton and Waterford; the Earls of Auckland, Fitzwilliam, Burlington, Radnor, Derby, Fortescue, Mexborough, and Aboyne, with a large number of other noblemen and gentlemen.

A money subscription was also opened, with the names of His Grace the Duke of Devonshire, President of the Horticultural Society, for 25*l.*; J. Cook, Esq., of Brookland, for 20*l.*; Mr. Paxton, for 10*l.*, &c.; and a Committee was appointed to carry into effect the resolutions of the Meeting. We trust that the example of London will be followed by Edinburgh and Dublin. It gives us great pleasure to add, that the sum subscribed, either in money or purchases of books, since the subject was first mentioned in the *Gardeners' Chronicle*, now amounts to £614 11*s.* 6*d.*

RANUNCULUSES.

THE following notes were taken from the private memorandum book of an extensive and successful cultivator of that neat and beautiful Florists' Flower, the Ranunculus, and as the observations were penned in the sunny hours of June, while the ardent admirers of this flower were encircling their respective beds, eagerly investigating,

comparing, scrutinising, condemning, or approving the varieties as they unfolded to their view, and as the notes were originally taken for private guidance, and not for publication, they may, it is presumed, afford some criterion respecting the merits of the sorts described.

Class I.—Selfs.

Œil Noir, very fine, dark rich colour.—Naxara, extra fine dark, (one of the best of its class).—Fête Nocturne, rich purple, fine.—Duke of Bedford, large fine formed crimson.—Giles's Eliza, very fine straw, extra form, super variety.—Costar's Apollo, very fine dark, rather coarse in petal.—Tyso's Laureate, very fine, pure yellow.—Comtesse Plaisance, very fine yellow, good form.—Les Vos, dark purple, very fine.—Rosa Montana, superior bright rosy crimson, excellent form.—Tyso's Nivis, fine white.—Costar's Tippoo Saib, rich, dark.—Condorcet, fine puce purple.—Bouquet Nonpareil, dark olive, very fine.

Class II.

Flavimorus, cream with purple edge, very fine.—Tyso's Victoria, clear white with crimson edge, very fine.—Aust's Henritella, white, crimson-edged, good shape, very fine.—Horatio, yellow-edged, fine, free bloomer, not quite a pure ground.—Tyso's Herbert, yellow with red edge, very fine.—Temeraire, white, red-striped, (one of the best of its class).—Lightbody's William Penn, white with purple edge, very fine, strongly marked, ground colour seldom pure.—Melange des Beautés, red and yellow-striped, (an excellent old flower, merits well known).—Tyso's Alexis, yellow-spotted, extra fine, good form.—Tyso's Attractor, white, with purple edge, large, very fine.—Kilgour's Queen Victoria, cream, crimson-edged, large, and extra fine.—Costar's Coronation, buff, pink mottled, very fine.—Grand Monarque, yellow-edged, fine petals, rather loose.—Aust's Nonsuch, white, purple-edged, distinct, very fine.—Tyso's Felix, buff, with distinct spot, extra fine.—Lightbody's No Mistake, cream, purple-edged, strong marking, very fine.—Dr. Franklin, fine clear white, with purple edge, very fine.—Tyso's Edgar, yellow, coffee-edged, excellent form, extra fine.—Quintin Durward, yellow-edged, very fine colours, rather thin.—Tyso's Delectus, yellow, red-edged, very fine.—Lightbody's Rob Roy, cream, crimson edge, very fine.—Imbert, yellow, with faint brown spot, very good.—Tyso's Flaminius, yellow, with dark spot, extra (one of the best of its class).—Herald, white, crimson-edged, very fine, excellent shape, high crown.—Tyso's Creon, buff, dark edging, very fine.—Glacia, yellow-mottled, large and very fine.—Paxos, white, with deep purple edge, extra fine.—Biddal's Duke of Wellington, yellow, delicate-edged, very fine.—Macrobius, white-spotted, very fine.—Lightbody's Endymion, white, with delicate rose-edging, very good.—Tyso's Premium, white, purple spot, very fine, high crown.—Aust's Queen Victoria, white, with delicate edging, very fine.—Saladin, fine yellow, with faint spot.—Sophia, or Ma Délice, cream, with rose edge, very good.—Tyso's Vendôme, cream, with dark purple edge, extra fine, rather sportive.—Waterstone's Epirus, yellow-spotted, very fine.

The 50 sorts above enumerated are selected for their quality, without respect to their age or novelty, and they will be found worthy of a place in the collections of cultivators for competition.—*W. J.*

A KNOWLEDGE OF PRINCIPLES ESSENTIAL TO THE BEST CULTIVATION.—No. II.

(*Continued from page* 100.)

An ancient philosopher * on leaving Athens for exile (for advocating the unity of the Deity) exclaimed, "There is a straight road to heaven from every country;" so also is there a straight road to truth from every principle in Nature. It has been already stated, that "every operation in Art is limited in its effect in proportion as it diverges from the line of agency which Nature has prescribed for the same end;" † and such I consider is the result of every process in shifting which seeks to attain the highest effects by a succession of causes, each of which is destructive of an ultimate effect in the one which succeeds it.

As it is "the elementary condition of an organised being that favours the mature development of its parts," ‡ so is that development rendered less perfect by every process which retards the operation of its elements; and in every argument to prove that a non-disturbance of functional organs (such as roots, &c.) is essential to perfect and mature growth, we must, consistently with such reasoning, attach an equal, if not stronger importance to such non-disturbance during the earlier stages of growth; because every plant is subject to the law of causal agency throughout its period of life. In short, if the process of shifting prevent plants from appropriating the same amount of atmospheric and solar agency which they appropriated prior to the operation, then such a process (whether considered in a physiological or practical point of view) is an evil, great in proportion to the frequency of its recurrence; and that which is an evil in part is an evil in the whole, as the whole exists but in its parts.

Such conclusions appear to me to be necessarily deduced from the true principles of cultivation, and by such I shall abide until reasons are adduced to show that to produce and maintain a perfect development of the organs of plants "a continued and uninterrupted supply of fluid from the roots" is not indispensable. To hold other opinions would be to abandon the conviction resulting from 15 years' practice, and to forget the experience of my whole professional life.

And in what does the evidence of the truth of these principles consist? it may be asked. In the highest effects of cultivation at the present period is the reply; and without presumption, it may be added, that the highest capabilities of nature are based upon the application of those principles. A good illustration of this is to be found in a leading article at p. 391 (1843), where the rapid and perfect attainment of timber by using seed, instead of seedlings (or transplanted growth) is adverted to, and furnishes conclusive evidence of the superiority of a progressive and accumulative system of cultivation over all others. It also strikingly confirms the truth that "a constant and uninterrupted supply of fluid from the roots is indispensable" to perfect growth.

The same principle was insisted on in a previous paper, by showing that the only natural mode of perpetuating the primary vigour of plants, is by reproduction from seed. In like manner that mode of culture which approaches the nearest to this will be productive of the highest vigour and most perfect proportions. Hence it follows that the several organs of a seed, a bud, a cutting, and a layer, are each possessed of a principle of vitality, varying in power from a seed downwards.

Admitting the correctness of these views, it follows, that since the most valuable results may be attained, by continuing the progressive development of a plant from its rudimentary condition as a seed, such will be the proportionate success attending the imitation of that process in Horticulture.

It has been wisely remarked, that "there is nothing in religion contrary to right reason," and it is equally true that there is nothing in nature contrary to first principles. Much of the difficulty and loss attending their application has arisen from a misapprehension and forgetfulness of the requisite conditions. Men are seldom wise in the exercise of a new power; disappointment is the inevitable result of an injudicious application of powerful agencies, which also meet the counter influence of successful, but inferior modes of culture. For example: the proprietor of an extensive establishment lost many plants; on inquiry, it was found that the person in charge of them had, in the process of potting, omitted bottom drainage, with the exception of a single potsherd. Many persons would, perhaps, have inferred that the deficiency of bottom drainage was the sole cause, but a better informed cultivator would have withheld an opinion until he had ascertained that no modification or judicious arrangement of the soil could have been made equal to the preservation of the plants. Those who doubt the possibility of dispensing with bottom drainage, may be reminded of the increasing evidence in favour of prepared vegetable matter being rendered subservient to valuable purposes; and further, that one of the most extensive establishments in the world has, in the general cultivation of Heaths, for a long time discontinued lower drainage by potsherds, with the exception of a single one over the hole, and this practice is attended in ten thousand instances with uniform success. These facts are not now quoted either in commendation or disapproval of the custom, but to show that there are modes of culture which hitherto have not been satisfactorily explained. Until this is done, first-rate gardening must be content, as the proverb says, to "make haste slowly."

All improvement is a victory won by struggles, and signalised by conflicts with opposing principles. Hitherto we gardeners have been dealing with only the fragments of a system of cultivation, and not with it as a whole. We have been more restricted by general rules, which are limited in their effects, than guided by principles which are perfect in their application. A principle bears the same relation to truth, that a seed does to a plant, the former being a perfect and necessary condition of nature, the latter a perfect and necessary condition of a vegetable. —*William Wood, Pine Apple Place.*

* Anaxagoras. † *Chronicle*, p. 734. ‡ Ibid., p. 734.

ENTOMOLOGY.—No. LV.

The American Blight.—(*Eriosoma lanigera.*)—Such numerous complaints reach us regarding this pest of the orchard, and so many inquiries are made concerning its economy, that it seems advisable to relate its history, and this is the more necessary, since other species are often mistaken for it, leading to great errors and even mischief to proprietors. Many persons have imagined that the Aphides forming the galls on the Poplars and other trees, are the same as the American Blight, and to prove how essential it is to be well acquainted with these subjects, we will quote Mr. Spence's observations in the "Monthly Magazine," where he says:—"In consequence of the ignorance of the orchard proprietors at Evesham, they cut down all the Poplars in that neighbourhood, seeing that they were inhabited by a cottony Aphis, supposing it was the same as the one infesting the Apple-trees, whereas had they been better informed they might have saved their Poplars, for the insects upon them, of this family, never do the slightest injury to the Apple or any Orchard tree."

Early in the spring we may find, on close inspection, a cottony appearance in the chinks of the excrescences found on the twigs of Apple-trees (fig. 1, *a*), and by the time the leaves are expanded the crevices in the back often exhibit the same appearance, and this white filmy substance becomes at last so abundant that threads are drawn out by the wind, very probably containing the embryo young, which soon people the adjoining trees; such, however, is not always the mode by which the disease is communicated. On examining one of these cottony masses, a number of the wingless females will be found, generally closely packed over one another (*a*), their heads being concealed, and smaller ones are running about; the old sluggish females (fig. 2) are of a reddish or plum-colour, with two short six-jointed antennæ and six legs, but nearly the whole of the body is clothed with long white filaments, I believe of a resinous substance, which project far beyond the apex of the abdomen. These females, like all the Aphides, are furnished with a proboscis, which in this instance is tolerably long and stout, and being insinuated through the tender bark it acts like a syphon, by which the sap is conveyed into their soft and expansive bodies. By exudation, and possibly the natural evacuations of the animals, they are mostly surrounded with a reddish liquor, forming globules, and by squeezing the animals the same coloured fluid is expressed from their bodies.

It is often asked, how the American Blight is conveyed to localities where it had been previously unknown, or had been eradicated for a long succession of years? conceiving, as many do, that it is entirely a wingless insect. This pest is no doubt frequently introduced with a young tree, which, however clean it may appear to the careless observer, may contain the latent germs of disease; but there are other causes—I had repeatedly examined Apple-trees, in order to find winged Eriosoma, and after many attempts I discovered them in July and August, in the nests with the wingless females and in considerable abundance. I have little doubt that later in the season winged females may be produced, since such is the case with most of the plant-lice, and if my conjectures be well founded, their appearance in fresh localities is at once explained. The winged males (fig. 3) are pale-green, the head and eyes are black, and the back of the thorax is pitchy, often powdered over with white, becoming cottony on the abdomen, which is broad, the apex pointed; the tubes are wanting, which has led to its separation, with some others, from Aphis, under the generic name of Eriosoma, woolly body; the wings are transparent and iridescent, the superior are very long and ample, with a green stigma, one large marginal cell, a furcate nervure near the tip, the basal branch not reaching the subcostal nervure, and there are two transverse ones approaching each other at their origin, but remote at the outer margin; the inferior wings are small, with a subcostal nervure, sinuated towards the apex, and two oblique nervures on the disc; the antennæ and legs are pale greenish-ochre, rather short and slender, the former are filiform and composed of seven joints, the third elongated; the hinder legs are not elongated, and the tarsi have two joints and are terminated by minute claws; *a* and *b* show the natural sizes of the sexes, and I find the absence of the abdominal tubes, and not the simple apical nervure, is the best characteristic of Eriosoma. I, therefore, expect the Elm-tree gall Aphis will be included in that group and not in Cinara.

It is said that the females begin to lay their eggs in the middle of August, previous to which period I suspect they are viviparous; they are deposited in the crevices of the bark or in the excrescences, and I suppose remain until the spring before they hatch; but it has been asserted that they are breeding throughout the winter, and Salisbury, who seemed to be well acquainted with their economy, states that the young Aphides may be found at all seasons amongst the roots of the Apple-trees. The American Blight loves sheltered spots, and increases most rapidly in valleys and on dry soils, and is said to be much less frequent on strong cold clayey lands. The Codlin and Sweet Apple-trees are its favourite haunts, and it will not, I have heard, attack the Crofton Pippin or Wheeler's Russet. Can this be owing to the smoothness of the bark?

To free the roots they should be partially exposed to the frost and cold, and the application of night-soil and the ammoniacal draining of stables will effectually remedy the evil in that direction. About the end of February the trunks and large branches should be well scraped, the excrescences cut off, and the whole be well scrubbed with soap-suds, after which the same parts may be washed over with a good coating of lime and water, until there is a regular white deposit upon them; when this has been done with attention, and repeated where the slightest reappearance of the Blight has been detected, I have never known the process fail. Those who prefer it may use Tobacco-water, oil and soot, clay and water, or gas-tar; soap-lees, and oil of turpentine, in proportions of three to one, or one part of vitriol to seven parts of water, have also been strongly recommended as washes; but the great secret in curing this disease is to penetrate every crevice with the brush, and to repeat the application two or three times if necessary,—by perseverance the enemy must be defeated.—*Ruricola.*

THE ROSE GARDEN.—No. VI.

(*Continued from p.* 101.)

[By an oversight a part of this paper was printed last week. It is now repeated.]

Mixture to heal Wounds, and mode of Application.—Five-eighths of black pitch, one-eighth of resin, one-eighth of tallow, one-eighth bees'-wax:—or, half bees'-wax, half pitch:—or, one pound of white Burgundy pitch, a quarter

of a pound of black pitch, a quarter of a pound of resin, a quarter of a pound of bees'-wax, two ounces of tallow, one ounce of pounded mastic, half an ounce of saltpetre. Either of these mixtures may be warmed in a small pipkin, upon a moderate fire, and left to melt for three-quarters of an hour. When it is well melted, *and not too hot*, the extreme point of each stock should be dipped in it, so as to leave the thickness of two or three sheets of paper of mixture at the end; or if the stocks be planted, it may be laid on with a brush.

Planting Out.—The stocks being collected, should be laid even according to their several heights on the ground, a trench dug, and a row of the tallest stems placed in it, and in front of that another row of the next size, until all are planted out—care being taken to leave sufficient room between each line for the operator to pass in and out without much difficulty; the earth may then be trodden down, and the plants attached to each other line by line, with a long osier or hazel, in the same manner as the top bar of an iron railing connects the uprights, and they will then be preserved from injury by the wind. The earth in which the stems are placed should have been previously well manured, and time given to permit it to be completely absorbed and amalgamated with the soil.

Shoots.—Stocks planted in November begin to push in the March following; those much later entered, viz., after February, are delayed three weeks or a month. At the time the buds begin to appear it is necessary to look over the stems, from time to time, leaving only those buds which are to be worked, as too many would spoil the appearance of the plant, from starting too low down the stem. The desirable number is one or two to a weak plant—three, four, or even five, to a strong one. If two, they should be opposed to each other; if three, they should form a triangle; if four or five, they should be as nearly as possible equidistant from each other, like the points of a spur-rowel, and all the shoots should be full, free, vigorous, and as near the top of the stem as possible—the lowest being not more than three inches under the upper one; thus a proper shaped head will be formed at once. The remainder of the buds should be rubbed off as they appear, and before they have started above half an inch; and all suckers should be eradicated the moment they are seen.

The reasons for permitting two, three, or more shoots to push, are obvious. First, they make a handsome plant by so doing at an earlier period; secondly, the plant itself occupies less room from its head being rounder; and thirdly, as gusts of wind, slugs, snails, deficiency of sap, with a variety of other causes, frequently destroy a bud after it has taken, if one shoot only were permitted to grow and be worked, many plants would lose a season from accident, whereas it sometimes happens that two out of three buds of delicate sorts will go off, and the third remain vigorous. If a single bud carries the whole strength of the tree, it will also frequently make such a shoot the first year, as shall become so woody at the bottom as to induce the operator to allow it to run too far from the graft, and thus make his plant of a different height to what he intended. This, however, is less likely to occur in England than in France, where the growth of the Rose is much more rapid, and may be obviated by stopping the bud when an inch long, by nipping off the top, which will cause three or four eyes to break, and form a head at once.

(To be continued.)

FAMILIAR BOTANY.

Morphology.—No. IV.

It would be unjust to Goethe, and to his fame as a poet, if his own poetical but truthful view of the phenomena of vegetable development were withheld; and therefore, before proceeding further, I would beg to quote the following passages from Mrs. Austin's literal version of his famous "Metamorphose der Pflanzen:"—

Mark now the progress—how by degrees the plant
step-wise led up, forms itself to blossom and to fruit.
Out of the seed it unfolds itself, soon as the earth
softly lets it forth into life, out of her fructifying lap;
and to the attraction of light, the holy, the eternally moving
commends the tenderest structure of budding leaves.
Simple slept in the seed the (germinating) power; an incipient foretype
lay enfolded within itself, compressed within the husk,
root, and leaf, a rd bud; only half formed and colourless;
thus does the dry kernel protect the silent life;
it shoots, striving upwards, trusting itself to the gentle moisture,
and soon rears itself out of surrounding night.
But simple remains the form in its earliest appearance,
and thus, even among plants, is infancy distinguished.
Quickly, then, a successive impulse, arising, repeats
joint upon joint, built up, ever the primitive type.
Not indeed always the same; for manifold shoots forth,
fashioned out, as thou seest, leaf succeeding to leaf;
more outspread, more indented, more distinct in points and in parts,
which formerly slept scarce shaped, in the lowermost organ.
And so attains it, at first, its highest destined completion,
which, in many a tribe, awakens thy mind to amazement.
Variously ribbed and jagged, on the juicy exuberant surface
free and infinite seems the impulse which causes the growth.
But now, Nature, with powerful hand, suddenly checks the formation,
and gently diverts it towards a higher perfection. [rows,
In slenderer streams now leads she the sap, the vessels she narand quickly the structure betrays the more delicate workings.
The vigorous outshooting force of the branches softly relaxes,
and the frame of the stem takes a more perfect consistence.
Leafless, however, and rapid, up darts the slenderer flower-stalk,
and a wonderful picture attracts the observer's eye.
Round in a circle now range themselves, counted or countless,
the lesser leaves, each next to one like it.
The sheltering calyx, pressed round a centre, unfolds,
and, to finish the work, lets forth the gay coloured crown.
And now Nature blooms, in her highest fullest magnificence,
and limb on limb she displays, upreared in beautiful series.
Ever thy wonder is new, as, on the flower-stalk, the flower
waves above the slender framework of changing leaves.
But this glorious show is the herald of new operations;
yes, the gay coloured leaf feels the all-powerful hand.
Quickly now it shrinks up; the most delicate forms
then on each side strive forward, towards their destined union.
Fondly stand they together, the affianced beautiful couples,
or in numbers around the holy altar are ranged.
Hymen hovers near, and exquisite odours
stream around, with sweet all-quickening power.
Now, compacted together, swell countless distinct germs
of the swelling fruit, in the lap of the bountiful mother.
And here Nature closes the ring of her eternal powers;
but a new one instantly enlinks itself on the former,
that the chain may be lengthened out through all time,
and that the Whole may have life, as well as each several Being.

I wish I had the skill to give the beautiful thoughts of the poet in a language more worthy of his genius.—*R.E.*

Home Correspondence.

Pruning Forest Trees.—The subject of pruning is one that deserves much attention from those interested in the management of plantations. Opinions are so divided with regard to its utility or hurtfulness, that it is of great importance that the true theory should be arrived at, and I shall, therefore, in the following observations, endeavour to contribute my quota towards the furtherance of that object. The motives for pruning are, I conceive, twofold:—First and chiefly, to obtain a tall, straight, well-proportioned, bole or trunk, free from knots and snags; and secondly and secondarily, to admit light and air more effectually to the lower branches of the tree pruned, and of surrounding trees, and to prevent the meeting and interference of these lower branches. This latter object is much assisted, and, perhaps, in some degree superseded, by that most indispensable process in Arboriculture, thinning. The question which, when answered, will decide the efficiency or injuriousness of pruning, appears to me to be—"Does the lopping off of a branch increase or retard the general growth of a tree?" To furnish a satisfactory reply to this question is by no means an easy matter, but I shall endeavour to elucidate it somewhat, by adducing a few facts bearing upon the point. The general principles of vegetable physiology are now sufficiently ascertained, and those that relate to the growth of trees are as follows:—The sap is absorbed by the roots, ascends the stem, traverses the branches, is elaborated in the leaves, and descends again towards the root, depositing a new layer of wood, and also the peculiar secretions of the species. If, then, we deprive a tree of one of its boughs, do we not take from it a number of its digestive organs, its leaves? and do we not thereby impair its growth, at least its increase in thickness? A branch, inasmuch as it bears leaves, is a means of productiveness, and not of waste, to a tree; I should, therefore, be inclined to answer in the affirmative, and to say that pruning, to any extent at a time, must be injurious, at least as far as regards increase in diameter. Let us mark the operations of unassisted nature. A single tree, if left unpruned, and allowed to extend its branches on every side, soon acquires a thick massy trunk, and large boughs, but does not increase much in height. On the other hand, when the trees of a plantation are allowed to remain so close together as to prune themselves, so to speak (and I may mention that plantations of Scotch Fir are generally treated in this way in this part of the country), they shoot up well in height but are slender, and of small diameter. Thus we see that a tree suffered to extend itself laterally will increase chiefly in thickness, and that one which is not permitted to do so will increase most in length. There is one point connected with pruning which I do not think has yet been satisfactorily determined. It is this—"Does a tree absorb the same quantity of sap from the ground when deprived of several of its branches, as it did while they formed integral parts of it?" The elucidation of this question would throw some light on the effects of the operation of pruning. Upon the whole, gradual and cautious pruning seems to be necessary to the obtaining of a lengthy, straight, and smooth stem, avoiding, however, the lopping off of any large limb, except in the case of a fork; and I should be inclined to say that such a system of pruning, combined with careful and judicious thinning, will form the best mode of managing wood to advantage. —*Dendrophilus, Roxburghshire.*

Icehouses.—I beg to offer a plan for keeping ice, that has come under my own experience. Having no properly constructed ice-house, I converted to the purpose a building formerly used as a mushroom-house, which is in a dry and shady situation. The first consideration was, how to get a drainage for the water without admitting the outward air. For this purpose I dug, or rather subsoiled the flooring, a foot or more in depth (the deeper the better), leaving it as loose and friable as possible; upon that was placed a layer of sticks and faggots, upon that again was put another layer of straw, lining the sides of the building with straw, so as to prevent the ice from coming in contact with the brick wall. The ice was then carted in and broken quite small, with wooden beaters; when full the door was shut close, and all admission of outward air was prevented as much as possible by straw, &c. In this way, and at the expense of a few pounds, I have preserved ice for 12 and 18 months. I may observe, an ice-house will be more likely to succeed *above* ground than *under*, and when free from the damp and drippings of trees. Ice will not melt in the hottest sun half so soon as in a close and damp cellar. Put a lump of ice into cold water, and one of the same size before a hot fire, and the former will dissolve in half the time that the latter will. The bed for the ice should be 3 feet above the level of the ground, and this bed should consist of faggots, or something that will admit the drippings to be drained instantly off. This is the way they have icehouses under the burning sun of Virginia, and there they keep their fish and meat as fresh and sweet as in winter, when neither will keep 12 hours, though let down to the depth of 100 feet in a well. A Virginian, with some poles and straw, will construct an ice-house for 10 dollars, as good, if not better, than those which cost our men of taste as many scores of pounds.—*A. E. W. Daventry.*

Qualities of Plants.—Will plants imbibe anything prejudicial, or otherwise, if the matter contained in the soil exists in a superabundant quantity in lieu of their proper aliment—or are they sometimes driven, like animals, from necessity, to make use of unwholesome food which alters the constituents of their bodies? All roots, fruits, &c. have their own peculiar uniform taste; such as a Parsnip like a Parsnip, &c., but they differ occasionally in a remarkable degree. *Grapes* (of Tokay) on slate had a peculiar delicious rich flavour. *Parsnips* (Berlin) on sandy soil were very sweet-flavoured and highly esteemed. *Potatoes* (Penzance, Cornwall) grown on a gravelly soil, and manured with sea-weed were excellent, and tasted like new flour. *Celery* (Sandwich) produced in deep sand impregnated with salt, was very different from that grown elsewhere. *Carrots* (Sandy, in Beds) on deep warm sand with chalk bottom, were very sugary. *Strawberries* (Huntingdon) raised in rich moist loam had a most nauseous flavour; and *Jerusalem Artichokes* (Huntingdon) on the same kind of soil had a watery earthy taste. These have been brought prominently under my notice, but other plants, trees, &c. are likewise affected by the soil in which they grow. Firs, &c. grown on wet land are valueless for timber through being deficient of some particular substance, and having too much of something injurious to them.—*Nemo.* [Plants are unable to reject the fluid matters that are presented to their roots, and consequently, where such matters unsuitable to them exist in land, they and their products are necessarily affected.]

Durability of Oak Timber felled in Winter.—I have been again to see the beam No. 1, from which the bark came, as stated in a former Number. The numerals are thus:—1035, old-fashioned figures; the initials R. M. were evidently cut in the wood at the same period, being of the same breadth and form; the date 1035 is cut on two beams out of the same old building, which beams, as well as No. 1, had been squared previously to being used, as the bark taken off was in the hollows where the squaring did not reach. A timber-merchant and builder is now working up much of this old timber a second time to make ornamental woodwork in a church now rebuilding. It is as hard and sound as ever, and much of the Oak-wood mentioned before near Oswestry, proved by dates to have been upwards of 800 years in use, was used again in building a new church in lieu of the old-fashioned wood-framed house. Here is a proof of Oak-timber, felled with the bark on, having been upwards of 800 years in use, re-used, to endure how much longer I cannot tell; but it has been put in a new house, and to adorn the inside of a new Church. The same builder has very lately taken a piece of Oak-bark, quite fresh and sound, from a beam, proved by date to have been in use 300 years. These facts, I should think, would set the question at rest as to which is the best season to fell Oak, when durability is required. I believe I could procure the piece with the numerals and initials on, should any one wish to possess such a curiosity, by paying a trifle to the owner for carriage, package, &c.; but as it is now exposed to all weathers, it will soon go to decay.—*W. Billington, Oswestry, Salop.*

Fastolff Raspberry.—The history of this excellent variety is as follows:—It was discovered 24 or 25 years since, in the garden of Colonel Lucas, of Filoy House, near Yarmouth, Norfolk (now the property of the Rev. Gibson Lucas), growing close beside an old Laurel hedge, which has been since removed. The fruit being found to possess most of the excellent qualities Messrs. Youell and Co. describe, Col. Lucas's gardener took great pains to propagate and increase it, and eventually its superiority was so manifest that he ceased to cultivate any but it and the double-bearing variety, which this is not. By degrees, through Col. Lucas's kindness in allowing canes of it to be given away, it became almost the only Raspberry cultivated in the village of Filby, and from thence crept into most of the gardens both of the gentry and cottagers in the neighbourhood. About a year ago, Messrs. Youell and Co. commenced advertising it under the name of the Fastolff, from the circumstance of the Fastolff family having some centuries since possessed and lived at Caistor Castle, now an old ruin in the village of that name adjoining Filby.—*Fair Play.* [The remainder of this letter is an advertisement. The only thing which interests the public is the fact above mentioned.]

Hampton Court.—I take it for granted that your Paper is the legitimate medium through which to advocate the rights as well as to record the professional practices of gardeners; and I therefore beg to complain, on behalf of those of my brethren more immediately concerned, of the prevailing practice of keeping open the *gardens* and palace of Hampton Court to the ungodly portion of the public on the Sabbath-day. I say ungodly, feeling assured that no man that either fears or loves God will so spend the day which He has commanded to be kept holy. I am no bigot, and detest all attempts to enforce any kind of religious observances by dint of any mere authority, either spiritual or temporal; at the same time I think it a great hardship on the respected gardener at Hampton Court and those employed under him to be deprived of the invaluable privilege of the Sabbath-day, and not only deprived but harassed the whole of that, more than any other day in the week, for the gratification of a host of profane Sabbath-breakers, who have no fear of God before their eyes. It is a hardship in my opinion to which no gardener ought to be subjected, and if you could be instrumental in any way in getting the nuisance abated, you

would merit the additional thanks of all good men. I am now speaking for the gardeners only, but as I fear your Paper is not the proper medium, I abstain from tracing the evil through other mazes, else I might point to many others who are subjected to like annoyance with the gardeners. Even the worship in the Palace chapel is interrupted by staring, ignorant, and irreligious intruders. I might also allude to the incongruity of a palace and gardens belonging to her Majesty, the recognised head of our "*truly Apostolic and purely Spiritual Church*," being turned into a scene of revelry and profanity on the Sabbath-day. I might inquire, are not Dr. Howley, Archbishop of Canterbury, and the Bishop of London, privy councillors and keepers of the Royal conscience? Why do they not raise their voices against such enormities, and procure the shutting of the gates on the Sabbath-day, that those within may enjoy the Sabbath; I plead for the gardeners—my brethren of the blue apron, and say it is a shame, a scandal, and a hardship (to say nothing of the sin), to deprive them of their Sabbath of rest in the manner now prevalent!—*Q.*

Sugar Refiners' Refuse.—There are some notes on Sugar Refuse in Malcolm's "Surrey" (vol. ii., p. 109.) He says that it is a very powerful manure, and good and permanent if well spread; if badly spread, and the lumps not broken up, it burns the Grass. "Upon arable land it is thought not to answer." W. Coles, Esq., has used large quantities for three or four years past; he uses it mixed with road-sand—about three loads of road-drift to one of scum, and from 20 to 30 loads of this mixture applied per acre. It costs 4*s.* per load. The Hay crop increased nearly fourfold. This in 1805.—*E.*

New Zealand.—In the *Chronicle* of September, 1843, are statements relative to New Zealand being a desirable colony for emigrants. The inclosed extract of a letter from a relative of mine, written about the same date, and after the late unfortunate collision with the natives, is confirmatory of your opinion. "This country possesses many advantages and good qualities, viz., salubrious and pleasant climate, varied and beautiful scenery, no fall of the leaf, the woods green all the year round, fertile land that will yield two crops in the year, that is will produce in all seasons, and also possessing many sources of wealth not yet properly acted upon, all the benefits of which we shall in due time enjoy. I have seen many scenes here which reminded me of the Highlands of Scotland. Port Nicholson is not unlike the upper end of the Cromarty Frith, but much prettier. I have no doubt that by-and-bye, when things are properly settled, this will be a most desirable country for any one desirous of emigrating, particularly Agriculturists. At present the districts available are generally difficult and expensive to clear, and would not suit a poor man unless he worked hard himself; but when the native question is settled, fertile districts that are known will be thrown open. I should advise any one intending to purchase land to bring out their money and see what they buy, instead of playing at 'blind hooky' with their all perhaps. For my own part I continue to like the country and climate well."—*J. S., Wellington, New Zealand, September* 15, 1843.

Feeding of Bees.—It will be recollected that the spring months of last year were wet and cold, and continued so up to swarming time; during that period I fed successively my stocks and swarms. I likewise did the same in October, and I have not lost a single stock; on the contrary, they are very quiet, and have plenty of food. The Bees kept more in the hive during the mild weather in December and January than ever I remember them to have done, arising, no doubt, from their having been fed. I was induced to try this plan through reading "Milton's Practical Bee-keeper," a work which all who keep Bees should possess, and follow its directions, for by so doing many Bees' lives would be saved. I agree with the author, that more depends upon the food than the size, shape, or material of which hives are composed. As the season is approaching when Bees may require feeding, those who are inclined to pursue this plan, will soon have an opportunity, and I doubt not that they will reap an equal advantage.—*A Bee Preserver.*

Management of Bees.—Rule 1. Never kill your Bees. Rule 2. Never allow your Bees to swarm. Place an old stock of Bees on the middle of a board large enough to contain three hives, and on each side of the old stock place a wooden hive, nine inches high, and 11 square inside; or a straw hive with a wooden top. The boards forming the wooden hives should not be less than 1½ inch thick. On the top of each of the side hives there should be a hole two inches in diameter, with a plate of zinc to slide over it, or a cork to fit it. Over the hole, in the inside of the hive, should be fixed another plate of zinc, pierced with pin-holes all over it. These small holes are for the purpose of ventilating the side-hives, thereby preventing the Queen from laying her eggs in them. Should the Bees fill the holes, they must be re-opened. The board on which the hives are placed should be so prepared with passages that the three hives may be united or disunited at pleasure by means of slides made of zinc. As soon as the Bees are likely to swarm, open the passage between the middle hive and one at the side, and force the Bees to pass through the latter by stopping up the mouth of the former. When the Bees have filled one side-hive with honey, let them into the other side-hive, and remove the first, now fit for use, by stopping its communication with the middle hive. Slide some sheet-iron under it, and remove it to another part of the garden in the heat of the day, and the Bees will readily return to the parent stock. The honey will be found quite free from larvæ and farina, if the ventilation has been properly attended to.—*C. A. A. Lloyd.*

Bees.—As I perceive by a recent communication from Dr. Bevan, that he has removed from Llanferry to Montgomeryshire, I am curious to know what arrangements he found necessary for the conveyance of his hives of Bees from one place to the other. If he would be so kind as to afford this information, he would gratify *C. L.* P.S.—Have any tidings been received of the fate of Mr. Cotton's Bees, for whose transport to New Zealand he made such elaborate preparation?—*C. L.*

Societies.

HORTICULTURAL SOCIETY.

Feb. 20.—Sir C. Lemon, Bart., M.P., in the chair. H. Warre, Esq., was elected a Fellow of the Society. From Mr. J. Brewster, gr. to Mrs. Wray, of Cheltenham, was a plant of Lælia superbiens, having a spike about 5½ inches long, of pretty purple blossoms, which, although truly beautiful, were not so well coloured as could have been wished; but it frequently happens that Orchidaceous plants fail to produce their first flowers well, and very possibly this may improve in course of cultivation. This plant, the honour of first flowering which belongs to Mrs. Wray, and which has created so much interest, is a native of Guatemala, where it was first discovered by Mr. Skinner—the finest specimens being in ravines, and growing out of the fissures of rocks sheltered from north-west winds. Some of the plants have bulbs 22 inches high, and flower-stems four yards long having 22 flowers. Mr. Hartweg, who also met with it in abundance in the neighbourhood of Chantla, where it is planted by the Indians in front of their doors and exists in immense quantities, says that the length of the stem, being four yards, is uncommon, and that the average number of flowers in clusters is from seven to fifteen. A strong plant of this is also in flower in the garden of the Society, growing on a block, where it succeeds well. According to Mr. Skinner, it thrives best in a temperature from 55° to 65°. Mr. Brewster also sent cut flowers of Phycella ignea a Chilian bulb, having beautiful bright-red flowers; this is not hardy, but might possibly be made to succeed in a dry border, if planted out at an early period, and protected by sand being laid over the surface of the ground, the great fault of bulbs from that quarter being their making an attempt to grow during our winter. From the same collection was also a Cryptandra, having a fragrance somewhat resembling that of a Hawthorn; a large Silver Medal was awarded for the Lælia superbiens. Mr. J. Robertson, gr. to Mrs. Lawrence, sent Phaius Wallichii, in good condition, having large brown and white blossoms; Oncidium Cavendishianum, that has kept in bloom nearly five weeks; Hippeastrum aulicum, with large red flowers; a variety of Cyrtochilum maculatum, and a large plant of Cymbidium aloifolium. From the same collection were likewise Oncidium reflexum, a Maxillaria, with a pale-coloured blossom; well-grown plants of Dendrobium Wallichii, and D. pulchellum, the latter twining gracefully over a globular trellis, filled with Moss. There was also Bletia havanensis, with pretty purple blossoms, and a well-grown plant of the brilliant scarlet-flowered Centradenia rosea, which has the good property of being a very profuse bloomer. Mr. Robertson also sent Begonia manicata, a plant of recent introduction, with pretty flesh-coloured blossoms. This plant, on account of its long white hairs under the leaves, and large brilliant manicate scales, has a curious appearance. Oncidium longifolium was also in the same collection, and a beautiful plant of Epacris variabilis, completely covered with blossom; a Knightian Medal was awarded for the three last. From Mr. Kennington, gr. to F. G. Cox, Esq., of Stockwell, was the rare Phalænopsis amabilis, on a block, having very conspicuous large snow-white blossoms. From the same were also Huntleya violacea, Cyrtochilum maculatum, a pretty plant of Phaius intermedius, Bletia Tankervillii, and Brasavola nodosa, with small white and green flowers; a Banksian Medal was awarded for the Phalænopsis amabilis. Mr. Gaines, of Battersea, sent for exhibition seven varieties of Camellias. From Mr. W. Scott, gr. to C. Barclay, Esq., was a cut specimen of a flower from a bulb sent from Peru by Mr. Hartweg, having a stem about three feet high, with curious green and red blossoms; a Certificate was awarded. From Mr. J. Wells, gr. to W. Wells, Esq., were cut flowers of Camellias, and a fine plant of an Enkianthus, quite covered with pretty flesh-coloured bell-shaped flowers, having considerable resemblance to the old E. quinqueflorus. Mr. Fortune found these shrubs growing in abundance on the mountains of Hong-Kong; a Banksian Medal was awarded for the Enkianthus. Mr. J. Plant, gr. to J. H. Schroder, Esq., of Brixton, sent a very large specimen of Epidendrum odoratissimum, having a fine panicle of dingy yellow blossoms; a Certificate was awarded. From Mr. Henderson, of Pine-apple-place, was a beautiful small plant of Epacris impressa alba, the pretty Erica mutabilis, remarkable for its long season of flowering; Begonia manicata, B. coccinea, with brilliant scarlet flowers, a beautiful plant of Dendrobium nobile, completely covered with blossoms, and a specimen of Franciscea latifolia, which besides possessing the agreeable fragrance of F. Hopeana, is a free grower; a Banksian Medal was awarded for the two last. Mr. Ayres, gr. to J. Cook, Esq., sent two seedling Cinerarias, one being a bright blue, and the other a purple. From J. Allnutt, Esq., was an excellent specimen in a large pot, of the double white Primula, the leaves of which being of a bright green, were perfectly free from spot, and the flowers were beautifully white; a Certificate was awarded. W. Jackson, Esq., of Salcombe, Kingsbridge, Devon, sent specimens of the Seville Orange, Malta Sweet Orange, Shaddock, and Lemons, that had been grown on an east wall, protected only by a glass frame in winter; they were large, well-coloured fruit; a Certificate was awarded for them. From J. Moorman, Esq., were nine sorts of Pears, including Passe Colmar, Ne plus Meuris, Jean de Witte, Merveille d'Hiver, Beurré d'Aremberg, Glout Morceau, Beurré Rance, Easter Beurré, and Winter Nelis, all in excellent condition; a Certificate was awarded for them. Dr. Henderson sent an English specimen of Turk's Cap Gourd for exhibition. From the garden of the Society were Dendrobium nobile and cucullatum, Epidendrum macrochilum, Oncidium ensatum, a pretty plant of Phaius grandiflorus; Spiranthes cerina, sent by Mr. Hartweg, and a species of Stenomesson from the same; also plants of Epacris nivalis, E. campanulata alba, and a seedling Epacris, with two pretty plants of the double pink Primula sinensis that were raised from cuttings struck late in autumn. The soil in which they are growing is mixed with superphosphate of lime, which seems to be more beneficial to plants than any substance of a similar nature yet discovered. There were also flowers of Chimonanthus fragrans, grandiflorus, and parviflorus. Cuttings of the following fruit-trees from the garden were also distributed, viz., Werder's Early Heart Cherry, a very fine large black heart-shaped Cherry, which ripens much earlier than the May Duke. It was received from the Continent, and, according to Baron Trucksess, was originally obtained from the Royal Prussian gardens so long back as 1794; yet it is scarcely in cultivation in this country, where it was not known until introduced by the Society. Along with this was also distributed the Early Purple Guigne, Ickworth Imperatrice Plum, and Royale Hâtive Plum; the latter is exceedingly rich, resembling in appearance the Reine Claude Violette; but it ripens earlier and the shoots are very downy, whereas those of the R. C. Violette are quite smooth.

LINNEAN SOCIETY.

Feb. 20.—The Bishop of Norwich in the chair. A collection of specimens of dried fruits were exhibited, presented to the Society by Dr. Boott. A paper was read on Asiphonia, a new genus of plants belonging to the family Aceraceæ, by W. Griffiths, Esq. A description of the genus and of the species A. piperiformis was read. This plant, besides the structure of its flowers, which are remarkable, presents some peculiarities in its stem. The pith is very large, and the wood is disposed in a wedge-shaped manner, with large medullary rays interposed. A second paper was read from Mr. Griffiths on Hydnora, a genus belonging to the natural order Cytinaceæ. The species examined was the H. Africana, which the author had received from Mr. Harvey, from the Cape of Good Hope. Although this plant had been described by Brown, and figured by Bauer, the author had ventured on another description. The plant is parasitic, mostly on Euphorbiaceæ. The anthers had been described as multilocular, but such a view he did not consider consistent with their structure. The pistillum is altogether one of the most remarkable in the vegetable kingdom. The stigma has a peculiar stellate arrangement, similar to Papaver and Nymphæa. It was looked upon as multicarpellary, but the author was inclined to think the whole pistillum was formed from a single leaf. The placentæ were not, as described by Endlicher, parietal, but were free and pendulous, with their whole surface covered with ovules. This would form a fact opposed to Schleiden's placentary hypothesis. Meyer had supposed that the ovarium was composed of three parts. The two papers were illustrated by drawings.

BOTANICAL SOCIETY OF LONDON.

Nov. 17, 1843.—The President in the Chair. Dr. Bromfield presented a species of Calamintha, new to the British Flora, discovered by him in the Isle of Wight. Read, "Notes of a Botanical Excursion in Warwickshire, Worcestershire, Wales, and Ireland," by Mr. S. P. Woodward.

Reviews.

Mrs. Loudon's Glimpses of Nature (Grant and Griffith) is an account of the natural and other curiosities observed by the authoress during a visit to the Isle of Wight. It contains much agreeable information concerning the plants, shells, birds, and insects; the houses, streets, men, and places, that were met with; and we recommend it to the favour of those who are going to the Isle of Wight, as a useful "handbook" for their children.

The Tree-Lifter; or, a new Method of Transplanting Forest Trees. By Colonel George Greenwood. 8vo. Longmans.

If this book were the production of a person whose life was known to have been spent in researches into Vegetable Physiology, we should give him credit for the justness of some of his views, blame him for his crotchets, and censure him for his want of acquaintance with the works of modern writers. If it were the work of a logician we should cavil at his argumentation, and quarrel with his *non sequiturs*. But the child of an officer of the Household Brigade, who has had other duties to attend to than those of reading the works of Vegetable Physiologists, or studying Archbishop Whateley, may claim to be measured by no other standard than that of utility and good sense. Thus measured, Col. Greenwood's book is much above the standard.

It may be looked at in two points of view,—the practical and the physiological.

The practical part consists, firstly, of directions for employing a new kind of plant-lifter, which is so simple, "that a day labourer may use it, and plant daily a tree of from 25 ft. to 30 ft. high;" for the construction and application of which we refer to the work itself. Secondly, of instructions for pruning fruit-trees, which we are happy to

find in all essential respects similar to those which have been constantly advocated in this Journal; and thirdly, of directions for transplanting, in which there is much excellent advice; but also several things in which we cannot concur. The gallant author's opinion concerning the action of roots, appears to us more especially a mistake, as we hope to show on another occasion.

In the physiological division of his book Col. Greenwood discusses the function of leaves and roots, most justly objects to the opinion that leaves are essentially organs for absorbing moisture, as Bonnet and Liebig have asserted, demonstrates as others have done before him, the error of supposing that sap rises only by the sapwood of trees, and cleverly disposes of the now exploded doctrine of root-secretions. We must quote his remarks upon the latter subject.

"I should doubt the supposed excretion from the roots of substances unnecessary to the growth of the tree. If this were so, the roots would soon be surrounded with such substances, and would be incapable of absorbing nutriment. In chalk districts eternal woods are found composed of nothing but Beech; in other soils of nothing but Oak. The oldest Vineyards and the oldest Hop-gardens are the best. (I say nothing of old meadows, since trees are in question.) In all these cases, if the roots excreted substances unfit for nourishing the plants, the whole soil would have become saturated with them. Land-plants grown in water are always unhealthy. Under these circumstances, may not colouring matter, or other substances supposed to be excretion, be the result of disease and decay, or partial maceration of the roots. There is no discoloration of the water in which the seedlings of forest-trees are made to grow.

"I imagine that the roots of trees, in absorbing the moisture with which they come in contact, give off the unnecessary parts of this by transpiration in the air. I do not perceive what should cause roots to transpire when surrounded by moisture, or if they do, they must return like the dog to his vomit, and again absorb their own transpiration."

This kind of argument, added to the experimental denial given to the statements of Macaire, which, however, Professor Liebig regarded as *necessarily as well as experimentally true!* must we think put an end, in this country at least, to all speculations upon the subject.

Colonel Greenwood considers the worst time to transplant a tree to be when it is shooting, and the best time to be as soon as possible after it has shot; *that is, as soon as it has formed its winter bud:*—

"This will differ in different trees. Some are fit to transplant in June, or even in May. The best months for transplanting the generality of English trees with the ball of earth, are July, August, and September; for though the upward growth has then ceased, the growth in diameter, and the downward growth, that is, the elongation of the roots, is in the fullest tide."

This is to a certain extent our own view of the question (see Theory of Hort., chap. 16), although our reasons are different; but we cannot go to the same length as Colonel Greenwood, in the absence of evidence, which he does not give. For we cannot regard as evidence the statement that he has transplanted trees of about 25 feet in height in *every* month of the year without a single failure, and without the plants feeling their removal. We have no doubt of the fact; Colonel Greenwood's assertion is sufficient; and, in the absence of his assertion, we should think it probable. But what we want to know, and what we do not find mentioned, is under what exact circumstances these trees were removed; how long they lived, and what sort of growth they made the following year,—very material points for consideration.

These, however, and some other questions, we reserve for future discussion. In the meanwhile, we cannot but express our regret that more men, with the clear views of Colonel Greenwood, and the same habit of thinking for themselves, do not apply to the study of a subject so useful as Vegetable Physiology, so capable of conveying exquisite pleasure, and which is, to use his own forcible language, of "the first importance to the existence of man and the honour of his Creator."

Miscellaneous.

The Gladiolus.—The Gladiolus communis, a native of the south of Europe, is very generally known, and is to be found in the most humble cottage-garden. Such is, likewise, the case almost with the G. byzantinus, introduced two centuries ago, from the environs of Constantinople. These two species have afforded a great number of varieties of different shades, such as white, rose-colour, orange and vermilion, purple and lilac. Their varieties are all of easy cultivation, and will endure the winter in the open ground provided they are in light and rather dry soil. They require a change of soil and situation every two or three years: for experience proves that by this treatment the number and size of the flowers are increased, and their colours become brighter and more distinct. Towards the middle of the last century, new species of Gladiolus began to be introduced from the Cape; but their merits were not such as to render their cultivation general; and few of them are now to be met with, except in large collections and botanic gardens. The object of the present communication is to point out more especially those varieties of Gladiolus which, instead of being consigned to oblivion or only noticed by the amateur with indifference, merit, on the contrary, his care and attention. They are Belgian productions, resulting from judicious crossing. By this means various new varieties have been obtained which surpass the finest we hitherto possessed of this genus, namely the G. cardinalis and floribundus, introduced from the Cape in 1788 and 1789, and the G. ramosus. The G. psittacinus, perroquet, or Daeleni, was introduced after this period. It was brought from Java, in 1823 or 1824, in a Dutch vessel, to Rotterdam, and having been obtained by Dr. Dael, of Brussels, it flowered with him for the first time, and was accordingly named after him by Horticulturists. In addition to Gladiolus Colvilli, pulcherrimus, ramosissimus, and a great number of other very fine varieties with which the Horticulturists of Haarlem have enriched the trade, the formosissimus deserves particular notice, as being the finest we have seen in flower in 1842. This variety unites the habit and abundant flowering of the ramosus with the colour of the cardinalis, though scarcely so brilliant. All these varieties have a family resemblance to the ramosus, floribundus, and cardinalis. They are not, however, to be compared with the brilliant novelties obtained at the Duc d'Aremberg's seat, at Enghien. Beddinghaus, a young man of good intelligence and education, and in every respect capable of directing such an establishment as that at Enghien, fertilised the G. psittacinus with the floribundus, the ramosus, and the cardinalis. This crossing was made in the summer of 1837, a season favourable for such operations. Seeds were ripened, and from a sowing of these the G. gandavensis was raised. M. Louis Van Houtte having obtained this variety, thus announced it in his catalogue for 1841:—"I have the stock of this Gladiolus, with the exception of two bulbs possessed by one of my brothers. At the moment I write all Ghent comes to admire it. In stateliness and colour it exceeds all we have seen amongst the Gladioli. Its dimensions surpass those of G. ramosus; its majestic flowers, to the number of 18 or 20, are of the most charming vermilion; their inferior petals, adorned with chrome, amaranth, and brown, are again relieved by anthers of an azure hue, which descends to the centre of the flower." This description, doubtless made in a moment of admiration and enthusiasm, is, however, little exaggerated. If properly cultivated, the plant will produce flowers corresponding with the above description. Many other varieties, from the same sowing, much surpass even the G. gandavensis. Several of these have already appeared in the catalogue of M. Jacob Makoy, of Liége, for 1842. Others are not yet in the trade. The names of the former are Baron de Pronay, De Candollii, Grétry, Herberti, Lowii, Pfeiferii, Reine des Belges, Salmianus, Schwarzenbergianus, splendidus, and Sternii. With regard to their culture, it may be stated that they succeed very well in the open air, planted in leaf-mould. They are taken up towards the end of September, after their stems are completely withered. The offsets and bulbs are preserved during winter in a dry place, protected from frost. They are replanted in the open ground in the beginning of April.—*J. de Jonghe, in Revue Horticole for Sept.*, 1843. ‖

The New Indian Black Dye.—Some weeks since we stated that a new black dye had been discovered in the Shan country, and that a small sample of it had been sent over to this country to the Society of Arts. A report on this new dye, recently laid before that Society by Mr. Edward Solly, appears to bear out the previous statement, by showing that it is really a black vegetable dye. The quantity sent was too small for any detailed chemical analysis to be made, but its leading chemical properties have been ascertained. Mr. Solly describes the colour as being insoluble in water and all ordinary solvents; but, deoxidised by sulphate of iron and lime, it becomes soluble, like indigo. The colour likewise resembles indigo, in being destructible by chlorine, but differs from it in not subliming like that substance. Careful experiments were made in the hope of purifying it by sublimation, but without success, as the dye was decomposed; but no sublimate could be obtained. When heated, the dye does not melt or soften, but burns with a bright clear flame, emitting a strong and disagreeable odour; hence it plainly differs from the black resinous matters obtained from the Melanorrhœa, and similar trees. The quantity of ash which is left after burning is so small, that it is evident that the dye is a pure organic substance, and that the colour is quite independent of iron or any other inorganic matter. Mr. Solly concludes from his experiments, that it is a new colour possessed of very useful properties, and considers that it is likely to prove a highly valuable dye stuff, if it can be procured in large quantity.

Large Trees.—Measure, &c. of four trees, standing and growing at Nettlecombe, property of Sir John Trevelyan, Bart., January, 1840: *Elm Tree.*—813 ft., or 20 ton 13 ft., is 40 ft. to the fork; a branch at 50 ft. high is 9ft. in circumference; extreme height of tree 100 ft. At 4 ft. from the ground is 17 ft. in circumference. *Oak Tree.*—603 ft., or 15 tons, 3 ft.; its extreme height 80 ft.; at 4 ft. from the ground is 16 ft. 6 in. in circumference. *Beech Tree.*—709 ft., or 17 ton, 29 ft.; its extreme height 100ft., at 4 ft. from the ground is 18 ft. in circumference. *Chesnut Tree.*—373 ft., or 9 tons. 13 ft.; its height 60ft.; at 4 ft. from the ground it is 17 ft. 4 in. in circumference.—*An Elm* at this place, planted about 1770, contains 480 ft.; that is 300 ft. in the trunk, and 180 ft. the top and branches. From the ground to the fork it measures 32 ft., and at 16 ft. high is 12 ft. 4 in. in circumference. The top or principal branch, contains 60 ft. of timber; another branch contains 30 ft., and three other branches 20 ft. each; other branches from 3 ft. to 13 ft. each; other branches not reckoned in the above, but containing about 40 ft., were broken off by the wind in 1843. —*Jas. Babbage.*

Grafting Pelargoniums.—M. D. Méline, of the botanic garden, at Dijon, has been very successful in grafting numerous varieties of Pelargoniums on the same plant. This was done in order to possess many varieties in small space. The mode of cleft-grafting was adopted, the parts fitted together being of equal thickness, bound with wool, and shaded under glass for a week. On one plant 10 grafts were found all well united in the course of 15 days. A Pelargonium elegans was selected for the stock on account of its vigorous growth. The grafts were put on in 1837; and in 1842 they were still in a thriving condition, their junction with the stock being then scarcely perceptible.—*Revue Horticole for Sept.*, 1843. ‖ [The same thing has been done in this country by Mr. Ansell.]

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Where large collections of house-plants are cultivated, repotting takes place every month in the year; but from this time till August is the principal period for this work in a general way. Many plants may now be safely repotted; early in spring the rule of seeing the roots growing freely is the best guide for beginners. Many plants will begin to grow at the top before their roots are in action; yet they do not require to be re-potted; they are either too much confined, or under a higher temperature than they require at this time. Orchidaceæ from the more temperate regions are often much injured by a high temperature when they begin to grow. The heat of the stoves should not exceed 60° by night; indeed 55° is sufficient till all the plants are in full growth.

Conservatory.—Epacrises, Heaths, and others of the more hardy plants in or coming into flower, should be kept near the sources of ventilation; while Roses and other forced flowers fresh from the forcing pits require the warmest part of the house, and ought to be kept free from currents of cold air at first. This is a good time to take memoranda of the best varieties of forced bulbs, especially Hyacinths and Tulips. The nights are still too long to allow any syringing in the afternoons; but such plants as are not in flower, and all vacant spaces in the house, should be sprinkled two or three times a week, and this should be performed early in the day.

Greenhouse.—The plants here may now have a slight syringing in the afternoon, and air may be freely admitted on all fine nights. Some young plants may want repotting. If some are growing freely at the top, and the roots not in action, the house is too hot for them, and you must remove such plants to a cooler place. Attend to neatness in all the houses, and make it a rule never to pass a pot plant through your hands without removing all yellow or injured leaves, if there are any on it; also insects, or weeds growing in the pot.

Forcing-pit.—This is a good time for propagating many plants by cuttings, by grafting, and by seeds; and the forcing-pits are the best places for this work. Seedlings already up ought to be potted off as soon as they can be safely handled. Foreign seeds had better be sown in 32-pots, putting four or more kinds into one pot, and placing labels in the middle facing the different seeds. Less water will thus be needed than if each kind was sown in a small pot; and the less water given to doubtful seeds the better chance they will have to germinate. Let every shelf and corner of these useful pits be filled with plants as others in flower are removed from them.—*D. B.*

III.—FLORISTS' FLOWERS.

Auriculas may be kept moderately moist. If not top-dressed as before directed, let them be done immediately. We are trying Potter's Liquid Guano as a stimulant, and shall report the result.

Polyanthuses.—Look well, after the late severe weather. As spring advances, the snails get proportionably troublesome; diligence must be used in trapping them.

Ranunculuses.—Plant without delay. Seed must also be sown—though I prefer autumnal sowing, where there is an opportunity of protecting during winter. Frames covered with calico prepared with Whitney's or some other similar composition, will, I doubt not, afford great facilities in the way of preservation in severe weather. The compost necessary is leaf-mould and loam, equal parts, which has been previously exposed to the action of heat, to destroy insects, eggs, &c., contained therein. Boxes about 18 inches by 12, and 6 deep, are most convenient. Fill with compost, and water it well; sow the next day, cover with very fine soil, *lightly*, for if too deep the seed will not appear. After sowing, it must be protected from heavy rains and frost; a cold frame is perhaps the best situation.

Carnations.—Should any soil have lodged in the axils of the leaves it is imperatively necessary that it should be removed; a quill, with the feather stripped off on one side, and cut half off on the other, makes a simple but effectual brush to perform this operation, and by timely looking through the stock disease may be prevented. Planting time is now rapidly drawing on; exhibitors who have not strengthened their weak or deficient classes in the autumn should now look out for the sorts wanted, if they mean to get first prizes or silver cups.

Pinks.—We should much like to see these highly fragrant flowers more extensively cultivated; beds may yet be planted, but the flowers do not usually lace so well as those planted in September.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—If in arranging the Pines, the plants for fruiting during May and June, can be put into a separate pit or compartment, they may be kept at a temperature of 60° by night, and 70° by day, which will be sufficient for the present. Be careful that the bottom-heat does not exceed 85°, lest they start into fruit too soon. Syringe the plants now in fruit, shutting up with sun-heat, which you may do with a temperature of 85° to 90°. Shade the plants lately potted, the larger successions when at 80° of sun-heat, and the young at 70°, till they have made a fresh start. A moist atmosphere will now be indispensable. Crowns and suckers growing in the tan should now be potted if strong; but if weak, and you want to keep them, let them remain in the tan a few months longer.

Vinery.—The Grapes on the Vines started in November will now require their final thinning, if not already done; thin them well that the berries may be fine, and ripen regular. It is difficult to give directions as to the number of branches to be left to each rafter, as the sort of Vine, age, condition as to healthiness and vigour, require to be taken into consideration. A moderately good crop for early-forced Vines, would be about 12 or 16 good bunches to a rafter of 15 feet. Where the Muscat of Alexandria and other good keeping sorts of Grapes, are in a house by themselves, and the house not used for Pines, it would improve them in flavour, and they would be in a better condition for keeping through the next winter, if they were started earlier than the late-house generally is. I would recommend starting them now, and give them plenty of time to ripen. Where they are grown over Pines, keep them cool till they break by the natural heat of the atmosphere, when they will bear, with less injury, the heat necessary for the Pines.

Peach-house.—Peach-trees require a great deal of water during their season of growth, and particularly while the fruit is swelling, apply it in a tepid state. In regulating the young shoots, do not get into the common error of laying in too many. Stop those shoots that are growing too strong, when about six inches in length, and repeat this frequently through the season, that the weaker shoots may be benefited by it.

Fig-house.—If any of the trees have failed to produce fruit in the early house, and the cause appears to be an over-vigorous state of the tree, which is very often the case, root prune them now, and you may have a good crop in the autumn. No plant does better from root-pruning than the Fig, and the operation may be performed at any season, if dull weather is chosen. The shoots will be shorter, and better ripened after it, and a crop is almost certain.

Strawberries.—The plants in pits and frames may be removed to the shelves, near the glass in a Vinery or Peach-house,

soon as the fruit is set, and their places filled with succession plants. Place pans under the pots on shelves, as they suffer much if allowed to become dry.

Melons.—Those who have wide pits should grow the Persian and the new Cabul Melons, as they are very superior in flavour, and bear freely. They should be planted out in front of the pit, and need not be stopped like other Melon plants; train the leading shoot up under the centre of the lights, and the laterals from each side at right angles.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Fruit-trees, Currants, &c.—Take every favourable opportunity to finish pruning, nailing, and washing or painting, all sorts, with the exception of Peaches and Apricots

Onions.—If a quantity of the autumn-sown are transplanted properly, better bulbs will be procured than from those left where sown where there is a deficiency of these, sow in a slight hotbed, more especially where young Onions are in demand for salads.

Potatoes.—Throw up some ground in ridges in a warm situation, two feet apart, to be ready for planting when fine dry weather sets in. The Ash-leaved Kidney is the most general favourite. To keep it healthy and vigorous, expose a quantity of the tubers from an early crop before they are ripe, to the sun and weather, until they become quite green, and there will be no complaint of weakness, curl, &c Failures often proceed from the tubers being too ripe, and from being heated in pits, &c.

Mushrooms.—Attend to beds in a bearing state. Allow no spawn to run into the covering material, or along the surface of the bed. If, from examination, you find the bed getting dry, pour water into holes made every eight inches with a small pointed stick; though you may have plenty of spawn in the centre of the bed, yet if it is too dry, or has to come through a considerable thickness of material which is too wet, you will obtain but few Mushrooms. In making fresh beds, if you find the material too wet, before inserting the spawn, wrap each piece in a handful of dry litter. If you are fortunate enough to get the material too dry at this season, after inserting the spawn, slightly damp the bed and cover with a coating of cow dung quite wet. The principle aimed at in both cases is similar—the insuring a fit material for the spawn to work in, and the surrounding that material with a rich moist substance, to give the Mushrooms flesh and consistence.

Routine.—Turn up all spare ground, protect frames and pits as heretofore.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—The works previously recommended should be proceeded with at all convenient times.

Coppice.—In some Coppices there are very old stools, from 1 to 2 or 3 feet high, from previous cutting. It would be of very great benefit to cut such stools off close by the surface with a saw or axe, making the cut with a gentle slope upwards, from one or both sides, according to the size of the stool. I have seen neglected Coppices wonderfully improved by this method.

Young Plantations.—Continue to proceed with thinning and training the young trees, filling up vacancies with young plants where any have failed, and planting Evergreens and some other things, such as Beech or Hornbeam, which retain their leaves through the winter, to be headed off, and kept as shrubs, in Plantations where a permanent undergrowth is required, and not designed for Coppice. Repair the fences, and proceed with all other necessary work, go over Plantations made in the autumn, and firm the soil about all small plants that have been lifted up by frost or loosened by wind. Do this as soon as the danger of severe frost is over, performing the operation when the ground is moderately dry, before drying winds prevail or the sun becomes powerful.

Hedge rows.—The making and repairing of fences and planting trees should be completed as soon as possible. But hedges, like most trees and shrubs, make more vigorous shoots if they are cut after the sap is fairly in motion.

Nursery Work.—All young plants, either in the seed-beds or in rows, that are to be removed this season for planting out permanently, or to be placed in rows for future planting, should be taken up and laid in by the heels in well pulverised soil before the sap gets in motion. Proceed with all possible haste to finish all planting for this season, especially in dry ground and early localities, in cold wet bleak situations there need be no great hurry, for plants generally succeed better in such situations when they are planted after the frosty weather is over. About this time also, any cuttings or seedlings, that were planted in autumn or early in winter, having been upheaved by the frost, should be pressed down and made fast before the sun gets powerful. In dry ground and warm situations Acorns should be sown, if not done in the autumn; also other nuts, kernels, stones, berries, and seeds of the hardiest kinds. You may still plant cuttings of some tree-growing kinds that can be increased by this method; but it would have been better to have had this done in autumn. —*W. B.*

VII.—COTTAGERS' GARDENS.

Pelargoniums that are growing rapidly may now be repotted, the tops of the young shoots should be pinched off, to induce them to throw out laterals, so as to render them dwarf and bushy. Old pots of Musk may also be knocked out, and repotted in fresh soil, using rich, rather stiff loam for the purpose; a few of the old roots that will be found on the outside of the old ball should be placed regularly over the surface of the pot, and covered about half-an-inch deep, leaving room for water, which must be given freely when the plants begin to grow. If a few forward patches of Crocuses, Van Thol Tulips, or Anemones, in the border, are taken up about this time and carefully potted, without much disturbing the roots, they will flower beautifully, and make the window gay with showy blossoms. Hyacinths in glasses will now be showing flower, and must be carefully attended to during this changeable weather. Instead of growing these in glasses from the beginning, I would prefer raising them in pots in the usual way until the flowers begin to show colour, when the bulb may be gently shaken from the soil; the roots, being washed in lukewarm water, may be placed in glasses filled with water of the same temperature. By this method I have seen them flower as strong and well as if they had never been moved, and it prevents the flowers from being drawn, the bulbs from rotting, or the roots decaying, as often happens when they are grown in water from the commencement.

Vegetables.—As soon as the weather is favourable, a small sowing of Peas and Beans may be made; and as the busy season is at hand, everything that can now be done should be got forward against that time. Ground intended for Onions and Carrots may be pointed over, and well-broken; alterations and improvements (if any around the cottage should be proceeded with.

Fruit.—If any fruit-trees remain to be pruned, they should be finished now; the Grape Vine especially, if not cut in autumn, must not be delayed.

Flowers.—When the weather will permit, edgings of various kinds may be planted, such as Box, Thrift, Daisies, London Pride, or Gentianella. But while it continues cold, care must be taken of anything liable to be injured by frost.—*M'H.*

State of the Weather near London for the week ending Feb. 22, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3*d.* each copy. It may be ordered of all booksellers. Gentlemen wishing to *distribute copies* among their cottage tenantry, may have them *delivered in any part of London*, by remitting a post-office order to this office, at the rate of 25*s.* for every 25 copies.

COMMUNICATIONS from the following **CORRESPONDENTS** are in type, and are only waiting till room can be found for them:—*J. L. Snow, A Subscriber, W. B. Booth, O., Vitis, J. Wighton, A Practical Man, Peter Mackenzie, G. Thompson, W. Billington, M. G., J. B. K. L., R. Errington, Gr., J. M'L., M. J. Berkeley.*

OUR CORRESPONDENTS will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

A CORRESPONDENT apologises for asking his questions in so brief a form as to approach a tone of impudence, and says that it is only in order to save us the trouble of reading what is needless. We can assure him that we are much obliged to him, and heartily pray that others would follow his example.

BOOKS.—*H.C.M.*—The article Botany, published by the Society for the Diffusion of Useful Knowledge, will not cost more than the sum you name.——*Amateur*.—Lindley's Theory of Horticulture.——*Subscriber*.—Loudon's Suburban Horticulturist. ——*Ofillus*.—Rogers' Vegetable Cultivator is a useful book. Loudon's Suburban Horticulturist furnishes a full account of vegetables and their cultivation.‡——[=]—Rogers' Vegetable Cultivator and Loudon's Suburban Gardener.‡

CAPE HEATHS.—*W. I.*—All Ericas are pretty; the following are good, and may be easily procured: viz. Hartnelli, pink; Aristata major, red; Acuminata longiflora, purple; Tenuiflora, white, with pink shade; Inflata, white; Archeriana, scarlet; Depressa, yellow; Elegans, light-purple; Cavendishii, yellow; Mutabilis, light purple; Retorta major, pink; Lamberti rosea, flesh-coloured; Hyemalis, purple, tipped with white; Tricolor, red; Linnæoides superba, purple, with white tip, and all the varieties of Ventricosa. ‡

CATERPILLARS.—*Cartmel*.—The most effectual mode of preventing the ravages of the large caterpillar which attacks Apple-trees is to cut off those twigs on which the eggs can be seen in winter in broad rings. Such as escape observation at this period may be detected when the brood is hatched, and before the insects begin to scatter over the tree. Whilst in groups, and when so high as to be difficult to reach, some find it best actually to shoot them, charging with gunpowder only. But if your pest is the small green caterpillar, which rolls itself up in the leaves, picking would be an endless task. Syringing with ammoniacal liquor diluted with ten parts of water will be proper to apply occasionally with an engine or a syringe. It will do the trees good, besides being repulsive to insects, to many kinds of which, in certain stages of their existence, it will certainly prove destructive. ‖

CLIMBERS.—*W. J.*—We recommend you to plant the following against your wall: Wistaria sinensis, Clematis azurea grandiflora, C. Sieboldii, and C. Viticella; Jasminum revolutum, Magnolia grandiflora and conspicua; Bignonia radicans, and Caprifolium gratum. We cannot name seeds, and we never give prices, which is the business of advertisers.‡

COUVE TRONCHONDA.—*F. D.*—This is an open Cabbage which has been introduced many years ago into English gardens from Portugal, and which has been found to be an excellent vegetable. It has a short stem and close leaves, with very thick ribs. It is not hardy; its seeds may be sown with advantage in March, or if sown in August, the plants should be transplanted into a frame in September and treated during the winter like Cauliflower plants. ‡

CRICKET-GROUND.—*A Cricketer*.—Fill up the cracks in your ground with fine soil well mixed with one-sixth of guano; and a week after rain has fallen on it, sow Crested Dogstail and Sheeps' Fescue grasses in equal quantities. If the grass is in bad order, a topdressing of soil as aforesaid will do it much good. Do not use hay-seeds, because they bring weeds.

CUCUMBERS.—*A. Z.*—A description of Mr. Mills' Cucumber-pit is given in his treatise on the Cucumber, &c, and we have no right to publish it. Two good Cucumbers for a frame are the Southgate and Syon House; the former is excellent for early use. Two others may be Mills' Frame and Allen's Victory of Suffolk.‡——*Ofillus*—The Early Frame or the Early Southgate are suitable kinds to begin operations for a frame with. An account of Couve Tronchonda is given above. ‡

DOMESTIC YEAST.—*J. D.*—We gave the receipt at p. 70, on the authority of the correspondent at Hillsborough. We, however, like you, cannot discover that the preparation has any of the properties of yeast. A ready means of making yeast would be extremely useful.

FRUIT TREES.—*Eileannach*.—In order to prevent your Fruit trees from running so much to wood, you may, as you propose, root-prune them by cutting a trench 18 inches wide, about four and a half or five feet from the wall, down to the gravel, which is nearly two feet deep from the surface of the ground, smoothing the mutilated ends of the roots with a sharp knife. This trench may be then filled up again with fresh soil from an old dry pasture. This operation will check the over-luxuriance of the trees, and tend to the formation of flower-buds. The ground should never be dug within at least four feet of the stem; but the surface of the soil should be frequently broken with a fork, and, therefore, your plan of spreading gravel four inches deep along the surface of the border will not answer. The distance of four feet from the wall is too small a space to confine the roots of fruit-trees of any size in; they should at least have six feet of a border.‡——*Cartmel*.—Root-pruning need not be repeated during three years at least. Autumn is the best time to perform the operation. Guano may be applied to fruit-trees at the rate of 4 cwt. per acre; and best in a liquid state, early in spring ‖

FUCHSIAS.—*A Subscriber, Milton*.—Epp's Kentish Bride and Bridegroom, Standish's Colossus and Attractor, Miller's Constellation, Smith's Queen Victoria, robusta, reflexa, splendens, Paragon, Formosa elegans, Conspicua arborea, and Venus victrix. Turfy peat, loam with a little leaf-mould and a small quantity of silver sand is the proper compost for Fuchsias. We have not heard of charcoal being tried, but we have no doubt of its agreeing with this tribe.*

HEATING.—*A Novice*.—A stove is useless for the purpose you describe. It will be much better to build a flue at once; but nothing will really answer your purpose as a substitute for stable litter, except hot-water gutters An Arnott stove will be expensive, and will not be of service in your case.——*Horndean*.—There is no object in bringing steam "nearer its work." Once admitted into the atmosphere of the Vinery, it will diffuse itself abundantly, if there is a sufficient supply, as seems to be the case, in your apparatus; 6-inch openings are abundantly large to admit it by. Make the gutters 6 inches deep, and place 9 inches of coarse cinders upon them, in which plunge your propagating-pots.——*T. A. N.*—The flues buried in sand and filled in at the sides, will give the most steady and durable heat to sawdust, which, however, is a very bad material, and far inferior to common cinders; but it will probably prove too dry. From 70° to 80° is the best temperature of the plunging material in a hot-bed; but it is needlessly high for Roses, which will not bear 80° to 90° without running into weak wood; for them 50° is sufficient, and such air-heat as we find on an average in a warm day in May. Roses are ruined by excessive stimulus, where forced.

HEDGES.—*Muiryfold*.—Of your young hedge there should not be more of the young wood cut the first season than what is supposed the frost would destroy during winter. The same method should be followed the second year also, excepting perhaps some of the strongest shoots, which may be lopped to the level of the others. By the time the hedge is three years' old, it may be dressed on the sides, so as to make it straight, but nothing more should be taken off the top shoots until it has arrived at the permanent height. You may cut your Beech-hedge now; the height may be about 3½ feet.‡

INSECTS.—*J. F. B.*—We are unable to advise you regarding the Peach-trees, as it is impossible to ascertain from your communication what insect it is that does the mischief; but if you will transmit us specimens with the buds or leaves, as soon as the trees are attacked, we may be able to suggest a remedy. *R.*

LILIES.—*J. M.*—The real Lilium lancifolium is not known to be in Europe; of L. speciosum there are several varieties, one of which is called Eximium. The L. lancifolium of gardens is the same as L. speciosum. You had better write to Mr. Towers; we cannot find room for your observations.

MANURES.—*A Beginner*.—Sulphate of ammonia is employed as a topdressing for grass land in March, at the rate of 2 or 3 cwt. per acre.——*J. P.*—We never saw woollen rags used for Potatoes, but presume they are chopped into pieces about an inch square.——*Ofillus*.—We should try Potter's guano for both garden and meadow.——*A Subscriber*.—Soot is a good material in its way, but either superphosphate of lime or Potter's guano, or Peruvian guano, are a thousand times better.——*Tyro*.—Either Potter's or Peruvian guano will answer your purpose. Use them dissolved in water.——*Winton*.—Give a wine-glassful of superphosphate of lime to each pot in which your Pelargoniums are to flower. Apply it as a topdressing only.

MEALY BUG.—*A Subscriber*.—In order to destroy this, when the leaves are fallen, carefully rub off from your Vines all the rough exterior bark, using a stiff brush where required to get into the angles of the branches. Then wash the Vine with strong soap-suds; or if you do not mind appearances, you may cover them with whitewash, which will do as well. This operation will remove the greater part, if not the whole of the insects which may remain on your Vines.‡

MELONS.—A correspondent inquires which is the best Melon for preserving? Will any of our readers oblige us with an answer? ‡

NAMES OF FRUITS.—*C. H. C.*—No. 1, Catillac; 221, Bergamotte de Hollande; 155, Gilogil; 224, Virgouleuse; 276, Echasserie.‡

NAMES OF PLANTS.—*Tropical*.—4. Hedyosmum nutans. 7 and 8. Species of Eugenia. 9. Some Convolvulaceous plant. We regret our inability to give you further information; but it is impossible to name tropical, or indeed most plants, when only in leaf, without an amount of inquiry which we are sure you would not wish us to undertake.

ONIONS.—*A Subscriber*.—Guano is an excellent manure for Onions. To your bed 20 yards long and 4 feet wide, you may apply 25 lbs., being about at the rate of 4 cwt. to an acre, which is quite sufficient for garden purposes. It being of a hot burning nature, must be well mixed with six or seven times its bulk of good light soil. The Onions may be sown in drills about nine or ten inches apart, drawn lengthwise in the bed. In this way they are more easily kept clean than when they are sown broadcast.‡——*Muiryfold*.—Presuming that your ground has been rough dug in autumn, and duly exposed to the action of the weather when it is sufficiently dry, you may point over the surface slightly with a spade, breaking it well as you proceed. Sow in drills, as directed above, on the first fine day after the beginning of March, if the ground is in a fit state for the reception of the seed. ‡

PELARGONIUMS.—*A Beginner*.—These may be shifted now with advantage. A mixture of two parts turfy loam to one of well-decomposed cow-manure, not less than three years old, with a small portion of silver sand, will be found a suitable compost for blooming them in.‡

PRUNING.—*Semirusticus*. — Prune Common Laurels, and all those which are rather tender, just when the buds are swelling in spring. Such as are quite hardy may be pruned at any time during winter.

RASPBERRY.—*T. P.*—We are unable to find anywhere an analysis of the ashes of this plant.

SALT OF THE EARTH.—I beg to inform "N. H. Gritton" that the words, "Salt of the Earth" were quoted from a sermon, an old sermon, but a famous sermon—the Sermon on the Mount. *P.M.*

THE OLIVE.—*F. W. C.*—See p. 54, 1843. It is absurd to suppose that a tree can improve the soil in which it grows. The efflorescence seems to be nitrate of lime.

VINES.—*R. W.*—The check which takes place at the extremities of your Vine shoots after the latter have grown from 6 to 12 feet in length, is probably occasioned by a want of sufficient moisture at the roots.‖——*A Subscriber*.—Having commenced forcing your Vines at the temperature of 50°, increase to 60°, and when the leaves expand, 65° to 70°; when setting, 75° to 80° will not be too much.‖

MISCELLANEOUS.—*A.B.*—There is but one variety of Camellia reticulata. But that is apt to have white leaves without getting out of health. Warmth prevents it. *C.*—Loudon is right. But Deodars do not require a moist subsoil. Cedars will succeed better in a soil less dry, even with a subsoil of clayey loam. The Araucaria imbricata seems to like light land. We doubt if it will succeed in clay or damp places. The tops and sides of hills are its favourite haunts. It is an ugly tree when old. You will find your question about other Firs answered in former papers on Coniferæ in this Journal. P. Pallasiana is the same as P. Taurica. We doubt whether you can get any except grafted plants of P. Sabiniana and Coulteri. We cannot answer the question about Pinus mitis, and never give prices. *An Amateur Florist*.—We never recommend nurserymen.‡ *A Young Gardener* will find excellent information on the night temperature of Vineries given at p. 459, 1843. *Vigil*.—No evergreen grows faster than Furze or Broom, or, if you want a tree, than the Common Laurel. The Huntingdon Elm is one of the fastest growers, but the Cœrulean Willow beats it, and so does Sir Charles Wager's Maple. Acer macrophyllum is quite hardy; it grows about as fast as the latter. The fastest growing Pine is the Laricio.——*Tyro*.—The black Spanish Onion. Use for them charcoal and superphosphate of lime. ——*Z.*—We do not understand your objection. We use less small type than ever. Any *fine* sand that is free from iron or salt will do; coarse sand is thought not to answer the purpose. We believe common coke, which contains much sulphur, is injurious to copper boilers. ——[=]—A span-roofed house or pit running north and south is suitable for a propagating-house. ‡——*Alpha*.—Aponogeton distachyon is, or was, naturalised in the water in the Botanic Garden, Edinburgh; but we have not seen it here in the south.——*A Subscriber*.—No. 1 is out of print; 10 may be had by enclosing six postage-stamps. *J. W. J.*—Answered p. 104. ——*A. Duncan*.—The *True Sun* ceased about five years back.

*** As usual, many communications have been received too late.

ERRATUM.—In Mr. CATTELL'S advertisement last week, for *Standard and Dwarf Pansies* read *Standard and Dwarf Roses*.

EXAMPLE FARM.

WANTED, to Rent on Lease, for a term of not less than 21 Years, to enter at Lady-day, a Commodious Dwelling-house, and about 120 acres of Arable Land, for the purpose of forming it into an EXAMPLE FARM. It must be near to a Railway station, and within 50 miles of London; on the greensand formation, under the chalk, or on the London clay or plastic clay above the chalk.—Apply to Mr. Morton, Chesterhill, Stroud.

AGRICULTURE.—A Gentleman occupying a Farm of 600 acres, of various descriptions of soil, pleasantly situated in the highly cultivated county of Norfolk, and within five miles distance of three of its market Towns, is desirous of taking one or two YOUNG MEN, to learn the practice of Agriculture. The parties would in all respects be treated as members of the family, and would have the opportunity of regularly attending Norwich market (decidedly the largest and most celebrated provincial stock market in England,) and also the advantage of becoming acquainted with the most approved specimens of Agricultural Implements and Machinery. References given and required. Address, J. D., Post Office, Norwich.

The Agricultural Gazette.

SATURDAY, FEBRUARY 24, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, Feb. 28	Agricultural Society of England.
Thursday, Feb. 29	Agric. Imp. Society of Ireland.
Wednesday, Mar. 6	Agricultural Society of England. / Highland and Agric. Society.
Thursday, Mar. 7	Agric. Imp. Society of Ireland.

FARMERS' CLUBS.

Feb. 26	Chepstow. / Fairford.	Feb 27	Bromsgrove.
		Feb. 29	Richmondshire.
March 1	Hadleigh. / Wrentham. / Debenham.	March 2	Cullumpton. / Cardiff / Gloster.
March 4	W. Market. / Yoxford. / Wenlock. / West Hereford.	March 5	Framlingham. / Rayleigh. / Collingham.
		March 6	Harleston.

THE present is THE PROPER SEASON FOR PLANTING BEANS. There are many ways of cultivating this plant. The seed is by some sown broadcast; by others it is hoed in or drilled, and by many it is dibbled. During the growth of the plant the land is in some districts flat-hoed merely; in others, it is horse-hoed and cultivated as when carrying a fallow-crop, and in many instances it is neglected altogether; and this variety of management is equally conspicuous in the treatment of the crop at harvest. We have seen Beans, sown broadcast upon land which had just been ploughed, present on coming up all the appearance of having been drilled; and in this case, the furrows being about 10 inches wide, the advantages in the cleaning of the land, which are afforded by narrow drilling, were cheaply obtained. The regular distribution, however, of the seed, with all the advantages following from it to the crop and to the land, which are obtained by drilling, hoeing, and dibbling, render these plans in every case preferable to that of sowing Beans broadcast.

The first of these methods is the cheapest. Beans are drilled in at all distances from 10 to 26 inches. In the former case, the land can only be cleaned by hand-hoeing—in the latter, it can be cultivated in every respect as during a fallow-crop; and in cases where the Bean-crop is made preparatory for that of Wheat, this is an especial advantage. In the latter case, which is general in Scotland, the land is manured in drills 27 inches wide, the seed having been previously sown in them by a hand-barrow used for the purpose; the ridges are then split by the double mould-board plough, the seed and the dung being thus covered together. Before the plants are up, the land is harrowed, the ridges formed by the double mould-board plough being thus in a measure obliterated. The plants, when up, are pared, *i. e.* a small plough is sent down each side of the row, throwing the earth from it into the intervals between the rows. These intervals are horse-hoed and hand-hoed, and after a while the double mould-board plough is again put in requisition—the plants are earthed up and left till harvest time. In drilling Beans, four or five bushels are sown per acre. In some districts Beans are drilled by the Bean-barrow in a simpler manner than that just described, this implement being sent down every third furrow as the ploughs are at work in the field. The furrow slices being 10 inches wide, it is evident the plants will come up in rows 30 inches wide.

The operation of hoeing in Beans costs about 6*s.*, and requires four bushels of seed, per acre. The seed is planted across the ridges in rows, about nine inches apart; the labourer, in the act of making each trench with his hoe fills the one already made, in which he has scattered a quantity of seed. Beans are dibbled in two ways; in the one, the unharrowed furrow slice is the labourer's guide, and two or three seeds are put into each of the holes, which are made about 10 inches asunder in the alternate furrows; in the other, the land is harrowed down, and two lines are employed as a guide for the labourer. These lines are placed about 18 inches apart, generally across the ridges, and the labourer facing them, manages both at once. He makes in succession four holes about 10 inches asunder, in the near row, putting about a couple of Beans into each as it is made, and after doing the same in the far row, he moves sidewards up the line, and repeats the operation. The holes are filled in by a subsequent harrowing. Two, or at the most, three bushels of seed are thus planted, and about 5*s.* an acre are paid for the work. Formerly, the operation used frequently to be paid for by the bushel sown, the sum being 20*d.* or so, but this unreasonable method of payment is being dropped now—it acted as a premium upon carelessness and dishonesty.

The Bean prefers land such as that affected by Wheat—a stiff loam suits it well. Many kinds of Bean are sown, but they are all, botanically speaking, varieties of one species. The Mazagan, long-podded, and Heligoland, are among the rarer kinds cultivated in fields; the most common being the Horse and the Tick Bean, of which the latter is the more prolific and superior in quality, and the former the more hardy.*

THE following are remarks upon the subject of SPADE-HUSBANDRY, by the late Rev. W. L. Rham, who contributed so many valuable articles on Agricultural subjects to the *Gardeners' Chronicle*. We insert them here, because, without determining whether or not in some cases *the farmer* can profitably cultivate land wholly by manual labour, there cannot be a doubt that he would be greatly benefited by a more frequent use of the spade, not as a substitute for the plough, but as an assistant to it; and the following remarks are well calculated to recommend such an employment of manual labour:—

At times such as that which, we hope, has now passed, when there is a stagnation in trade, and when men able and willing to work cannot find sufficient employment to maintain themselves and their families, there is an outcry raised against all those contrivances by which manual labour is diminished. Spade-husbandry is naturally looked to as a palliative, if not a remedy; and many calculations are made to prove, that by substituting the spade for the plough, the produce of the land will be so much increased, as fully to repay the expense of the additional labour. There is no denying the truth of many of these calculations, and if we have any doubts, we need only some fine day take the steamer to Antwerp, go down the Scheldt to Tanisse, or any village in the Waes country, and judge with our eyes of the success of Spade-husbandry. We may return within the week perfectly convinced, however incredulous we were before. The Spade-husbandry there enables an active industrious man to cultivate from six to ten acres of light land; to pay a high rent for it; to maintain his family comfortably, and often to lay by a sum of money to set up a son with, or give a portion to a daughter, if not to buy a piece of land for his own occupation and that of his children after him.

This is a pleasing picture and a true one; why not, then, introduce it in England? To a certain extent it might answer; a hard-working, sober, industrious family, where every individual from the old grandmother to the child, just out of its infancy contributes something in the shape of labour to the common stock—where they are content to live on coarse bread and skim-milk, or butter-milk soup, where the men are at work before the sun is risen, and after the evening twilight; such a family might live on the produce of a few acres of land, and be happy and contented; but would this suit the English labourer? Ten hours' work is a long day for him; he is accustomed to have some bacon at least with his white bread, and a pint of ale is no extravagance after the day's work is over. His wife has her children to nurse and attend to. His boys and girls go to school to fit them for something better than mere daily labour. In short, he lives like a gentleman when compared to the foreign labourer. Do we regret this, or find fault? Certainly not. Would that every labourer could always command these comforts, besides that of a clean neat cottage and well-kept garden! Spade-husbandry—that is, digging the land instead of ploughing it—will not afford this; but it may be accomplished by the union of machines to abridge labour, and the application of a better system of tillage, in which much more manual labour is employed. Instead of wearing out the strength of a man by making him turn up a hard and compact soil, why not do this by the brute force of horses or oxen while the man is set to work where his dexterity and ingenuity may be exercised, and where he can do what neither horses nor implements can do so well. We do not allude to draining, however useful and profitable an operation on all stiff cold soils; for, in time, it is to be hoped all wet soils will have been laid dry, and little labour will be required to keep the old drains in order; but when the land has been ploughed once, or oftener, is it already in the best state for cherishing the seed and nursing the young plant? If it has been richly manured, is it so free from all useless weeds that the crop will suffer no diminution from their presence? Or is it imagined that in the large fields of the farmer there is no use for constant manual labour when it has been ploughed, cross-ploughed, subsoil-ploughed, scarified, rolled, and harrowed, and after the seed has been sown or drilled regularly? If so, we will invite the most experienced farmer to walk over his own fields, to see the state of the surface, to examine the depth at which one seed has been harrowed in, while another is scarcely covered with earth, so that the first bird which passes by readily discovers and preys upon it. We will take him along the furrows which separate the lands, or stitches, as they are called. If the soil is heavy, how many clods are lying there which will impede the course of the waters in heavy rains; if it is loose, how many places are there where the soil has slipped more or less, leaving some of the seed bare which it should have covered! How much attention and light labour might be applied here, which would suit women and children, without fatiguing them!

There is the operation of dibbling the seed in one season, of hoeing the crops in another, of forking-up land which has been ploughed, to break the clods, to let out the small seeds imprisoned in them, to destroy those which have just sprung up; in short, to make a field resemble a garden. If it be objected, that the crops will never repay the outlay, we maintain the contrary. If it has been clearly shown by experience that even the slow and laborious process of digging the ground is fully repaid by the crops, is it not reasonable to expect the same result from a more perfect tillage, attended with less hard labour? There are many examples of crops of more than double the usual average on land treated in every respect as is usual in a farm, except in the greater attention to minutiæ, which are overlooked in a field, but carefully attended to in a garden. Why should not the surface of a field be gently raked when it begins to set after rain, that is, form a crust, so as to impede the growth of the young plant as it rises to the day? Why should the intervals of the stitches not be dug out, like those between seed-beds in a garden, and the earth thrown over the plants to strengthen them by the addition of fresh earth, while the deep intervals collect all the superfluous water, which might chill the roots, if not rot their fibres. Let the common field-seeds be sown carefully in a garden well covered and pressed, or trodden—the surface raked smooth, the paths between the beds kept neatly shovelled out, and who will not expect an extraordinary crop? It is well known that injudicious manuring diminishes the crop, but with improved tillage the crop is always more certain and abundant. The finest and richest soil badly tilled will produce but a moderate crop, while a naturally bad soil may be so improved by judicious tillage as to produce far more abundant crops than the richer. All that is required is a good system; we would not have men harnessed to carts, where brute strength alone is required, to draw a load; but we would set them to such work as requires judgment and dexterity. To what extent this may be applied to the operations of husbandry, experiment and observation alone can teach; but that it may be so, there is every rational probability.

That we may not be supposed to suggest impracticable improvements, let us only consider how many crops are lost, or greatly diminished, in consequence of some circumstances which affected the first shoots, and caused a retarded and consequently weakened growth. How many plants of Wheat are thrown out of the ground on light soils by the frost, which, if the seed had been deposited at a proper depth and firmly trod in, would have produced numerous stems and ears? The attention of a man directed to the state of a field might avert innumerable evils; the first appearance of blight or mildew might be watched, and correctives applied, which strict attention to the appearances would soon discover; the ravages of worms and insects might likewise be arrested as soon as discovered, and a crop, now left to take its chance, might be defended from its enemies and secured from harm. What good gardeners do with respect to fruits and vegetables, by care and attention might be readily extended to the produce of the field, and, doubtless, with the same success. A man with a spade, a hoe, and a rake, cannot fail to find ample and useful occupation in a field at all seasons; and if he is interested in the result, by a premium on any increase of crop beyond the usual average, he will well earn the wages he may receive.

Much useful labour might likewise be applied to increase the produce of the dairy. The stalling of cows at all times of the year is found decidedly more economical than the old practice of letting them roam at liberty in large pastures. Natural and artificial meadows may be cut before the flower of the Grasses expands, and afford excellent and abundant food for the cows; while women and children may be employed in eradicating all plants which are either useless as nourishment, or hurtful to the cows by giving a taste to the milk.

All these are mere suggestions worthy of a trial; but they are not vague and crude fancies, for most of them have some foundation in experience and observation. The principle we contend for is simply this: that, without adding to the more laborious part of the work, many more hands might be employed on a farm, so as amply to repay the cost, by trying to imitate the neatness and perfection of garden cultivation

* See Professor Low's "Elements of Practical Agriculture."

on a larger scale. Much may be learned by watching the cultivation of allotments of land, where these are judiciously let to industrious labourers; after their day's work you may see them carefully examining their little plots of Wheat, or any other produce, with a spud or little hoe—the weeds are picked out before they are well out of the ground—a clod on the surface, if sufficiently dry, is broken by a slight blow with the back of the hoe—a plant which appears rather loosely set in the ground is made firm by a tread of the foot; all this is very slight work, yet at harvest we see crops of seven and eight quarters of Wheat per acre on land which, in the memory of man, never produced half that quantity, and which is by no means abundantly manured. Suppose that a week's work of an able-bodied man in a Wheat-field only causes an increase of two bushels at harvest, the extra labour and attention will be paid for; but every one knows that the increase of two bushels on every acre will be considered as no great thing in a field of ten acres thus attended to; yet this increase will repay a constant unremitted attention of a man for ten weeks, giving him ample wages.

But what is the farmer the better for this? Much, in every way: his crop has been kept free from weeds; the labour for the subsequent crop is much lighter, and his land is improved in texture by all this careful tillage. If he was in the habit of fallowing his fields to clean them, he may defer this process for a longer time, if not omit it altogether. If he sows Clover or artificial Grasses, the carefully prepared surface insures their growth and saves much seed. The failure of a sowing of Clover is no trifling loss, as we all know, and an improved tillage will decidedly diminish the chances of failure. In short, where there is the wish to do good, while we benefit ourselves, and have the pecuniary means to meet some additional expense, nothing can be more strongly recommended than to apply constant and minute manual labour to the improvement of the soil, and thus to promote the certainty and beauty of the crops.

EXPERIMENTS WITH NITRATE OF SODA, &c.

(*Continued from page* 106)

I applied the three dressings as above stated, viz., 1 cwt. of nitrate of soda per acre, manganese and nitrate of soda in equal quantities, 1¼ cwt. per acre, and Guano mixed with soil, to rows of Turnips after they had received the second hoeing and begun to spread over the top of the drill. The effect as to the colour and growth of the tops was the same, and in the same proportions as on the Clover-fogg; but the final result of this experiment remains to be proved by the weight of the roots, when taken up, as compared with each other and with rows that had no top-dressing.* I applied the same dressings to Rape, sown upon bone manure, when it was about three inches high, and in this case the nitrate and mixture produced the most decided effect that I had yet seen. Within a month those rows had grown to twice the height of the rest of the field, and were covered closely over the intervals, bearing fully double the weight of produce, although about a week after being applied the leaves were spotted and blistered, probably owing to the nitrate not having been pounded sufficiently small. Those done with guano were better than the part which had nothing, but much inferior to that to which nitrate had been applied. Some sheep were put upon that part of the field on the 24th of August, and in a week had eaten the rows done with nitrate and manganese close to the ground, while those done with guano and left undone were hardly touched, a decided proof that the application of nitrate to such plants has the effect of not only increasing the quantity to a great extent, but of rendering it more palatable to animals, and I doubt not in an equal degree more nutritious. I found nitrate very beneficial to the growth of Tares, and extremely so to six acres of the second year's grass to which I applied it at the rate of 1 cwt. per acre. The effect was greater and more rapid than upon the first year's Clover; probably because being a thicker cover, the whole of the nitrate would be retained by the blades of grass; whereas in the other case, a part would fall upon the ground. This land being in pasture the increased produce could not be brought to the test of actual weight, as in hay, but the stock having been kept off it for a week after sowing the nitrate, it acquired such a growth as, in comparison with other land, to keep nearly double the quantity of sheep, or, at any rate, I am confident at the rate of five per acre instead of three. My experiments upon Corn both last year and this have been unsuccessful. The nitrate stimulated a great growth of straw. In both years a great deal of rain fell just previous to the harvest, in consequence of which those portions have been laid and much injured, producing a great bulk of coarse straw, but little grain. And even in cases where both Barley and Oats seemed in no danger of being too bulky and were not lodged, a second growth was produced, and they are now being cut full of green and immature shoots, while the good grain does not appear to be more in quantity nor so good in quality as that which had no nitrate. A rapid growth of straw with a heavy blade, just before shooting out the ear, is always attended with much risk, and as nitrate produces that effect, if applied to Corn after it has grown 12 or 15 inches from the ground, it must always be attended more or less with danger. And when applied very early, and before the plants cover the ground, it produced, in my case, no effect at all.

With respect to guano, I am sensible that the result of these experiments forms no test of its value as a manure. Being the produce, accumulated for ages on the rocky islands of the Pacific, of sea-fowl, which feed on fish, it contains a large proportion of organic matter of the richest and most stimulating kind, and ought to be applied mixed with ashes, charcoal, or some other substance, as other manures are, to the soil, so as to be accessible by the roots of the plants. I could not, however, procure any at a proper season for using it in that way, and therefore determined to try it as a top-dressing in the same way as the others.

The numerous experiments which I have made with nitrate of soda lead me to the determination in my own practice, to use it as much as possible on grass and green crops, and only on Corn in such situations as run no risk, be the weather what it may, of the crop being lodged from too great a growth of straw. I have satisfied myself that I can obtain the requisite quantity of hay upon two-thirds, or rather less, of the land which I have hitherto assigned to it by the application of nitrate of soda to the grass; so that I have one-third of the land at liberty to feed sheep. I am also satisfied that its application to pasture-land increased the produce at any rate by one-third, and to Rape, in one instance at least, by one-half; the consequence of which must be an extra production, in equal proportions, of mutton and wool, and an additional return of manure from the sheep to the land, which will produce its effect upon the succeeding crops of grain, not by stimulating a rapid growth at any peculiar stage, as nitrate does, but by entering gradually and regularly into the whole process from the germination of the seed onwards to the maturity of the crop.—*John Grey, Dilston House.*

* Dec. 6th, 1841.—The Turnips were pulled this day and carefully cleaned of tops and tap-roots, after which they were carefully weighed, under the inspection of Mr. Hunt, and the following Table shows the result:

Top dressings.	Square yards in each Portion.	Weight of Turnips in each Portion.	Weight per acre.
		st. lbs.	tons lbs.
Nitrate of soda	166 4 9ths	117 8	21 58
Manganese&nitrate	166 4 9ths	117 8	21 58
Guano	166 4-9ths	127 6	23 25
Nothing	166 4-9ths	124 10	22 166

The tops were not weighed, as their value is small, and would go a short way in altering the comparative value of the produce; but the drills to which the nitrate, and mixture of nitrate and manganese were applied, showed much more top throughout the season than the others, although in the end the roots weighed less. Whether those roots would have gone on to increase till they had overtaken the others, if they had not been checked by the unusually severe frosts which came on early in November, I do not pretend to say; but the experiment tends to confirm me in the opinion already expressed, that saline manures are more safely and efficaciously applied to green crops, such as Grass, Tares, and Rape, than to grain or the bulbous-rooted plants. On the contrary, the effect produced by the Guano is very encouraging, especially when it is considered that I did not receive it in time to apply it in the rows, as bone-dust and other manures are applied, and that comparatively but small particles of it could have found access to the plants when scattered along the tops of the drills after the Turnips were first hoed.

N.B.—The Turnips referred to above were all grown upon an ordinary dressing of foid-yard dung.

REPORT OF DR. VON MARTIUS ON GUANO.

(*Continued from page* 106).

The first chemical analysis of guano was made by Fourcroy and Vauquelin, from the specimen brought home by Baron von Humboldt. These chemists found that it consisted of at least a fourth part of uric acid, which was in combination with ammonia. They also found oxalic acid in combination with ammonia and potassa, the phosphates of ammonia, of lime, and of potassa and ammonia, and a small quantity of a fatty matter. Soon after this analysis, Klaproth made his known; and then Völkel and Vertels published a very accurate quantitative analysis. It may not be uninteresting to give the results of these analyses.

	Klaproth.	Völkel.	Vertels.
Urate of Ammonia	16	9	3.244
Oxalate of Ammonia	—	10 6	13.351
Oxalate of Lime	12.75	7.	16.360
Phosphate of Ammonia	—	6.	6 450
Phosphate of Ammonia and Magnesia	—	2.6	4.136
Sulphate of Potash	—	5.	4.227
Sulphate of Soda	—	3.8	1.119
Muriate of Ammonia	—	4.2	6 5
Phosphate of Lime	10	14.3	9.940
Phosphate of Soda	—	—	5.231
Muriate of Soda	0.5	—	0.1
Alumina	—	—	0.104
Clay and Sand	22	4.7	—
A waxy resinous substance	—	—	0.6

These analyses show considerable difference, but this may be explained by the varying age, purity, and origin of the guano. It thus appears that amongst animal manures guano clearly claims the first position. It is uncommonly rich in ammoniacal salts, and these salts act very favourably on vegetation. They abstract from the air its carbonic acid, and it is through its means that those various proximate principles are formed, such as starch, mucus, resin, lignin, &c., which constitute the body of the plant. With the exception of the oxalate and the phosphate of lime, nearly all the salts are soluble in water. The urate of ammonia is not so, but then in the atmosphere it undergoes a decomposition, by which carbonate of ammonia is formed, which is equally soluble with the rest of the salts, and is taken up by plants, and contributes very much to their nutrition.

The ease with which these salts are decomposed by the air, and rendered partly volatile, will account for the fact that plants manured with Guano generally present early in the morning, accumulations of dew on the points of their leaves. The Guano absorbs the surrounding air, and also the vapour of water that may be in it, which is especially serviceable to plants, and this is why Guano is so valuable a manure in dry, barren regions.

If we compare Guano with other excrementitious manures, we shall find it far preferable to those afforded by man or the other mammalia, which do not generally contain more than 20 per cent. of matter that can be appropriated by plants as food. It is thus five times better than night-soil, and it is also very superior to the so-called *Poudrette*, which, in the drying, loses, through putrefaction and evaporation, the greater proportion of its ammoniacal elements.

In birds, the excretion both of the kidneys and intestines are contained in the cloaca, and thus it is that the volatile elements of the one get combined with the firmer elements of the other. The Guano is also the better, from the circumstance of its being produced by sea-birds, which live entirely on fish, and eat no vegetable matter. The exposure also of the Guano to the heat of a tropical sun, as soon as deposited, prevents the volatile elements from flying off, by the formation of a hard crust upon its surface. The manure of our dove-cotes suffers a considerable loss by its exposure to the air.

In its action on vegetation, and in its chemical composition, Guano may be compared to the manure of dove-cotes. Davy found in fresh dove-cote manure, twenty-three parts soluble in water, consisting of uric acid, urate of carbonate of ammonia and common salt; but in the dried manure only eight parts in the 100 soluble. Sprengel analysed this manure, six months old, and found 16 per cent. of soluble matter; there was very little uric acid, and a great deal of carbonate, sulphate, and urinate of ammonia, with some common salt and sulphate of potash. The eighty-four parts insoluble in water, consisted of siliceous sand, phosphate of lime and magnesia, and traces of alumina, iron, and oxide of manganese.

MANX AGRICULTURE.—No III.

(*Continued from page* 58)

The spirit of emulation which prevails throughout the United Kingdom, and is extending its beneficial influence under the auspices of Agricultural Societies, has at length winged its way to the Isle of Man; and amongst the benefits which have followed in its train, must be prominently mentioned improvements in live stock, and in Agricultural implements. Owing to the peculiar situation of the island, the Manx herds of cattle are of so mixed a nature as to be almost indescribable. Specimens may be seen of the "Hereford" crossed with the remote "Guernsey," or hardy "Highland;" and of the "Holderness" or "Durham" crossed with the Polls of adjacent Galloway, or the beautiful breed of Ayrshire.

These incongruous mixtures are, however, rapidly declining, and the importation of some highly-bred short-horned bulls and heifers is producing incalculable benefit throughout the length and breadth of the island. Honourable mention must be made of the short-horned herds of Faulder of Ellerslie, Gawne of Kentraugh, Farrant of Jurby, and of the Jeffresons; nor should the pure Ayrshire dairy stock of Mrs. Miller of Ballaconyea be omitted.

The breed of sheep is also rapidly improving, and on the "bleak and barren rock" (as Mona has been ignorantly described) may be seen grazing in health, breed, and beauty, undiminished by importation here, the heavy Cotswold and New Leicester, the beautiful Southdown, and the hardy Cheviot; while the active little Manx sheep still retain undisturbed possession of the heathy mountain pastures. With reference to the implements of Agriculture, there is still great need of improvement; for, although the old wooden plough is for the most part superseded by one of iron, and the useful double mould-board is in much request, there is still great lack of those newly-invented instruments, by the use of which culture has been improved, and labour diminished, in England. Much benefit would arise from the more frequent use of scarifiers, couch-rakes, and improved horse-hoes in the tillage of the land; and of drills and dibbling machines for depositing seed corn, the greater part of which are comparatively unknown. Great excuse must, however, be made in this respect, as it would be difficult for the tenant farmer, or even the small Manx freeholder, to encounter single-handed the expense of those mechanical improvements which are so accessible to British farmers. It occurs to the writer that some such plan as the following would be alike practicable and beneficial, and may perhaps be applicable to many districts in England as well as to this island.

Let some portion of the funds of the local Agricultural Societies, or of Farmers' Clubs, be appropriated to the purchase of the more expensive and useful implements. The island might be divided into districts (and the present parochial division would be very convenient), in each of which these implements might be deposited. All subscribers to the Society should have the liberty of using them, and by an amicable arrangement no great clashing of interests need occur. A small sum should be paid for their use, sufficient to repair wear and tear, and to provide new ones. Thus would an Agricultural Society prove itself of real and practical benefit to the Manx farmer.

It has been before stated that the soil of the island is very various, and the rent of land is influenced accordingly, but it will be found to range between 1*l.* and 40*s.* per statute acre. Near the principal towns that maximum is exceeded, as accommodation land is in great demand. There are, however, no other outgoings in respect of rates, taxes, &c., except that, for each cart kept on the farm, a day's labour per annum to the high-road is expected and demanded. Tithes are adjusted as in England, leases are short in their form and intelligible in their language, and

few more stringent clauses are inserted than the reasonable prohibition from selling manure, straw, or meadow-hay—from taking two white or grain crops in succession, and a stipulation on the part of the tenant to leave a proper proportion of the arable land sown down with grass-seeds at the end of his term.—*Cultor.*

(To be continued.)

ON MINERAL AND INORGANIC MANURES. No. VIII.

By Professor Charles Sprengel.

Marl is one of those mineral substances which can easily be used as a manure on a large scale, for it is to be found in many localities, generally forming thick strata. The most barren localities are at times most wonderfully improved by it, and this is the more important for the Agriculturist, as it is to be obtained at a trifling expense. The extraordinary effects which the marling of fields has produced have induced some Agriculturists to consider it the *ne plus ultra* of all manures; they thought that it could even supersede dung. There have been put forth several theories as to the mode in which marl acts, but it would lead me too far to state them all, and it would take up still more time to refute them. I shall therefore limit myself to that one which is not only in accordance with the newest doctrines of Chemistry and Vegetable Physiology, but is also confirmed by the experiments which I have made on the manuring properties of the single component parts of marl. I shall leave it with the reader to compare my theory with the older ones; and I do not doubt, that if all be taken into account that I have previously said on the nutritive process of plants, he will find them to be irreconcileable with Nature.

If we leave clay out of the question, which can only improve the mechanical texture of the soil, the chief ingredient of marl, according to weight, is carbonate of lime, which at times amounts to 50 per cent., and more. We shall treat of it first. As lime has a great affinity to humic acid, marl will endeavour to form that acid (provided that it does not already exist), from the vegetable matter and the coal of humus in the soil; but as the lime is already combined with carbonic acid, this will in a great measure prevent it; and then its combination with humic acid is very gradual, and moreover, requires for the operation (what is not to be overlooked), the assistance of the sun's heat. When lime has combined with humic acid in the proportion of 13 to 87, it is soluble in 2000 parts of water, and is then suitable as food for plants. The carbonic acid, on the other hand, which the humic acid has displaced is received by the water, and is also absorbed by the plants. The advantage, however, which the plants derive thereby is not great, as will appear from the following calculation: Suppose 20,000 lbs. of marl, containing 30 per cent. carbonate of lime, were brought on one Magdeburg acre of land, the plants would receive thereby 2640 lbs. of carbonic acid, for 100 lbs. carbonate of lime are composed of 43.6 acid and 56.4 of lime; but it is proved by experiment that a period of 20 years is required for all the carbonate of lime of this quantity of marl to be decomposed by the humic acid and the silica of the soil; and if the quantity of carbonic acid available to the plants amounts annually to 132 lbs., this will amount to an annual supply of only 36 lbs. of carbon. What can this small quantity of carbon avail the crops? One crop of Rye (3000 lbs. of grain and straw) contains more than 1500 lbs. of carbon! If, however, the soil should not contain so much humic acid (22,486 lbs.) as would suffice for the saturation of all the lime communicated to it by the marl, in the state of carbonate, in the assumed case of 20,000 lbs. per acre; then, the lime, leaving the carbonic acid, would unite with the silica of the soil into a silicate of lime—a substance which, being insoluble in water, cannot afford any nourishment to the plants. Still, silicate of lime will always be formed along with humate of lime; partly because lime and humic acid cannot be everywhere in contact throughout the soil, partly because so much humic acid does not at any one time exist in it as is necessary to unite with all the lime. Thus, a great disadvantage results for the plants, and the effects of marl-manure will cease the sooner (at least as far as the action of carbonate of lime is concerned), the more silicate of lime has been formed, which will be chiefly the case in very fine sands. The substance thus formed will, as we have seen before, be again decomposed by the humic and carbonic acids; but this process takes place so slowly, that it will benefit the plants but very little. A larger quantity, however, of silicate of lime may be decomposed by the nitric, chloric, and sulphuric acids, which are annually conveyed by the rain to the soil; and as soluble calcareous salts are thereby formed, it may be said that the plants are thereby supplied with some scanty quantity of lime. The carbonate of lime, again, may also cause the combining of the atmospheric nitrogen and oxygen into nitric acid, which unites then with the lime, and forms lime-saltpetre; still, the quantity of the salt thus formed is probably so small, that the advantage of it to the plant can scarcely be taken into account. The chief effect therefore of the carbonate of lime in marl is, that it combines with the humic acid already existing in the soil into a salt very advantageous to vegetation, and that, on account of its great affinity for that acid, it decomposes the coal of humus and other organic matters of the soil; although this is done in a far less degree than by caustic lime—that, moreover, by this process several other substances of use to plants—as potash, nitrogen, sulphuric acid, &c.—are developed and brought into play, as has been already stated in speaking of lime.

Besides the carbonate of lime, the carbonate of magnesia also is one of the chief components of marl. Its action upon humic acid, vegetable matter, and coal of humus, is similar to that of carbonate of lime, but less powerful, as it does not contain such a strong chemical base as the latter. With humic acid the carbonate of magnesia forms a salt, which is soluble in 160 parts of water, and is useful as food for plants. The effect, therefore, of the carbonate of magnesia contained in the marl must vanish sooner than that of carbonate of lime; the more so, as magnesia will also readily combine with the silica of the soil into a silicate which is insoluble in water. It may therefore sometimes be necessary to repeat a manuring with marl merely on account of the magnesia. The carbonic acid thus expelled by the silica and humic acid is not to be taken into account at all, because if any sort of marl contained even 30 per cent. of carbonate of lime, it scarcely ever contains more than 5 per cent. of carbonate of magnesia. Everything else which has been stated of carbonate of lime refers equally to carbonate of magnesia.

(To be continued.

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. VII.

(Continued from p. 107.)

The Oleaginous Group.

Oil, fat, or wax, are contained in the cellular structure of many plants. The odour of plants depends upon the volatile oil which they contain. The fixed oils, such as olive, rape, and linseed oils, are obtained by crushing the fruit or seeds of the Olive, the Brassica, or the Flax plant. Their use is well known. All plants of the Beet tribe are rich in oil. Wax is not so easily obtained as oil; it may be procured by heat from the Poplar and other plants, and the well known manufacture of this article by bees proves its existence in plants, whence they derive the material.

A substance similar to tallow is yielded by a tree named the Croton Sebiferum, and a tree which abounds on the Malabar Coast, called Piney, bears a pulpy fruit that yields a large quantity of tallow, almost as firm as wax*.

The Oleaginous Group, as is well known, are produced in large abundance by animals. This is effected by the transposition of the elements of food; no food will produce fat that does not contain its elements. The importance of bearing this in mind by those who undertake the fattening of cattle, has been ably shown by Dr. L. Playfair, in the "Agricultural Journal." His lectures upon this subject contain an elaborate view of Liebig's doctrines and discoveries in this important branch of Chemistry.

The designed use of the Oleaginous Elementary Group in plants is evidently the support, the respiration, and animal heat of the animals that live upon the plants which contain them. Fat is not, properly so called, a part of the organism of animals. That portion of this Group which is not required to support respiration is deposited as fat in the cellular structure. *The carnivorous animals deposit no fat.*

The Albuminous Group contains the elements of food which are essential to the formation of muscle. Thus in beef, the fat is produced from the saccharine or oleaginous, and the lean from the albuminous or azotised parts of the food. The albuminous elements of food that exist in plants have an important office to fulfil in the economy of life.

From the first moment of existence to that of death, there is a continual decay of the tissues of the body in all animals. Motion cannot take place without the death of a part of the body. If a finger is moved, or a thought exercised, a particle of matter is destroyed. This can only be restored by the albuminous portion of the food. Its importance thus requires no further comment. Bread is aptly called "the staff of life." It gains its title to this character by containing flour of starch (non-azotised matter), and gluten (azotised matter), in such proportions as are exactly adapted for human food; so that a person who would die if fed upon Potatoes or Rice, or lean beef, alone, would thrive upon bread, which contains a union of the two great divisions of food.

The azotised group of the chemical constituents of plants are represented by three principles contained largely in vegetables; these are modifications of the same principles. They are fibrine, albumen, and casein.

1. Of *fibrine.*—If the juice expressed from a vegetable be allowed to stand, a green deposit will take place. When the colouring matter of this deposit is removed, a grayish-white substance will remain, which is vegetable fibrine. This vegetable fibrine is identical in chemical composition with the lean part of beef when deprived of its colouring matter. It is the principle which restores waste in the animal.

2. *Albumen.*—If we take a Turnip, or Mangold Wurtzel, or Cauliflower—crush it, strain off the juice, and subject this juice to a boiling heat, a coagulum will form, which is identical in its nature and chemical constitution with the white of egg.* This is vegetable albumen. It is fibrine in its primitive form; organised by the vital principle it becomes the fibrine of muscle, of beef, mutton, &c. The egg contains albumen and fat, with a little sulphur; and yet, from the egg, a perfect animal is produced with flesh, feathers, beak, claws, and gelatinous bones. The albumen is in this case metamorphosed into fibrine (muscle) by the vital principle. Fibrine is converted into gelatine, whence the bones, beak and claws, feathers, &c. of the perfect bird. Thus we see that in a Turnip or a grain of Wheat we have the elements from which an animal can be formed.

3. *Casein.*—From Peas and Beans, where it exists in the form of legumen, and from many other plants, a third principle can be obtained. This is Casein, which is identical with the curd of milk, from which cheese is made. Man and other mammalia are supported while young entirely by milk, which fact furnishes the only known instance where animal life is supported by one article of food. Now, in milk there are combined the essential elements of nutrition—sugar, oil (butter), which are non-azotised, and the azotised principle casein (cheese.)

It is impossible to glance at these beautiful facts, dwelt upon by Liebig and others, without being struck with the harmony and perfection evinced in the design of Infinite Wisdom.

Now, it is clear from the above statement, that if the perfect bird can be formed from the albumen and fat of the egg, the plant containing starch and gluten must be formed from matter containing the elements of starch and gluten. The analogy between the chicken and the plant does not cease with the formation of roots in the latter, and the breaking of the shell of the former. If not fed they die. Instinct and human care will support the bird. The vegetable instinct (if I may be allowed the expression), of the roots and leaves of the plants will provide for it nourishment from the air and soil. If this is deficient in the soil, or it is desired to increase the size and weight of the grain, then according to that deficiency or desire, it must be supplied in the form of manure by the ingenuity and wisdom of man.—*C. R. Bree, Stowmarket.*

Home Correspondence.

Importance of writing Plain English.—Now that your Paper, from its greater scope of objects, is likely to become of more extended circulation, I venture to suggest to you and to your correspondents, that in their communications they should avoid provincial or local terms of description, weight, measure, &c. Every locality has some *patois* of its own, which is of course better understood and much better liked there than elsewhere; but in a publication intended for general use, it is obviously necessary that none but purely English terms should be used. Only fancy what a hodge-podge the *Gardeners' Chronicle and Agricultural Gazette* would be, if each county alone were to send a specimen of its dialect—not to mention that the Welch, Irish, and Highland Scotch, might take it into their pens to address you in their tongue also! With reference to weights too, and measures both superficial and solid, the use of local denominations renders many useful communications only so many puzzles. In the market notes of prices, we have in Ireland, for instance, Wheat per bag of 20 stones, Oats per barrel of 33 stones, Barley per barrel of 36 stones in some places; while in others, the barrels are—of Barley 16 stones, of Oats 20, &c. &c. Then we have the Scotch Bolls, Firlots, &c. &c.; the Welch Peggot, and the Straw-quart. As to the weight of a stone, it varies as much in commerce as it does in geology. There cannot, in fact, be any better way of measuring Corn of all sorts than by the regular avoirdupois scale; all other modes should be abolished, as has been the case with respect to the admeasurement of coal. As to the "Muirland Gardener," who can quote from Dr. Lindley good classical English when he pleases, my sentence on him is, that if he uses any more of his reekie-peekie stuff, his horn spoon be taken from him, and he be obliged to eat his stirabout with a two-pronged fork for a month.—*Woodend.*

Effect of Winds on Vegetation.—In the *Gardeners' Chronicle* of last year, there were extracts of lectures published pointing out the analogies which exist between the process of combustion and the process of digestion in an animal's stomach. I need not say how important the analogies of nature are: they have often pioneered the way to important discoveries in science. Witness some of Sir H. Davy's discoveries. Following these analogies I have long been impressed with the belief that a current of air made to pass over vegetation promotes its vigour, in the same manner as one passing into a fire hastens combustion. Indeed, if plants appropriate a portion of the atmosphere to their sustenance in the same manner as an animal or the fire does, it is difficult to understand how currents of air, of varying density, can pass over them without affecting their health. When the wind blows we experience currents of denser volume than when the atmosphere is perfectly still. Plants, therefore, in the former case have opportunities of appropriating a greater amount of the pabulum they derive from the atmosphere than they have in the latter. These opinions, which I have long entertained, I was desirous of seeing confirmed or confuted by more extended observation, and I took the liberty of addressing a few queries to your paper upon the subject, in the hope that they would elicit some remarks from your readers respecting it. The instances of fertility to which I referred are not in upland districts. We can find exposed situations where the fertility is not impaired by want of climate. There is one within the range of my eye at the present moment; it is an eminence in the midst of a fertile plain, and, certainly, vegetation at this season is much more luxuriant upon its top than it is at the base. The shaking and stirring of plants by wind is an effect which is obvious to every one, but we do not often enough reflect that most of the operations of nature are carried on in secret, and that what we see ought only to be regarded as an indication of what we do not see.—*J. R.* [Luxuriance of vegetation on the summits of eminences greater than that occurring in vales, must generally be owing to a difference in the nature of the soil. If our correspondent would examine geologically the spot he refers to, we think he would find that its greater fertility is owing to a difference of soil, owing to a change in the nature of the subsoil on which it rests.]

The Chief Fertilising Qualities of Bones.—This is a

uestion of considerable importance to the farmers of the oils to which crushed bones are a fertilising addition, for erroneous views of its mode of action has led, through injudicious modes of application, to much disappointment and loss. That the decomposable animal matters do *not* form the *chief* fertilising ingredient of crushed bones is, I think, indicated in several practical ways. Thus the Cheshire farmers, who use the boiled or steamed bones of the Manchester size-manufacturers very extensively for their pastures, consider that for these the bones are certainly as enriching to the land, when nearly all the size and grease are removed by the process of steaming, as when the bones are in what they denominate "the green," or unboiled state—and the evidence does not conclude here :—the more skilful farmers, who use the crushed bones as an excellent drill manure for Turnips, have long since discovered that the fresh bones are not nearly so powerful as those crushed bones which have been fermented in heaps, either by themselves or with other fertilisers, until in fact the mass is reduced by the putrefactive fermentation nearly to the same appearance as garden mould. By this process it is true that the proportion of carbonate and phosphate of lime remains unaltered in the remains of the bones, but then almost all the purely animal matter is dissipated in the gaseous form. Volumes of ammoniacal matters are evolved, and yet still the farmer finds that the crops of Turnips he can produce with the fermented or nearly-decomposed bones are far superior to those grown with the unfermented. I am not aware of any very valuable experiments with calcined bones, but there are several very recent experiments, to which I need hardly refer your readers, upon the application of sulphuric acid to bones, which clearly support the same conclusion, for from these it appears that the fertilising properties of bones are certainly not impaired by this process, although by the action of the sulphuric acid on the bones, a very considerable chemical action takes place, the animal matters of the bones are decomposed, and a very large portion of their constituents are evolved in the gaseous state. It is very likely, I think, that all the reported advantages of this new mixture of sulphuric acid with bones may be obtained at much less expense to the farmer by mixing a portion of gypsum (sulphate of lime) with well-fermented crushed bones, (?) but still I cannot but consider these experiments as affording additional evidence that it is not the decomposing animal matters of the bones which furnish their chief fertilising properties, but that their agricultural value must be attributed chiefly to the copious presence of the phosphate of lime.—*Cuthbert W. Johnson.*

Shed-feeding of Sheep.—Foot-rot.—When offering a few remarks lately respecting the confinement of sheep in sheds, I felt disposed to introduce something respecting the probability of their becoming affected with the foot-rot from want of the liberty of rambling, but I abstained from doing so from the apprehension that such reference would have been considered hypercritical or visionary by your readers. Yet, as I perceive in your publication of the 3d inst., a coincidence between the notion which then occurred to me, and an alleged fact related by another of your correspondents, in the communication which succeeded mine in the same column, I take the liberty of sending you a few addenda to my former letter, suggested by the information conveyed by Mr. Grey, of Dilston. That gentleman states in substance that he had confined sheep in sheds, and occasionally with successful results; but that the advantages which he derived were overbalanced by a virulent disease in the feet, which was either the foot-rot or some modification of it. Now, sir, the experience of Mr. Grey on this subject goes farther than the point on which it directly and primarily bears, viz., the expediency of feeding sheep in sheds; for it has an important bearing also on the discussions which have taken place respecting the cause of the foot-rot. Warm moisture has been assigned as the origin of that malady, and I venture to say with good reason: moist pasturage in a warm season of the year induces evaporation that becomes noxious to sheep, from the circumstance of their lying with their feet folded under their hearts, in the manner most calculated to produce great heat and moisture, which also affects their bedding in the sheds, and generates, in Mr. Grey's opinion, an ailment similar to, if not identical with, the genuine foot-rot. Inflammation of this nature does not arise (unless infectious matter has been deposited on the pasture-ground by other sheep) in flocks that have a short dry pasturage, and sufficient liberty of range; it is on rank grass in low land, and generally moist pastures, that the foot-rot is found to exist. Sheep that have a considerable way to walk in search of their food escape this affliction, which, like the gout in the human race, is a frequent attendant on a life of sloth and voluptuousness. They may have galled feet from over-travelling, but not the foot-rot, which seems to have been the effect of the increased weight and consequent inactivity of the large varieties. I am aware that a different theory has been adopted by eminent veterinarians respecting the foot-rot—that some high authorities among them attribute it to the deformed structure of the hoof from overgrowth, through want of the friction which rough land supplies to pare it down, or the neglect of the shepherd to trim it with his knife; but I cannot conceive that the distorted form of the hoof occasions the malady in question, which appears, with far more probability, to arise from moisture under the particular combinations calculated to render it the chief agent in developing the ailment. Mr. Grey may perhaps recollect whether those of his sheep which became diseased in the feet had any deformity of structure in the hoof previously to their being confined in the sheds. I fancy that he will not attribute the effects which he witnessed to any preceding want of natural or artificial hoof paring. Neither his remarks, however, nor mine, tend in any degree to prove that sheep in actual preparation for the butcher may not be house-fed with great advantage on Mr. Childers' system, while they harmonise with the convictions of those sheep farmers who consider that exercise is essential to the health and hardihood of their flocks, and that close confinement in sheds and small yards, in a state of unnatural warmth, and amidst the effluvia which arises from fermenting litter, must be more or less prejudicial to sheep, excepting those which are to be transferred at once from their prisons to the shambles. —*Martin Doyle.*

On Flax Culture.—I had no idea that you would publish any part of my former letter on this subject; and as you have thought proper to publish a part and not the whole, I hope you will now find room for my explanations of assertions, which must, from the amount of profit named as being realised by the culture of the Flax plant, appear to some of the old school of farmers a regular delusion. I beg leave to hand you a pamphlet from the Belfast Flax Society, which, in pages 7 and 16, will corroborate the facts represented by me so far as prices go, and as for the expenses incurred, I venture from my practical experience to lay before your readers the following plain statement:—I have told them 60*l.* per acre can be made by the cultivation of the plant; it is but fair I should show such a result is to be accomplished. The following are the particulars of the expenses of growing an acre of Flax in Ireland, and the profits derived from the same:—

	£	s.	d.
An acre of land, including taxes	2	5	0
2½ bushels of seed	1	10	0
Ploughing and sowing	0	10	0
Weeding, 12 hands at 8*d.* per day	0	8	0
Pulling, 12 hands at 1*s.* „	0	12	0
Watering, 7 hands at 1*s.* „	0	7	0
Scutching, 70 stone at 10*d.* per stone	2	18	4
Lifting, &c. &c., 10 hands at 1*s.* per day	0	10	0
Carting to mill and market, ⅛ ton	0	19	8
	10	0	0
Produce according to Mr. Denman's account in page 16	£70	0	0

Thus, Mr. Editor, a profit is shown of 60*l.* These particulars I am prepared to prove, and if any of your readers desire further information, I shall at all times feel pleasure in affording it. As several gentlemen have expressed a wish to obtain a work on the subject, it is my intention to put together such information and instructions on the cultivation of Flax, as may be advisable to follow in order to grow the finer qualities, as I must repeat that it is much to be regretted that our French and Belgium neighbours should take from us five millions of pounds sterling annually for Flax, an article that our farmers can and ought to grow themselves.—*J. H. Dickson.*

Number of Gallons in Tanks of various Forms and Dimensions.—The following is a Table showing the contents in gallons of square-built and of circular tanks of various dimensions:—

THE NUMBER OF GALLONS CONTAINED IN SQUARE-BUILT TANKS.

Length.	Breadth.	When the Depth is							
ft.	ft.	3 feet.	4 feet.	5 feet.	6 feet.	7 feet	8 feet.	9 feet.	10 feet

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The Council having referred the communication made to them at their last meeting by his Grace the Duke of Richmond, on the results obtained by the application of sulphuric acid and bones, as a manure for Turnips, to the Journal Committee, Philip Pusey, Esq., M.P., the Chairman of that Committee, has recommended to the Council the publication of the following reports on that subject:—

I.—The Duke of Richmond's Experiments.

Experiments made on Turnips with five different kinds of manure, on the farm of Gordon Castle, in the year 1843. The seed (Dale's Yellow Hybrid) was sown on the 15th of June, and as it was wished to ascertain the result while the Duke was at the Castle, the Turnips, before they came to maturity, were taken up on the 3d of November, and carefully topped and weighed.

1st.—One imperial acre, manured with 8 bushels of bones and 14 cubic yards of farm-yard dung, at an expense of 3*l.*, produced 12 tons.

2d.—One ditto, manured with 2 cwt. 91 lbs. of guano, at an expense of 1*l.* 17*s.* 4*d.*, produced 11 tons 4 cwt.

3d.—One ditto, manured with 16 bushels of bones, at an expense of 1*l.* 16*s.*, produced 11 tons.

4th.—One ditto, manured with 83 lbs. of sulphuric acid and 2 bushels of bone-dust, mixed with 400 gallons of water, at an expense of 11*s.* 6*d.*, produced 12 tons 4 cwt.

5th.—One ditto, manured with 83 lbs. of sulphuric acid, mixed with 8 bushels of bones, and sown with the hand, at an expense of 1*l.* 5*s.*, produced 11 tons.

(Signed) Thomas Bell, Farm Steward.

II.—Dr. Manson's Experiments.

My field of twenty-one acres was last autumn deeply ploughed with three horses out of Oat stubble, it having previously carried a Wheat crop after two years' ley, well manured. In the spring it underwent the usual process of cleaning, and received about the 1st of June, twenty-five quarters of Linksfield lime. Drilling and sowing commenced upon the 10th, allowing four bushels of bones and ninety-six pounds of sulphuric acid, properly diluted with water, to the acre. The manure was prepared by putting into a large vat, placed in a corner of the field to be sown, thirty-two bushels of bone-dust; and for each bushel was added ninety-six pounds of water, and twenty-four of sulphuric acid; there were thus in the vat at once 32 bushels of bones, 384 gallons of water, and 47½ gallons of sulphuric acid. The whole was allowed to lie for a fortnight previous to use, when it was found that the acid had nearly dissolved all the bones. The mixture was then drawn off and added to water, in a large water-cart, in the proportion of one gallon of the mixture to 50 of water, and it was distributed to the drills from three spouts into three drills at a time. The drills were previously slightly harrowed down, and immediately drilled upon receiving the liquid manure. Owing to the great drought which prevailed at the time of sowing, and the very recent liming, very few of the seeds vegetated till after the rain, which fell about a month from the time of sowing. The heavy gale which prevailed about this time cut down the greater part of the early plants, and has thus left the field deficient in some places. I observed that after the field came to be singled, it underwent that process in the order in which it was sown; 13 acres having been sown with farm-yard manure, and the remaining 8 with the bones and sulphuric acid, the plants from the acid keeping the lead of those sown with court manure, and are to-day a heavier crop, though not looking quite so healthy in the blade, owing to their having come earlier to maturity. The expense, 1*l.* per acre, viz., 4 bushels of bones, at 2*s.* 6*d.*, 10*s.*; sulphuric acid, 96lbs. at 1½*d.*, 10*s.* Those laid down with court manure received 20 cart-loads per acre, at 2*s.* 6*d.* per load, 2*l.* 10*s.* Weight, per Imperial acre, as ascertained on 15th November, the date of weighing:—

	Tons	cwt.	lbs.	
Sulphuric acid and bones	12	5	80	per Imperial acre
Court manure . .	10	17	104	ditto

Spynie, Oct. 20, 1843. (Signed) D. D. Manson.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

At the Special Meeting of the Council on the 15th inst., a letter was read from Mr. Charles M'Donnell, of Clifden, in the county of Galway, accompanying a specimen of dried Seaweed, pulverised, which he had prepared in great quantities, believing it to be a most valuable manure for raising Turnips and other green crops. Means were then taken for collecting subscriptions in Dublin, &c. towards the expenses to be incurred upon the occasion of the Great Meeting of the Society in Dublin on the 14th and 15th August next. The re-adjudication upon the bulls belonging to Messrs. Grey and Hill, about which a difficulty had arisen since the last General Meeting of the Society, was directed to take place on the 15th of April.

FARMERS' CLUBS.

Ayrshire Agricultural Association.—Professor Johnston delivered a lecture on Agricultural Chemistry to this Association, at Ayr, on the 30th ult., from which we extract the following:—"There are certain substances which are special to certain plants. Some plants require more alumina, potash, magnesia, &c. than others, and it is the key to successful Agriculture to know what particular ingredients in the soil every description of plant requires. A certain soil, for instance, may require more potash, magnesia, &c. for a particular crop, and yet that soil may be capable of yielding a very good crop of something that requires less of these ingredients. If you want to grow *a*, *b*, *c*, you must make the soil perfect in the substances necessary for all; without this it may grow *a* and *b*, but may be defective in that which is necessary for *c*. When you wish it to grow *c*, therefore, you must add what it wants for that purpose. Let me give an illustration of how it may be that a comparatively

fertile soil cannot be brought round by the ordinary application of farm-yard manure; how it may appear that a soil generally fertile will yet refuse to grow a certain kind of crop, and that although farm-yard manure be applied, still it will not give a very good crop of the particular description of grain wished for. Why is this? The conclusion that we have just come to accounts for it, namely, that the manure does not contain all the substances which the soil wants. This case is exemplified in the Carse of Gowrie. The farmer there manures as usual with farm-yard manure. From the soil manured in this way he may get a good crop of Turnips, but not of Clover. After having let a year run over, he may sow Clover, and the reason of this is, that the substance necessary for growing Clover is not contained in sufficient quantities in the farm-yard dung applied during the first year, and that it is only after a second application that the requisite quantity is obtained. The first quantity of manure that he applies—suppose 40 yards—contains, it may be, a portion, but not a large enough portion, of that substance which is necessary to ensure a good crop of Clover; he is thus debarred from growing Clover for that year, and it is only in the second year—when he has added another 40 yards of manure—that a sufficient quantity of that particular substance is collected. Suppose that this substance may be magnesia or soda, what a large expense does he not incur by adding 80 yards of manure; whereas, had he been aware of the principle upon which the growth of plants depends, he might have attained his object in the first year by giving the land an extra dose of magnesia or soda, at the expense, perhaps, of a few shillings! Thus we come to understand how a knowledge of the principles upon which the cultivation of the soil rests, acts upon the profits of the agriculturist—how his knowledge or ignorance of these principles comes home to his pocket."

Collingham.—The monthly meeting of this club was held on the 6th of Feb., when 35 to 40 members were present. It being the anniversary meeting of this Society, the officers had to be chosen, most of them being re-elected, except the secretary, who resigned. A lecture upon the Making and Repairing of Roads was delivered by Richard Parkinson, Esq., of Knapthorpe, whose thorough knowledge of the subject, obtained by long experience, enabled him to illustrate it in a very satisfactory manner. In his description of the formation of a new road, he commenced by recommending that it should have a close, firm, compact foundation; and that the soil underneath should be well drained, so as at all times to give the road a dry and firm foundation. He then suggested that a layer of Ling, Gorse, or straight Thorns should be laid; and above these a covering of sand free from gravel, and when this was sufficiently rolled by the action of carriage-wheels, he advised the application of the first covering of material, which should be limestone, if it can be had, or otherwise good clean gravel free from boulders, and mixed with a little lime. The road must be kept level with the rake until it is sufficiently firm to receive the second covering of gravel or material, after which less care will be required. The lecturer confined himself chiefly to gravel-roads, that being the most obtainable material in the neighbourhood. The mode of applying the gravel deserves particular notice. The necessity of separating it, by riddles at the time of getting it, into three sizes before it is applied, was urged. The expense of doing so will only be about 2½*d.* per ton; and the advantage of doing so shows itself in the greater ease with which, in roads so made, the surface is kept perfectly level. The coarsest material is laid first, and the finer sorts may be placed above it in layers one inch thick, and in stripes covering about one-third of the width of the road at a time, so that carriages may avoid the gravel, and a pleasant and safe road is then insured at all times of the year.

Halesworth.—At the meeting of this club on Feb. 2, a discussion took place as to "which is the most valuable root, under general circumstances, Beet or Swede Turnip." The gentleman who introduced the subject considered that the crop of Beet averaged several tons per acre more than that of Swedes, and taking this increased weight on light lands at only one-fifth part per acre, the advantage, if the Beet possesses equal fattening qualities with the Swede, must be very great, whilst on the heavy lands there cannot be a doubt of its superiority. Another advantage arose from the greater facility of getting off the Beet crop. Another member considered that a crop of Beet can be more certainly depended upon than a crop of Swedes; and, further, that Beet can be readily kept, and are excellent food throughout the season. It was also stated as the result of experience that the Beet had decidedly the advantage over the Swede, as regards the Barley-crop succeeding them; the same plan being pursued with regard to both, viz., both being got off the land at the same time, and the tops of both being ploughed in. An intelligent butcher gave it as his opinion that the meat was equally good whether the cattle were fed on Beet or Swedes. A gentleman whose opinion carried the greatest conviction—his practical experience and general business habits leaving no doubt of the correctness of his observations—submitted the following experiment, which he had made to ascertain the relative value of the two roots as regards their fattening properties; and stated, also, his belief that on an average, land which would produce 25 tons of Beet per acre, would not produce more than 15 tons of Swedes, the lands being manured equally well, and treated alike in every particular. Ten beasts, averaging about 60 stone each, were put upon Beet-root. Each beast consumed about 15¼ cwt. of root sliced, and 3½ stone of cake per week; therefore one acre of Beet-root, producing 25 tons, would feed one beast 33 weeks, allowing in addition 7lbs. of oil-cake per day. Twelve beasts, weighing about 50 stone each, were put upon Swedes, and each consumed about 15 cwt. of Swedes and 3½ stone of oil-cake per week. Fifteen tons of Swedes is supposed to be a fair average crop in this neighbourhood, and each beast would thus consume that quantity in 20 weeks, with the addition of the 3½ stone of oil-cake per week. It thus appears that assuming the above quantities to be the average produce, an acre of Beet would last a beast 13 weeks longer than an acre of Swedes. The animals appeared to do equally well on either root.

It was resolved, that the opinion of the members present is decidedly in favour of the Beet-root over the Swedish Turnip under general circumstances, its weight per acre of the former, being much greater than that of the latter, and its fattening properties being fully equal in every respect, with this additional advantage, that the Beet is equally valuable as a food throughout the whole season.—*W. Reynolds, Secretary.*

Reviews.

On Thorough Draining, and its Immediate Results to Agriculture; being a Paper read before the Wakefield Farmers' Club. By John H. Charnock, Land-Agent, and Secretary to the Yorkshire Land-Draining Association. Rowland Hurst, printer, Wakefield.

THIS is a pamphlet which is likely to be practically useful to the farmer and landowner. We extract the following remarks upon the importance of drainage being executed efficiently and permanently, and on the necessity, therefore, of its being done chiefly at the cost of the landowner:—

"If there is one operation more than another in which the maxim that 'what is worth doing, is worth doing *well*,' holds good, it is in draining; *effective* and *permanent* must be your work, or it is comparatively money and labour thrown away. And for this reason, if for no other, should it be done under the superintendence of the landlord; it is in truth an owner's work; it is *principal invested*, and cannot, except by an occupier, be with justice treated as a mere outlay for repair. It is a permanent improvement of the fee, and if *permanently and effectually* done, gives as surely a rental fully commensurate with the outlay. At the same time, however, *rather than farm undrained land*, it is the palpable interest of the occupier himself to undertake the work, and especially if he previously concludes for any certainty of tenure. But the most desirable arrangement is, that owner and occupier should act mutually in the matter, and as the best interests of each are so intimately bound together, they should mutually concur in the execution of the work. And here I may mention the plan which is adopted on the Greenwich Hospital estates in Northumberland, under the superintendence and by the advice of that eminent Agriculturist, Mr. Grey, of Dilston, which I think may be considered as perfectly equitable and unexceptionable in all cases. The rule is this: if the drainage is done during the *first* seven years of the lease, the Hospital pays *one-third of the entire cost*; if during the *second* seven years, *one-half* the cost; and if in the *last* seven years of the term, it pays *two-thirds* of the cost of draining, assuming the lease to be for twenty-one years."

Mr. Charnock gives details of the amount of this cost, and means of diminishing it are pointed out; thus at p. 12 it is stated—

"That a due regard is not usually had in the cutting of the drains, so as to economise the labour consistently with full efficacy of operation. I allude especially to their being cut much wider than is necessary, considering that tiles of a very much smaller* area than are ordinarily used would be fully as effective; at all events, the higher extremity of each drain might be laid with them, and the size be increased in regular gradation as you descend to the outfall. It does not require to have a regular *grove* in your flesh to make it *bleed*—a *simple cut* is enough, and just so with the soil—only divide it ever so little, and *keep the sides of that incision asunder*, the water will flow, without converting your drain into a ditch."

There are some of the Author's suggestions in which, however, we do not acquiesce. Thus, it is recommended that some porous substances, as broken stones, be filled into drains above the tiles. The usefulness of doing this depends on the rain-water, as it falls upon the land, flowing over its surface down the declivity—the sides of a ridge, for instance—till it reaches the drain (which, if this theory be correct, should always be in the furrow), and there sinking through the porous material into the channel. But it should be the aim of the farmer to get rain-water to sink into the land just where it falls, and thus to find its way to the drains underground. Instead of having porous lines through his land every 16 feet, which this mode of draining would give him, it should be his aim to get *the whole* of the land sufficiently porous to a depth of 16 or 18 inches; and when it is conducted properly, there are very few soils on which the operation of subsoil-ploughing will not produce this porosity. Land in this condition will allow no surface-water to appear; the rain as it falls sinks at once, and finds its way to the drains underground.

We also object to Mr. Charnock's plan of using tiles without soles to support them in the drains. We quote the following from a lecture delivered before the Highland Society of Scotland, by Dr. Madden, of Penicuik, near Edinburgh.

"It is stated by many practical men, in regard to tile-draining, that when the subsoil consists of very stiff clay, the tile-soles may be dispensed with, and as the soles are somewhat costly, the farmers are willing enough to give them up, especially when they find that others have done without them, and yet their drains have continued to run well for some years. If, however, the opinion of a scientific person had been requested, he would at once have stated, that unless the drains rested on the surface of a rock, the tile-soles could in no instance be dispensed with, because, as Prof. Johnston justly remarks, '*There are no clays which do not gradually soften under the united influence of air and running water.* In the course of 10 or 15 years, the stiffest clays will soften and allow the tile to sink, and many very much sooner. The passage for the water is thus gradually narrowed.'"

It is right to say that the tile which Mr. Charnock considers capable of acting alone, is of a peculiar form, the edge on which it rests being widened in order to hinder it from sinking. Although we differ from the author of this pamphlet on these points, yet we cordially recommend his work to our readers. It contains many useful remarks on the practice of drainage, and much sound reasoning upon the effects which would follow its general adoption. We entirely agree with the author in the spirit of his concluding paragraph.

"Agricultural Societies might add materially to their usefulness, and to the general good, by directing their attention somewhat more palpably towards the improvement of the *soil*; bullocks, sheep, and pigs are now all fully up to the mark, let us see if the *land itself* cannot, under the same auspices, be brought into something like a corresponding state."

Mr. Charnock is secretary to the Yorkshire Land-draining Association, which has secured the services of Mr. Smith, of Deanston, as draining engineer. "This Association is formed for the purpose of affording to the Agricultural interest, by means of its collective capital, the funds necessary for the thorough draining of land;" without which these funds cannot be economically and efficiently applied; and now that capital as well as capability of applying it may be had on reasonable terms, there is reason to hope that the work of Agricultural improvement will progress rapidly; and in districts where tenants have a lengthened interest in their farms secured to them by lease, we have no doubt that the facilities afforded by Associations like this will be eagerly taken advantage of.

Miscellaneous.

Improved Method of Sowing Wheat.—After the destruction of so much of the young Wheats late in the spring of last year, it occurred to me, that by adopting a different method than what is at present practised in planting the seeds a similar disaster might in future be prevented. My idea was this:—to plough down the seeds, and that in such a way, if possible, as that the braird may come up in rows at equal distances between the drills; and instead of the usual practice of harrowing immediately after sowing, to allow the drills as left by the plough to remain entire throughout the winter and spring. The furrows, or drills, left in this manner, would, I am persuaded, form a shelter to the plants against the frosty winds which generally prove more or less destructive to Wheats in the months of March and April. In the case of drift, which is sometimes hurtful, the drills would retard the snows filling up the openings between them, thus covering up the plants in perfect safety from the changes in the atmosphere. Independent of drift, we have often a course of dry withering weather in spring, with strong sunshine during the day, which, with frosty nights, generally prove very injurious to young Wheats. Against this danger the drills, by the action of the weather, would be continually operating; for, mouldering down they would give, as it were, a constant hoeing to the plant, keeping the tender stem warm and dry.—*Correspondent of Ayrshire Agriculturist.*

Furrow Drainage.—For effectual furrow-drainage, the drains require to be made 30 inches deep, 20 inches broad at the top, and about 5 at the bottom, each drain 6 yards apart. They are to be laid with suitable concrete tiles, either made with moulds or made in the drain, or filled to the depth of 9 to 12 inches with stones, properly prepared, if to be had in the neighbourhood, with suitable soles where required, and these covered with large gravel to the depth of 6 or 8 inches, or some suitable substitute, upon which the soil taken out will then be used for filling up with. The tiles are to be made of Concrete or Hedderwick lime and gravel, mixed up with water to a proper consistency. When the field has been thus prepared, it is then to be worked to the depth of 12 to 15 inches with the subsoil-plough, according to the nature of the soil. A Scottish acre will contain about 900 yards, or 150 roods of six yards each, of drains, and will, therefore, require about 2700 tiles, each 12 inches long. It is understood that a boll of lime, with a proper proportion of gravel, will make about 1000 tiles of that length. The cost of the whole, with soles where required, filling up the drains, cartage, and any other extras, will amount to from 2*l.* 10*s.* to 3*l.* per acre. Mr. Gladstone proposes, that those of his tenants whose farms are under fifty arable acres, should drain and plough in the manner above stated, and in the present season, not less than 2½ acres; about fifty and under one hundred, not less than five acres; and those above one hundred, after the rate of not less than five acres for each hundred acres. In consideration of such work being done effectually and thus completed, to the satisfaction of Mr. Sheriffs, or some other competent judge to be appointed by him, Mr. Gladstone agrees to pay to each of his tenants the sum of 3*l.* per acre, and to charge each of them with interest thereon at

* "Mr. Thomas Hammond, of Penshurst, now uses no other size for the parallel drains than the *inch tile*, and it may be here stated that the opinion of all the farmers who have used them in the weald is, *that a bore of an inch area is abundantly large.*"—*Report on Drain-Tiles and Drainage, by Mr. Parkes.*"—*Journal of the Royal Agricultural Society of England, Vol.* iv., *Part* ii., *page* 375.

the rate of 4 per cent. per annum, in addition to their rents, from the dates of the payments to the expiration of their leases, and nothing more ——, in order to encourage his tenants in this undertaking, he engages, in addition, to allow to each, who shall complete the work described within the present season an abatement of 10 per cent. from their rents from the last crop.—*John Gladstone*, London, 11th March 1845.

Estimated cost per acre Scottish.

Montrose Review.

Destruction of the Weevil.—A liberal application of strong lime-water, with a brush, to the floors and walls of the granary, will effect its destruction, and a few days afterwards, the floor must be scoured with soap and the water, or the future corn placed upon it will be injured by the dust of lime.—*Oxford Herald.*

Notices to Correspondents.

Our Correspondents will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

Communications from the following Correspondents are in type, and are only waiting till room can be found for them:—*P., A. C. Hornewatle, J. West, W. Billington, Herbert, M. J. Berkeley.*

Agricultural Architect.—*A Subscriber.*—Mr. Newland, assistant to Professor Low, University, Edinburgh, is the only person we know who devotes himself exclusively to this branch of business.

Agricultural Courses.—*A Subscriber.*—It is the shame of our country that it contains no public school of Agriculture. There is a Lectureship on Agriculture annexed to the Edinburgh University, and at Abermoyle, in North Ireland, there is a College of Agriculture, but in England there is nothing of the kind. The Bedford Farmers' Club, urged on by Mr. R. J. Brown, of Cirencester, have, however, taken measures, which will, we hope, speedily result in the establishment of some such institution in that neighbourhood.

Analysis of Subsoil.—*Novice.*—Your analysis is not adequate as a guide by which to answer your question. It does not mention lime, although you speak of the presence of chalk. If the land is worn out, try plenty of manure, farmyard dung, or bone-dust, or guano, the first year, and afterwards grow enough green crops, by the consumption of which on the land you may preserve its fertility. You must not trench-plough yet, subsoil-plough it. This can be done by a two-horse implement. For answer about Grasses, next week.

Books.—*G.*—Martin Doyle's "Practical Husbandry," and Professor Low's "Elements of Practical Agriculture."

Bones.—*C. W. K.*—Autumn is the best season to apply lime. Bones form an admirable manure for Turnips on light soil.

Experiments on Manures.—*W. E. Brodie.*—We shall be glad to hear your reports on this subject, but cannot pledge ourselves to publish them all.

Food for Pigs.—*A. C.*—For pigs, Peas, &c. should be ground; for sheep, and all animals chewing the cud, this is not necessary. Your cook above the steam-boiler is as simple an apparatus for steaming food as you can have. There is necessarily a waste of steam: it passes through the Potatoes, and a portion escapes in the best machines of the kind. The want of success attending the application of grain in certain instances must be owing simply to the pre-existence in the land in sufficient quantity of the substances which guano contains.

Frozen Turnips.—*Anglais.*—Ewes with lamb will not injure themselves by eating frozen Turnips.

Guano.—*Vigil.*—Do not mix lime with guano; it will render its ammonia volatile.——*H. C. S.*—We do not know if it has ever been applied in the field in solution; but, unless during wet weather, it is the best way of using it. See third answer in this section of last Paper.——*A. O.*—Mix 3 cwt. per acre well with the soil in the bottom of the drills before you plant Potatoes. This can be done with a horse-hoe.

Horticultural Oats.—*Geoge.*—This variety is distinguished by its productiveness, and the quantity and nutritiousness of its straw. Turn your compost repeatedly, and apply to any green crop. If the soil is light, the proposed treatment of it will be beneficial. We prefer bones to the guano under the circumstances.

Italian Rye Grass.—*C. N. N.*—If your land be in good order you have a chance of a crop of Hay from seed sown this spring; but your much better plan would be to plough the stubble immediately, and work the land well this spring, and take a crop of Swedes, or other roots.

Lumbrics as Manure.—*E. P.*—We know of no instance in which Lumbrics have been gathered for this purpose.

Liquid Manure.—*G. C.*—The expense of a water-cart is not one of the items to which a plan of saving liquid manure necessarily subjects the farmer. Indeed, he hardly needs a tank. If a small cistern be placed to receive the drainage of the stable and cattle-stalls, the water may be baled out of it every other day or so, and thrown over heaps of dung, earth, &c., placed by it for the purpose, and this will preserve it as well, or even better, than if it were accumulated in a large tank, and carted to the field in a water cart. The best way of using liquid manure is to soak earth and dung with it in this way; there is a difficulty in spreading it uniformly in any other way, especially on sloeland ground, with a water-cart. If the volatile ingredients of the liquid manure be fixed by adding sulphuric acid, it may be used at once; if not, let it putrefy before using it. It thus has time to absorb carbonic acid from the air, and in a degree to lose its causticity, but at the same time it loses much ammonia. A good water-cart can be made by attaching to a 100 gallon cask a pipe pierced with holes, to scatter the water; carry it to the field on a frame supported by a pair of cart-wheels.—*K.*—Dig a circular hole, 8 feet deep and 12 feet in diameter, pitch the bottom, and build a stone and lime facing 18 inches thick. Soak your dung-heaps with the water. Pare and burn old Grass and you intend to break up, plough the ashes under, 4 inches deep, harrow, cross plough 6 inches deep, harrow, &c., and take a crop of Turnips. We do not know the Malta Turnip. The Orange Globe is the best.—M. Wurtzel.

Limestone as Manure.—*Reece.*—If the marls you refer to are those of the new red sandstone formation, which occur in considerable extent around Exeter, then they are very *slightly* calcareous, and they differ materially from the crushed limestone you allude to, inasmuch as that is almost *wholly* calcareous. The value of marl as a topdressing for land often, however, depends on the presence in it of substances occurring in very minute quantities, and not necessarily upon the quantity of the lime which it contains. (See articles on this subject, translated from Sprengel, in this Paper.)

Lucerne.—*G. B. Fortner.*—Next week.

Mangold Wurtzel.—*Tyro.*—Don't sow till mid-April. We shall refer to this matter before then.

Manures.—*A Subscriber.*—Cut the carcases up into small pieces and [illegible] to good compost-material; [illegible] the soil immediately over and underneath it with the manure, so that each [illegible] manure to the roots when they first commence growing. It is always best [illegible] a fermentation takes place after putting manure to the roots. It is always best [illegible] the manure gradually down to the roots, [illegible] the surface of the ground. [illegible] are attacked with the [illegible] and if [illegible] dug, rather [illegible] by the roots. It must be [illegible] that, in this process, they are [illegible] as it [illegible] that not so much, but [illegible] made up by the Vitality of [illegible], &c., destroyed by their consumption.

Manures.—*Agricola.*—Grub up the Heath and burn it, digging from the parts [illegible] and spread it before winter; plough it under in spring.

Mixtures.—*John H. Lloyd.*—You speak of putrified vegetables, as if the [illegible] proved it to be a valuable manure. This is not enough to show that the process of putrefaction produces changes, the nature of any substance that is [illegible] to it. As some portions of the vegetable which is undergoing putrefaction is washed away, its place is supplied by one of mineral matter, so that ultimately its composition is entirely changed, and according to the nature of this mineral, are the properties of the future production. Burning or many other putrefactions, and, however much [illegible], from having been the components of living animals, might be profitable as a manure to mercly [illegible] flints in this way. The fact of your rock having *once* been a mass of vegetables, therefore proves nothing as to its *present* composition. The only way to ascertain that is by chemical analysis; and we repeat it, the statement you give us on this head is, with but little variation, true of most of the soils in the country. [illegible] per centage of magnesia, in the specimen you refer to, is large, but lime earths are not always a necessary ingredient in soils. There is no doubt of the fact, with which you appear to be fully impressed, that the [illegible] ingredients of plants are essential to their luxuriant growth; but when speaking of these in determining on a proper manure for the soil, it is not [illegible], but the [illegible] of them, nor is it always the case to which we refer, but it is the roots and petals, and [illegible] and [illegible] acting in [illegible] and of which [illegible] besides the carbon, that we ought to take care of. We do not know how, from our previous remarks, you could have inferred our opinions as to the [illegible] of your land for Peas, Clover, Turnips, &c., that depends on its texture, &c., and upon the [illegible] in which it is and has been cultivated, with all which particulars we are unacquainted.

Pigeon Pea.—*Constant Reader.*—We are informed that Vetches are often called "Pigeon Peas," and the common Poplar Pea is also called so sometimes. Both of these are occasionally ploughed in green for manure; but we know of no Pea to which the name "Pigeon Pea" solely appertains, except a tropical plant called by botanists, Cytisus Cajanus.

Salt and Lime.—*M. D.*—The lime should be *dead* when it is used, i. e., it should be a carbonate. The water of the salt is of little consequence in the process which ensues. The carbonic acid of the carbonate of soda which results is obtained from the lime. At twenty miles from the sea your land should contain salt enough; but try a small experiment on your Grass, and see if it benefits from a salt top-dressing. Thanks for your offer.

Soils.—*J. W. Lloyd.*—The fertility of a soil is better ascertained by comparing its treatment with its produce, than by analysis. Your nodules of limestone are not coprolites, if they occur in plenty, they may be advantageously burnt for lime.

Soot.—Put 30 to 40 bushels on an acre now. It does not require admixture.

Steeps for Seeds.—*H. B.*—Any direction on this subject must as yet be founded on mere theory. We shall shortly publish articles on the mineral constituents of agricultural plants, and then you can judge in this matter for yourself, for the object of the operation is to increase the quantity of these mineral constituents.

Tackling Sheep and Young Cattle.—*Green.*—1*l.* to 1*l.* 5*s.* per week for your sheep, and 1*s.* 6*d.* to 2*s.* for your cattle, on Swede Turnips.

Tithe Commutation—Apportionment of Rent-charge on Woodland broken up.—*Constant Reader.*—Woodland broken up before the Commutation of the Tithes, will be subject to have a portion of the Rent-charge apportioned upon it.

Tobacco. Wool.—*Anglais.*—The duty on unmanufactured Tobacco, whether from Foreign countries or British possessions, is 4*s.* per lb. We presume that our Correspondent is aware that the growth of Tobacco for sale in this country is prohibited. Wool may be exported on payment of a duty of 1*s.* the cwt.

Wheat-Sowing.—*Wm. Steele.*—You have come to a right determination, we think, in sowing Wheat rather than Barley. Sharreff's White Wheat, known in Scotland by the name *Hopetoun*, is one of our best spring Wheats; Red Straw White Wheat is also a good variety. We think Messrs. Barrett and Exall, of Reading, manufacture a horse-hoe for Wheat; but we have no experience of it, having always hoed our Wheat crop by hand. The best plan of sowing Clover-seed is by means of the hand broadcast sowing machine, price 6*l.* This scatters the seed over the growing crop of Wheat, and it is covered by a single tine of the harrows across the drills. We shall be very glad to receive from you a report of your experience in transplanting Swedes rather than drilling the seed.——*J. W., Worcester*, will find the work advertised, col. *e*, p. 96.

*** As usual, many communications have been received too late for answering this week.

Markets.

SMITHFIELD, Monday, Feb. 10.—Per stone of 8 lbs.

Best Short Horns	3	4	3	8	Best Down & Half-breds	4	0 to 4 6
Second quality beasts	3	8	3	10	Best Long-wools	3	10 4 2
Calves	4	0	4	4	Lambs and second quality	3	4 3 8
					Pigs	3	4 4 0

Beasts, 2,750; Sheep, [illegible]; Calves, 70; Pigs, 250.

Our trade to-day exhibits the usual [illegible] of the commencement of Lent. The supply consisted chiefly of Beef, in which articles there seemed to be rather a brisk trade in the early part of the day, but there was much difficulty in supporting our highest quotations, and 3*s* 10*d* per 8 lbs. was the more general price for the very best qualities, and 3*s* 6*d* for 8 lbs. for the best Short-horns. Mutton is a much heavier sale than of late; the quantity is rather larger, the demand less, owing to the large consumption of fish at this [illegible] season. Many [illegible] have [illegible] made no more than as [illegible] and the best [illegible] more general price, too, for Long-wools would be 4*s* per 8 lbs., although in both cases some of the most selling realised our highest quotations. In Calves the trade is steady; there is a short supply of the best quality.

Friday, Feb. 23.

As regards prices our trade to-day is a counterpart of Monday's. There is a very slack attendance of buyers, and short as the supply is, there will be a difficulty in making a clearance. There is, perhaps, a slight improvement in the sale of very best Calves—that description being scarce, they readily make 5*s* per 8 lbs.

Beasts, 930; Sheep, 2010; Calves, 70; Pigs, 250.

—, West Smithfield.

POTATOES.—Southwark Waterside, Feb. 19.

Since our last Report the weather has changed from cold and frosty to a spring-like mildness, which in some measure arrested the anticipated improvement; notwithstanding, there was an increased demand for the best samples (Devonshire Reds excepted), and the middling and inferior sorts have been more looked after. Our last quotations have been well supported. The supply during the past week has been moderate.

York Reds	-	-	80*s* to 85*s*	Kent and Essex Whites	-	80*s* 90*s*
Perth	-	-	65 70	— — Kidneys	-	65 70
Early Devons	-	-	65 70	Wisbeach Kidneys	-	65 ——
Late Devons	-	-	70 ——	— Blues	-	55 ——
Cornwall	-	-	65 70	— Whites	-	50 55
Jersey and Guernsey Blues			60 ——	Prince Regents	-	60 70

THE GARDEN.

Covent Garden, Feb. 24.—Notwithstanding the unfavourable state of the weather during the week, the supply of fruit was pretty well sustained, and trade is not dull. Fine Apples are to be procured, and as a little increased in price. Pears, also, begin to bring much the same prices as last week. Good Pears, particularly a few good specimens of Easter Beurré and Beurré Bosc, are however to be met with in the Market. Kingsale grown Apples are scarce. Bad foreign ones are sufficient for the demand. Oranges and Lemons are very plentiful, and good in quality. Chestnuts are offered at nearly the same prices as last week. The supply of most kinds of Vegetables is sufficient to meet the demand. Sprouts are plentiful, and are a little reduced in price, being offered at from 4*d* to 6*d* per dozen. Brussels Sprouts are sufficient for the demand, as are also Greens. The latter are offered at from 4*s* to 5*s* per score. Cauliflowers and Sprouts are tolerably well supplied, the latter in particular. Brocoli has become very scarce. Fruiterers' prices are much the same as in our last report. Asparagus is a little increased in price, and somewhat Sea-kale. The latter is selling at from 4*s* to 5*s* per punnet. Leeks are plentiful, and have taken possession of the ground which is recently vacated. Rhubarb is selling at from 1*s* to 2*s* per score. A small quantity of Spring Radishes has been brought to the market during the week. Cucumbers are quite the same in price as in our last report. Horse Radish is sufficient for the demand. Among Cut Flowers we noticed Camellias in great variety, Erica jasminiflora, Burchellia capensis, Epacrises, Azaleas, Acacias, Camellias, Tulips, Primulas, and Roses.

FRUITS.

Pine Apple, per lb., 4*s* to 12*s*		Almonds, per peck, 4*s* to 5*s*	
Grapes, Portugal, per lb. 1*s* to 2*s* 6*d*		Sweet Almonds, per lb., 2*s* 6*d* to 3*s*	
Apples, doz., p. bush. 3*s* to 18*s*		Nuts, Spanish, per bushel, 16*s* to 18*s*	
— Kitchen, p. bush. 3*s* 6*d* to 8*s*		— Brazil, 16*s*	
Pears, per half-sieve, 1*s* to 12*s*		— Barcelona, 20*s* to 22*s*	
Oranges, per dozen, 6*d* to 2*s*		— Cob, per 100 lbs., 18*s* to 20*s*	
— per 100, 24*s*		Chestnuts per peck, 2*s* to 3*s*	
Lemons, per dozen, 1*s* to 3*s*		Filberts, English, p 100 lbs., 60*s* to 65*s*	
— per 100, 6*s* to 14*s*			

VEGETABLES.

Rhubarb, per bundle, 6*d* to 1*s* 6*d*		Leeks, per dozen bunches, 6*d* to 9*d*	
Broccoli, per bundle, 1*s* to 2*s*		Garlic, per lb. 6*d* to 8*d*	
Brussels Sprouts, p. bushel, 1*s* 6*d* to 3*s* 6*d*		Onions, 24 to 40 p. bush.,	
Cabbages, per score, 1*s* to 2*s* 6*d*		— Large, per bushel, 2*s* to 3*s*	
Red Cabbages per score 2*s* to 3*s*		— Spanish, per dozen, 1*s* to 1*s* 6*d*	
Savoys, 1*s* to 1*s* 6*d* p. half-sieve.		— pickling, p. bushel, 2*s* to 3*s* 6*d*	
Asparagus per bundle 2*s* to 3*s*		Shallots, per lb. 6*d* to 8*d*	
Sea-kale, per punnet, 1*s* to 2*s*		Chives, per bunch, 1*d* to 2*d*	
French Beans, per 100 to 150		Lettuce, Cabbage, per score, 6*d* to 1*s*	
Autumn Potatoes, 4*d* to 6*d* per lb.		— Cos, per score, 6*d* to 1*s*	
Savoys, per doz. 6*d* to 1*s* 6*d*		Celery, per bun., 6*d* to 2*s*	
Greens, per doz. 3*s* to 4*s* 6*d*		Mushrooms, per pottle, 1*s* to 2*s*	
Potatoes, per ton, 70*s* to 90*s*		Walnuts, per bushel, sheltered, 12*s* to 16*s*	
— per cwt., 3*s* 6*d* to 4*s*		Small Salads, per punnet, 2*d* to 3*d*	
— per bushel, 1*s* 6*d* to 2*s* 6*d*		Watercress, per doz. bunches, 3*d* to 6*d*	
— Kidneys, p. bush., 3*s* to 3*s* 6*d*		Parsley, per doz. bunches, 3*d* to 5*d*	
Turnips, per doz. bunches, 1*s* 6*d* to 2*s* 6*d*		Tarragon, Green, per bun. 3*d* to 6*d*	
Red Beet, per dozen, 1*s* to 1*s* 6*d*		Basil, per score, 1*s* to 1*s* 6*d*	
Horse Radish, per bundle, 1*s* to 1*s* 6*d*		Thyme, 3*d* to 4*d* per bunch	
Radishes, spring, 1*s* 6*d* to 2*s* p. pun.		Marjoram, green, p. doz. bun. 1*s* 6*d* to 2*s*	
Carrots, p. doz. bun., 2*s* 6*d* to 3*s*		Chervil, per punnet, 2*d* to 3*d*	
Cucumbers, 1*s* to 1*s* 6*d* each		Sweety, per pottle, 1*s* to 1*s* 6*d*	
Spinach, per sieve, 2*s* 6*d* to 3*s* 6*d*		Scorzonera, per bundle, 1*s* to 1*s* 6*d*	

WOOL.—British, Friday, Feb. 21.

In our English Wool Market we have observed no material alteration from our last Report. Things continue quiet, and some are of opinion that they are rather faster. Prices have not at all receded, nor do we think they are likely to do so.

	per lb.				per lb.	
Long-wooled Wethers	1*s* 1½*d*	to 1*s* 2*d*		Southdown Hoggits	1*s* 1½*d*	to 1*s* 2½*d*

				Turnip (too variable for quotation)			

Ingmford and Lee.

MARK LANE, Friday, February 23.—The arrivals of Wheat during the week have been small, and the few parcels of English fresh up this morning realised fully Monday's quotations. Business in free Foreign is limited, but holders are very firm. We have not heard of any sales of Bonded, but several parcels of Baltic for Spring shipment have been taken on fully as good terms.—In Barley, Beans, and Peas there is no alteration.—Oats are held firmly, excepting where vessels are on demurrage, in which case rather lower prices are obliged to be accepted.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, Gloucester place, King's-road, Chelsea.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL-ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

	£	s.	d.
Cottam's Patent Boiler, 18 inch	2	15	0
Rogers' Boiler, small size	1	17	0

Larger in proportion.

Hot-water Pipe, at 2, 3, and 4 inches, at reduced prices.

GARDEN ROLLERS 18 inches long, 34*s.*; 20, 44*s.*; 22, 50*s.*; 24 inches, 60*s.*; 26, 75*s.*; 28, 84*s.*; 30, 105*s.* each.

CAST-IRON RICKSTANDS, 2 feet six inches high, 5*s.* 9*d.* each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

STRONG IRON HURDLES, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3*s.* 6*d.* each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing	42 lbs.,	4	0	,,
Strong do. do. do.	45 lbs.,	4	4	,,
Ox Hurdles, 4 feet high, do.	60 lbs.,	5	6	,,

BEST WIRE, for STRAINED WIRE FENCING, at 8*s.* per bundle of 150 yards each. Uprights for ditto, 7*d.* each. The Improved continued, and every kind of Fencing, Fancy Wirework.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3*s.* 6*d.*; 20 inches, 4*s.* 6*d.*; 22 inches, 5*s.* 6*d.* each.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 7*s.*; 4 ft. 6, 9*s.*; 5 ft., 11*s.*; 6 ft., 15*s.*; 7 ft., 20*s.* per dozen.

SHOW-ROOMS at the Manufactory, No. 2, WINSLEY-STREET, where every information may be obtained.

The TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentleman, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had detailing the prices, &.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with synopsis of mode of use, on applications to MARK FOTHERGILL, 40, Upper Thames-street, and 5, Railway Place, Mark-lane, London.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt.

Phosphate of Potash	. . .	15*s.* per cwt.
,, Soda	. . .	12*s.* ,,
,, Magnesia	. . .	9*s.* ,,
,, Ammonia	. .	1*s.* per lb.

James Hall, Esq., Scarborough, Beverley
James Hamerton, Esq., Hellifield Peel, Skipton
J. Mildred Hustler, Esq., Bradford
R. M. Jaques, Esq., Easby Abbey, Richmond
James Smith, Esq. (Deanston), 8, Whitehall-place, London
Mr. William Tuke, Bradford.

With power to add to their number.

Bankers.—The York City and County Banking Company.
Standing Counsel.—H. Bellenden Ker, Esq., Lincoln's Inn.
Solicitors.—Messrs. Blanchard, Richardson, and Gutch, York.
Draining Engineer.—James Smith, Esq. (Deanston).
Secretary.—John H. Charnock, Esq., Wakefield.

The object of the present undertaking is to avail itself of the provisions of this Act, so far as they apply, and by offering an ample and easily-accessible capital, to induce the parties contemplated therein to seek the benefit of its provisions; and, at the same time to afford to the Agricultural Interest generally, on equitable terms, and on the same principle as that on which the act proceeds, the requisite means for thoroughly draining the land.

The Capital to be 500,000*l.*, in stock of 25*l.*, with a deposit of 5 per cent. on its allotment; the amount and time of the calls to be regulated by the demand, as it arises, for the beneficial employment of the money, and so that no one call exceeds 20 per cent., with a notice of not less than two months for each payment.

The management to be under an effective Committee, elected by and from the Subscribers, with the most efficient Staff that can be selected for practical and scientific skill in their several departments.

The head office to be in York, with Agencies in other towns of the county and elsewhere, as the demand for the assistance of the Association may require, and as it may be found advantageous to extend the sphere of its action.

The Meetings of the Committee of Management to be held Monthly, or oftener if necessary, and of the General Subscribers Annually, to receive the Report of the Committee, pass the Accounts, and transact other general business.

Interest after such a rate as the Committee of Management may see reason to recommend, to be allowed half-yearly on the Capital paid up, so soon as the returns on the money expended will permit; together with such further division of profits as, on a General Settlement to be made every four years, the affairs of the Undertaking will justify.

The Accounts to be balanced annually, prior to the General Meeting, and audited by competent parties duly elected.

At a meeting of the Council of the YORKSHIRE AGRICULTURAL SOCIETY, held in York on the 20th of December, 1843, a resolution was passed approving generally of the objects of this Association; and at the monthly meeting of the Wakefield Farmers' Club, held on Jan 5, 1844, a resolution approving of the principle and objects of the Association was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool in July, 1841, Lord Stanley remarked that, "There was no bank in the whole country—no commercial speculation—no investment so safe, so pure and profitable, as that in which even borrowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship in a letter to the Committee says—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country if confined to its legitimate object—the lending of Capital on the security of an investment in draining; and I think it very probable that many Landed Proprietors would avail themselves of the facilities afforded by an Institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend."

Bearing in mind, then, the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return of the Capital embarked will be such as to insure the support of prudent and *permanent* Investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Applications for Prospectuses, &c., to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or, to J. H. CHARNOCK, Esq., the Secretary, Wakefield.

GENUINE PERUVIAN & BOLIVIAN GUANO
ON SALE, BY THE IMPORTERS,
ANTONY GIBBS AND SONS, LONDON:
GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL.
47, Lime-st., Jan. 31, 1844.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported.—Apply to COTESWORTH, POWELL, and PRYOR, London; EDWARDS, DANSON, and Co., Liverpool; or WILLIAM J. MYERS and Co., Liverpool, the Importers.

MANURE FOR GRASS, &c.—POTTER'S GUANO.
Testimonial of Lord Zetland, Dec. 2, 1842.

POTTER'S GUANO, 2 cwt. per acre, yielded of *Hay*	2 tons 8 cwt.
Peruvian Guano, 2 cwt. per acre, yielded of *Hay*	1 ,, 18 ,,
Difference in favour of Potter's Guano	10 cwt.

BEAUTIFUL FLOWERS.—POTTER'S CONCENTRATED LIQUID GUANO, in quart bottles, 1*s.* 9*d.* each, at the principal Chemists and Seedsmen in town and country.

"I used POTTER'S GUANO on my Pansies; they were *much larger* than I ever had them before, and remained in full blow longer than I ever recollect. JOHN RITSON, Sunderland."

"POTTER'S GUANO will convert your desert into a paradise."—Professor LINDLEY, in *Gardeners' Chronicle*, 1843, p. 560.

Works, 28, Upper Fore street, Lambeth.

For further testimonials see this Paper of the 6th Jan., 1844.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2*s.* 6*d.*, quarts, 4*s.* 6*d.* each. One pint is sufficient to coat four Frames twice over, each Frame to be 5 ft. by 3 ft. 3 in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

THE URATE of the LONDON MANURE COMPANY, 5*l.* per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

70, STRAND.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED,

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps, Well Engines, &c.

GREAT ECONOMY.—Much time and a great deal of labour will be saved by the use of the SUSSEX CHURN. ATTWOOD, WIMBLE, and WARNER, Manufacturers, Lewes. This Churn being made entirely of block tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes at all seasons of the year. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes.	Nos. 00.	0.	1.	2.	3.
Churn	2½ lbs.	4 lbs.	7 lbs.	14 lbs.	28 lbs. of butter.
Price with pans complete,	18*s.*	20*s.*	25*s.*	33*s.*	40*s.*

Delivered, carriage paid, to any part of London.

London Agents.—BENHAM, 19, Wigmore-street, Cavendish-square; LIVERMORE, 30, Oxford-street; BAILY, 71, Gracechurch-street; WRIGHT'S Range Warehouse, near the Monument.

Export Agent.—BARNES & Co., 109, Fenchurch-street.

N.B.—To be seen at the Polytechnic, and Adelaide Gallery.

Observe.—The Improved Water Pail, 4*s.* and 5*s.* each.

PARKER'S COLLECTIONS IN POPULAR LITERATURE.

DEATH OF MR. LOUDON.

At a Meeting of the Friends of the late Mr Loudon, held at 21 Regent Street, for the purpose of considering the best means of extricating his Widow and Daughter from the difficulties in which they are placed by his sudden death,—

Professor Lindley having been called to the Chair, it was

Resolved:—

1. That in the opinion of this Meeting, very great services were rendered to Horticulture by the late Mr. Loudon.—2. That the difficulties in which his family is now placed, have arisen from his zeal in the promotion of gardening, and not from personal imprudence.—3. That the Works of Mr. Loudon are themselves of sufficient value to place his family in independent circumstances, provided they can be sold; and in the opinion of this Meeting, it is most desirable that the friends of Horticulture should exert themselves to effect that end.—4 That since many persons, who already possess Mr. Loudon's Works, are probably desirous of subscribing towards a Fund for the assistance of his family, it is desirable that, in addition, a Subscription List be opened, to which the Friends of Horticulture may be invited to contribute. 5. That a Committee be appointed to receive Subscriptions, and to act otherwise as to them may seem expedient.—6. That the following Gentlemen be requested to act as Members of such Committee, viz.:—

Dr. Henderson, Secretary of the Horticultural Society.	James Cook, Esq., Brooklands.
James Hudson, Esq., Secretary of the Royal. Agri. Society.	Mr. Marnock, Royal Botanic Garden, Regent's Park.
William Spence, Esq., Lower Seymour Street.	Mr. Charlwood, 14, Tavistock Row, Covent Garden.
Mr. Paxton, Duke of Devonshire's Chatsworth.	Mr. Henderson, Pine Apple Place, Edgeware Road.

With power to add to their number.

The Committee, earnestly endeavouring to carry into effect the foregoing resolutions, respectfully present the following, as a List of the Works of the late Mr. Loudon, the sale of which will best promote their object, viz.:—

THE ARBORETUM ET FRUTICETUM BRITANNICUM; in Eight Volumes: Four of Letterpress, illustrated by above 2500 Engravings, and Four of 8vo and 4to Plates. Price 10*l.* cl. ltrd.

In One Volume, 8vo., with upwards of 250 Engravings, price 1*l.* 10*s.*, and 3*l.* 6*s.* coloured,

REPTON'S LANDSCAPE-GARDENING: being the whole Works on Landscape-Gardening and Landscape-Architecture of the late Humphry Repton, Esq.; with a Biographical Notice, and Notes by J. C. Loudon, F. L. S., &c.

Complete in One Volume, price 2*l.* 10*s.*,

AN ENCYCLOPÆDIA OF TREES AND SHRUBS: being the Arboretum et Fruticetum Brittanicum Abridged, for the Use of Nurserymen, Gardeners, and Foresters.

In One Volume, 8vo., with upwards of 380 engravings, price 16*s.*

THE SUBURBAN HORTICULTURIST; or, an Attempt to teach the Science of Horticulture, and the Management of the Fruit, Kitchen, and Forcing Gardens, to persons who have had no previous Knowledge or Experience in these Departments.

In One Volume, 8vo., numerous Engravings, price 20*s.*,

THE SUBURBAN GARDENER AND VILLA COMPANION; comprising the Choice of a Suburban or Villa Residence, or of a situation on which to form one; the Arrangement and Furnishing of the House; and the Laying-out, Planting and General Management of the Garden and Grounds; the whole adapted for grounds from One Perch to Fifty Acres and upwards in Extent; and intended for the Instruction of those who know little of Gardening and Rural Affairs.

THE GARDENER'S MAGAZINE: any Number or Volume published subsequently to 1834 may be purchased separately. The Second Series, consisting of Six Volumes, from 1835 to 1840 inclusive, for 6*l.* 8*s.* 6*d.*; for 1841, 1*l.* 1*s.* 6*d.*; for 1842, 1*l.* 2*s.*

The Committee beg to add that purchasers will confer an additional benefit by sending their orders, accompanied by an order for payment in London, or at the Post Office, to Mrs. Loudon, Bayswater, Middlesex, or to either of the following addresses:—

Mr. Marnock, Royal Botanic Garden, Regent's Park.	Messrs. Warner and Warner, 28, Cornhill.
Mr. Charlwood, 14, Tavistock Row, Covent Garden.	Messrs. Drake and Bromley, 315, Oxford Street.
Mr. Henderson, Pine Apple Place, Edgeware Road.	Messrs. Minier, Adams and Nash, 63, Strand.

A List of purchasers will be published weekly in this Paper

Subscriptions will be received by the Treasurer, J. Cook, Esq., 40, Mincing Lane, London, and by the following Bankers:—Glyn and Co. Lombard Street; Sir John W. Lubbock, Bart. and Co. Mansion House Street; and Messrs. Coutts, Strand, London.

The following is a List of the present Subscriptions:

His Grace the Duke of Devonshire, President of the Horticultural Society	£25	0	0
James Cook, Esq.	20	0	0
Robert Midford, Esq., 44, Porchester Terrace	1	1	0
J. M. Blashfield, Esq.	5	5	0
Joseph Paxton, Esq.	10	0	0
Sir John W. Lubbock, Bart.	10	0	0
Messrs. Loddiges and Sons	20	0	0

Letters and Communications addressed to the House, 21, Regent Street, under cover to Mr. Drake, will receive immediate attention.

FOR OUT-OF-DOORS NATURALISTS.

Just published, price 1*s.*, No. XV. of

THE ZOOLOGIST, containing Popular Notices in Natural History, by Messrs. Greenwood, Jerdon, Doubleday, Fisher, Clifford (Rev. F.), Dawson (Rev. J. F.), Marshall, Bartlett, Gordon (Rev. Geo.), Wollaston, and many others; with figures of the new British Frog, the giant Perla, a singular variety of the Cabbage Butterfly, &c.

John Van Voorst, 1, Paternoster-row.

LECTURE ON THE HONEY BEE; containing its Natural History complete, and Domestic Management; and how to obtain pure honey without destroying the Bees.

By C. A. A. Lloyd.

Sold by Hamilton and Co., Paternoster-row, Price 3*d.*

An excellent Work to distribute among the Poor.

The following Periodical Works, for March 1844, will be published by CHARLES KNIGHT & Co.

OLD ENGLAND. Part IV., with a coloured Engraving. Price 1*s.* 6*d.* Published also in Weekly Numbers, at 3*d.*; with the Coloured Engraving as a Supplementary Number, price 6*d.*

THE PICTORIAL SUNDAY BOOK, Part III., with a Coloured Map, price 1*s.* 6*d.* Published also in Weekly Numbers at 3*d.*; with the Coloured Map, and a sheet of Letterpress descriptive of the Geography of the Holy Land, as a Supplementary Number, price 6*d.*

THE PENNY MAGAZINE, Part XXXVIII. of the New Series, price 6.

LONDON, Part XXXVI., price 1*s.* 6*d.*, completing the Work. Published also in Weekly Numbers, price 4*d.*

THE PICTORIAL MUSEUM OF ANIMATED NATURE, Part. XV., price 1*s.* Published also in Weekly Numbers, price 3*d.*

THE LIBRARY FOR THE TIMES. Monthly Series. OUR INDIAN EMPIRE. By C. MacFarlane. Vol. I., price 2*s.* 6*d.*, sewed; or, 3*s.* 6*d.* bound in cloth.

RE-ISSUE IN MONTHLY VOLUMES, OR SECTIONS OF COMPLETED WORKS.

On the 1st January 1844, these Works commenced to be re-issued in Monthly Volumes, or Sections, so as to enable new Subscribers, with a very moderate Periodical Outlay, to become possessed, within a short period, of Books which are universally acknowledged to be the best foundation of a private Library. All doubts of their proper completion, which too often apply to large Periodical Works, are now set at rest.

The Monthly Re-issue will be as follows, all the Volumes or Sections being strongly and elegantly sewed in a novel style:—

THE PENNY CYCLOPÆDIA. A Monthly Volume, at Six Shillings, completed, in 27 Volumes, in March 1846.

THE PENNY MAGAZINE, 1st Series. A Monthly Volume, at Four Shillings. Completed in 9 Volumes, in October 1844.

THE PICTORIAL BIBLE, and the HISTORY OF THE JEWS (including the Natural History of the Holy Land). A Monthly Section, including a portion of each Work, at Six Shillings. Completed in 12 Monthly Parts, in December 1844.

THE PICTORIAL EDITION OF SHAKSPERE, including the Biography. A Monthly Section at Six Shillings. Completed in 21 Monthly Parts, in September 1845.

The PICTORIAL HISTORY OF ENGLAND, to the conclusion of the Reign of George II. A Monthly Section at Six Shillings. Completed in 15 Monthly Parts, in March 1845.

THE PICTORIAL HISTORY OF ENGLAND during the Reign of George III. A Monthly Section at Six Shillings. Completed in 13 Monthly Parts, in December 1844.

ALSO, THE PICTORIAL HISTORY OF ENGLAND, during the Reign of George III. Vol. IV., super-royal 8vo., in cloth boards, price 20*s.* This Volume completes the Work. The previous Volumes may be had, price 20*s.* each.

LONDON. Vol. VI., price 10*s.* 6*d.* This Volume completes the Work. Any of the preceding Volumes may still be had price 10*s.* 6*d.* each.—22, Ludgate-street, Feb. 20, 1844.

TO NOBLEMEN, AGRICULTURISTS, and OTHERS.

ANALYSES of SOILS, MANURES, &c., are conducted by Mr. Mitchell, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, Victoria Cottages Hawley-road, Kentish-town. N.B.—A Vacancy now occurs for One House or Out-door Pupil.—Apply as above.

Just Published, Price 1*s.*,

PRACTICAL HINTS on New and Old MANURES. By John Doddridge Humphreys, Esq., Author of the "Electro-Physiology of Man," &c., &c. With an explanation of the Author's Discovery of the Governing Principles of Vegetable Growth; and full information as to the use and superior advantages for Wheat, Barley, Turnips, &c., of the New Manure called "HUMPHREYS'S FARMERS' COMPOUND," as manufactured at 12*s.* per cwt. by Messrs. Davy, Mackmurdo, and Co., 100, Upper Thames-st., London.

Longman, Brown, Green, and Longmans.

NEW METHOD OF TRANSPLANTING.

This day, 8vo, with Illustrative Plate, 7*s.*

THE TREE-LIFTER; or, a New Method of Transplanting Trees. By Colonel George Greenwood.

London: Longman, Brown, Green, and Longmans.

BLACK ON BREWING—THIRD EDITION.

Published this day, Third Edition, 8vo, 10*s.* 6*d.*,

A PRACTICAL TREATISE on BREWING, based on Chemical and Economical Principles; with Formulæ for Public Brewers, and Instructions for Private Families. By William Black. Third Edition, revised and corrected, with considerable Additions. The Additions revised by Professor Graham, of the London University.

London: Longman, Brown, Green, and Longmans.

Post Octavo, 5*s.*

PRACTICAL CHEMISTRY for FARMERS and LANDOWNERS. By Joshua Trimmer, F. G. S.

By the same Author, 8vo. with Two Hundred Illustrations, 12*s.*

PRACTICAL GEOLOGY and MINERALOGY, and the CHEMISTRY of METALS, with an Introductory Discourse on the Nature, Tendency, and Advantages, of Geological Pursuits.—London: John W. Parker, West Strand.

Price 6*s.* 6*d.*, cloth, gilt edges,

MRS. LOUDON'S LADIES' COMPANION to the FLOWER-GARDEN. Being an Alphabetical Arrangement of all the Ornamental Plants usually grown in Gardens and Shrubberies; with full directions for their Culture.

London: Published by William Smith, 113, Fleet-street.

BOTANICAL & GARDENING WORKS

PRINTED FOR

LONGMAN, BROWN, GREEN, & LONGMANS

THE THEORY OF HORTICULTURE; or, an Attempt to explain the Principal Operations of Gardening upon Physiological Principles. By John Lindley, Ph.D., F.R.S. 8vo. Illustrations on Wood. 12*s.* cloth.

INTRODUCTION TO BOTANY. By Professor J. Lindley, Ph.D., F.R.S. Third Edition, with Corrections and considerable Additions. 8vo. Six Plates and numerous Woodcuts, 18*s.*

A NATURAL SYSTEM OF BOTANY; or, a Systematic View of the Organization, Natural Affinities, and Geographical Distribution of the whole Vegetable Kingdom; together with the uses of the most important species in Medicine, the Arts, and Rural or Domestic Economy. By John Lindley, Ph.D., F.R.S. Second Edition, with numerous Additions and Corrections, and a complete List of Genera, with their Synonyms. 8vo. 18*s.*

SCHOOL BOTANY; or an Explanation of the Characters and Differences of the principal Natural Classes and Orders of Plants belonging to the Flora of Europe, in the Botanical Classification of De Candolle. For the use of Students preparing for their matriculation examination in the University of London and applicable to Botanical Study in general. By John Lindley, Ph.D., F.R.S., Fcp. 8vo., with upwards of 160 Woodcuts, 6*s.*

A SYNOPSIS OF THE BRITISH FLORA, arranged according to the Natural Orders. By Professor John Lindley, Ph.D., F.R.S., &c. The Third Edition, with numerous Additions, Corrections, and Improvements, 12mo. 10*s.* 6*d.*

GUIDE TO ORCHARD AND KITCHEN GARDEN; Or, an Account of the most valuable Fruits and Vegetables cultivated in Great Britain: with Kalendars of the Work required in the Orchard and Kitchen Garden during every month in the year. By George Lindley, C.M.H.S., Edited by Professor Lindley. 8vo. 16*s.*

AN ENCYCLOPÆDIA OF GARDENING; presenting in one systematic view, the History and Present State of Gardening in all Countries, and its Theory and Practice in Great Britain, with the Management of the Kitchen Garden, the Flower Garden, Laying out Grounds, &c. By J. C. Loudon, F.L.S., &c. New Edition, enlarged and much improved. 8vo. With nearly 1,000 Woodcuts, 2*l.* 10*s.*

AN ENCYCLOPÆDIA OF PLANTS; including all the Plants which are now found in, or have been introduced into Great Britain; giving their Natural History, accompanied by such descriptions, engraved figures, and elementary details, as may enable a beginner, who is a mere English reader, to discover the name of every Plant which he may find in flower, and acquire all information respecting it. New Edition, with a Supplement. By J. C. Loudon; W. H. Baxter, Jun.; George Don, F.L.S.; and J. D. C. Sowerby, F.L.S. 1 vol. 8vo. with nearly 10,000 woodcuts, 3*l.* 13*s.* 6*d.*

HORTUS BRITANNICUS; a Catalogue of all the Plants indigenous to, or introduced into Britain. Third Edition, with a New Supplement, prepared, under the direction of J. C. Loudon, by W. H. Baxter, and revised by George Don, F.L.S. 8vo. 31*s.* 6*d.* The First Supplement, separately, 2*s.* 6*d.*, the New Supplement, separately, 8*s.*

THE ROSE AMATEUR'S GUIDE; containing ample Descriptions of all the fine leading varieties of Roses, regularly classed in their respective families; their History, and Mode of Culture. By T. Rivers, Jun. Third Edition, corrected and improved. Fcp. 8vo. 6*s.*

THE TREE-LIFTER; or, a new Method of Transplanting Trees. By Colonel George Greenwood. 8vo. with illustrative Plate. 7*s.*

A SCRIPTURE HERBAL. With upwards of 120 Wood Engravings. By Lady Callcott. Square crown 8vo. 1*l.* 5*s.*

CONVERSATIONS ON BOTANY. Ninth Edition, improved, fcp. 8vo., with 22 Plates, 7*s.* 6*d.*; with the Plates coloured, 12*s.*

THE PRINCIPLES OF DESCRIPTIVE AND PHYSIOLOGICAL BOTANY. By J. S. Henslow, M.A., F.L.S., &c. Fcp. 8vo. with Vignette Title, and nearly 70 Woodcuts, 6*s.*

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS. By Clement Hoare. Third Edition, 8vo. 7*s.* 6*d.*

AN INTRODUCTION TO THE STUDY OF BOTANY. By Sir J. E. Smith, late President of the Linnean Society. Seventh Edition (1833), corrected; in which the object of Smith's "Grammar of Botany" is combined with that of the "Introduction." By Sir William Jackson Hooker, K.H., LL.D., &c. 8vo. 36 Steel Plates, 16*s.*; with the Plates coloured, 2*l.* 12*s.* 6*d.*

THE ENGLISH FLORA. By Sir James Edward Smith, M.D., F.R.S., late President of the Linnean Society, &c. 6 vols. 8vo. 3*l.* 12*s.*

CONTENTS:

Vols. I. to IV. The Flowering Plants and the Ferns, 2*l.* 8*s.*

Vol. V. Part 1, 12*s.*—Cryptogamia; comprising the Mosses, Hepaticæ, Lichens, Characeæ, and Algæ. By Sir W. J. Hooker.

Vol. V. Part 2, 12*s.*—The Fungi—completing the work, by Sir J. W. Hooker, and the Rev. M. J. Berkeley, F.L.S., &c.

COMPENDIUM OF THE ENGLISH FLORA. By Sir J. E. Smith. Second Edition, with Additions and Corrections by Sir W. J. Hooker. 12mo. 7*s.* 6*d.*

THE SAME IN LATIN. Fifth Edition, 12mo. 7*s.* 6*d.*

THE BRITISH FLORA. In Two Vols. Vol. I., comprising Phænogamous or Flowering Plants and the Ferns. By Sir William Jackson Hooker, K.H., LL.D., F.R.A., and L.S. &c. &c. &c. Fifth Edition, with Additions and Corrections; and 173 Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. 8vo. with 12 Plates, 14*s.*; with the Plates coloured, 24*s.*

Vol. II. in Two Parts, comprising the Cryptogamia and Fungi, completing the British Flora, and forming Vol. V., Parts 1 and 2, of Smith's English Flora, 24*s.*

THE VEGETABLE CULTIVATOR; containing a plain and accurate Description of all the different Species of Culinary Vegetables, with the most approved Method of Cultivating them by Natural and Artificial Means, and the best Modes of Cooking them; with a Description of the Physical Herbs in General Use. By John Rogers, Author of "The Fruit Cultivator." Foolscap 8vo. 7*s.*

SATURDAY, FEBRUARY 24, 1844.

ARGUS LIFE ASSURANCE COMPANY, 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.

Thomas Farncomb, Esq., Alderman, *Chairman.*
William Leaf, Esq., *Deputy-Chairman.*

William Banbury, Esq.	Rupert Ingleby, Esq.
Edward Bates, Esq.	Thomas Kelly, Esq., Alderman.
Thomas Camplin, Esq.	Jeremiah Pilcher, Esq., Sheriff of London and Middlesex.
James Clift, Esq.	Lewis Pocock, Esq.
Rt. Hon. J. Humphery, M.P., late Lord Mayor of London.	

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 16 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.

DIRECTORS.

E. Barnard, Esq., F.R.S.	Gideon Colquhoun, Esq.
Robert Brooks, Esq.	C. E. Mangles, Esq.
Henry Buckle, Esq.	Richard Onslow, Esq.
John Henry Capper, Esq.	William Walker, Esq.

BANKERS.—Union Bank of London.
COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2. Moorgate-street.
PHYSICIAN.—Patrick Fraser, Esq., M D., No. 62, Guildford-st.
SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

MUTUAL LIFE ASSURANCE SOCIETY, No. 37, Old Jewry, London.—Established 1834.

ACTUARY: Peter Hardy, Esq., F.R.S.

Extract from the Report of the Directors of the Society, to a General Meeting of the Members, holden the 17th January, 1844:

"At the end of the six years which have been completed since the 31st of December, 1837, there are in existence in the Society three times as many policies as there were in existence at the end of the year 1837. The capital sums assured under these policies are nearly doubled in amount. The corresponding income derived from annual premiums is also nearly doubled. The accumulated property of the Society is four times as great as it was at the end of that year, and the present divisible surplus is nearly six times as much as that declared in the division of the year 1837."

The Directors invite the public to compare the following Table of the Additions made to the Ten oldest existing Policies in the Society, up to the 31st of December, 1843, with the additions made by other Societies within the same time:—

1834, Policy No.	Sum Assured.	Premium.	Age at Admission	Total Addition made in 1842.	Increase, 1843.	Total Addition made in 1843.	Amount of Premiums paid.	The total addition is equivalent to the following per centage on the amount of premiums paid.
	£	£ s. d.		£ s. d.	£ s. d.	£ s. d.	£ s. d.	
1	1000	24 0 0	29	146 12 0	24 4 0	170 16 0	280 0 0	61

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death*.

A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

PROVIDENT LIFE OFFICE, 50 REGENT STREET, FEB. 15, 1844.

BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office, bearing date prior to the year 1834, may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued.

GEORGE BEAUMONT, *Actuary.*

News of the Week.

THE long-protracted debate on the state of Ireland, which commenced on Tuesday the 13th, has continued without intermission during every night of the past week. The speech of Lord Stanley on Friday night called forth a reply on Monday from Mr. John O'Connell, who, as one of the traversers in the recent trials, abstained from comment on the judicial questions connected with them, but dwelt at some length on the policy of Government and on the general grievances of Ireland. Mr. Macaulay followed on the same side in a speech remarkable for its historical research, and Sir W. Follett occupied the remainder of the sitting by a vindication of the Government in the management of the trials. On Tuesday night, the most important speech was that of Sir Thomas Wilde, who addressed himself to the technical and legal questions connected with the trials and to the manner in which they were conducted by the law-officers of the Crown. On Wednesday the Irish Attorney-General replied to the charges brought against him by Sir T. Wilde, and occupied the entire sitting by a minute account of the prosecutions, vindicating the Government from the imputations thrown upon it in the case of the Jury List, and apologising for the indiscretion into which he had personally fallen in sending a challenge to Mr. Fitzgibbon. On Thursday Mr. Sheil replied to the speech of the Irish Attorney-General, entering in detail into the numerous questions at issue, and giving his version of the State Trials from their commencement to their close. Last night the legal points adverted to by Mr. Sheil were answered by Sir F. Pollock, after which Mr. O'Connell and Sir R. Peel spoke at great length. Lord John Russell replied, and at half-past three the house divided, when there were for Lord John Russell's motion 224, against it 325. Majority for Ministers 101.

From France we have accounts of the occupation of Otaheite by the French Rear-Admiral, who has deposed Queen Pomaré, and taken possession of Otaheite in the name of King Louis-Phillippe, on the pretence of some infraction of the treaty by which France agreed to afford protection to that island. The news of this proceeding has been welcomed in Paris by the Opposition Papers as a grand stroke of policy, while the Ministerial Journals take no official notice of the circumstance. It will be seen, however, by our Parliamentary report, that Lord Aberdeen and Sir R. Peel regard the intelligence with regret, and that the English Cabinet have reason to believe that the transaction has taken place without the previous sanction instruction of the French Government.

Home News.

COURT.—Her Majesty and Prince Albert remain at Windsor Castle in strict seclusion. During the week they have taken daily exercise on foot or in a pony-carriage, and have visited the Duchess of Kent at Frogmore. On Wednesday, being Ash Wednesday, Her Majesty, the Prince, the Duchess of Kent, and part of the household suite attended divine service in the private chapel of the Castle. Prince Albert has been engaged several hours during the last week in selecting and arranging in the private and State apartments between two and three hundred Crown pictures, which have been brought from the late Mr. Seguier's stores at Hampton Court, from Cumberland Lodge, and the Star Chamber. His Royal Highness having selected four portraits of the House of Brunswick, they are now placed in the Queen's drawing-room, and it is expected that the State apartments will not be opened to the public until the Prince has completed his selection.

Parliamentary Movements.—Capt. Peel Dawson, nephew of Sir R. Peel, the conservative candidate for the representation of Londonderry, has retired in consequence of the determination of Sir R. Bateson, Bart., of Castruse, to bring forward his second son, Lieut. Bateson, of the 13th Light Dragoons, as successor to his brother, the late member, who died of malignant fever at Jerusalem, on Christmas-eve.

The Duke of Wellington.—A paragraph appeared in the *Sun* newspaper a few nights since, stating that the Duke of Wellington on his arrival at Apsley House on Wednesday, was observed to fall down upon the neck of his horse, that two gentlemen passing ran to his assistance and he was conveyed in their arms into Apsley House in a state of total unconsciousness. The paragraph was copied into the *Times* of the next day, and called forth the following characteristic note from the Duke himself:—"London, Feb. 16, 1844.—Field-Marshal the Duke of Wellington presents his compliments to the editor of the *Times* newspaper. It will save the Duke some trouble if the editor will be so kind as to announce that there is not one word of truth in a paragraph of the *Times* newspaper of this 16th inst., headed 'The Duke of Wellington.' The Duke has not been in better health for the last 20 years than at present. He was not on horseback on Wednesday. He went and returned from the Horse Guards on foot through the street, followed by his groom with his horse, which was not mounted on that day." The *Times* adds the following note:—"The paragraph was copied from an evening paper, and is manifestly one of those vile fabrications by which the press is occasionally duped. We cannot, however, in this case regret the error, as it has elicited from the illustrious Duke so gratifying an assurance upon a point which must be one of interest to all."

Foreign.

FRANCE.—The leading news in the French papers is an announcement from Havre, stating that the Elizabeth, whaler, which has arrived in ninety days from Otaheite, brings intelligence that the French, on pretence of some infraction of the treaty, by which it agreed to afford protection to that island, had deposed Queen Pomare, and that the French Rear-Admiral Dupetit Thouars had taken possession of Otaheite in the name of the King of the French, and hoisted the national flag in token of sovereignty. The ministerial *Journal des Débats* publishes a long narrative of the occurrences which have led to the downfall of Queen Pomare, derived from a person on board one of the frigates which have effected the conquest. This letter states that the Admiral, on the 5th November, twice waited on Pomare, gave her a respite of four hours, but the delay yielded no concession. At a quarter past twelve the Society Islands were French, the English Consul lowered his flag an hour after, and the Queen, who had concealed herself at his house the day before, sought an asylum on board the Dublin frigate. A subsequent letter says that if the English had attempted to prevent the French Admiral from taking possession of the Society Islands, they would have been occupied by force. The ex-Queen is stated to have first retired to the English Consul's house, and Mr. Pritchard's conduct is subjected to the severest animadversion. The Paris papers in general approve of the step taken by Admiral Thouars, and consider the whole affair as a grand stroke of policy. The only two papers which appear to have any doubt on the matter are the *National* and the *Siècle*, the former of which hopes that good faith has been observed by the protectors towards the protected, and the latter fears that the affair will bring the Government into collision with England.—The desultory discussion on the Game Bill, which had occupied ten sittings of the Chamber of Deputies, ended on Monday. In this Bill, which has already passed the Peers, various material changes have been made, some of which have been resisted, and others acquiesced in by the Cabinet. The most remarkable alteration was effected on Monday. The last article of the Bill exempted from its provisions the Crown property, though the penalties enacted by it were to be enforced against trespassers on the Royal domains. Against this privilege the Opposition declared, and the article was rejected by a considerable majority. Upon this hostile decision being come to, Ministers are stated to have retired from the hall, leading away a large number of their voters, and the consequence was that the ballot on the whole Bill could not take place. The Opposition prints indulge in speculations as to the course which the Ministry will pursue after a check which must be so offensive to the Court, but it may be inferred from the language of the ministerial papers that they will nevertheless persist in passing the Bill. The Chambers, owing to the *Mardigras* festivities, adjourned to Wednesday, when the ballot was to take place.—Queen Maria Christina arrived on Saturday at Châlons, where she slept. She embarked next day for Lyons on her way to Spain, receiving Royal honours throughout her journey.—The re-election of the Legitimist deputies who resigned appears to create considerable interest. The election will take place in a fortnight. The Government has used all its influence at Marseilles to prevent the return of M. Berryer; and M. Pascal, a rich and influential banker at Marseilles, was announced as the Government candidate. It appears however that upon feeling the ground, M. Pascal thought it not prudent to offer himself, and M. Berryer will therefore be re-elected without opposition. The only Legitimist elections which are doubtful are those of M. de Larcey and M. Blin de Bourdon.

SPAIN.—Accounts from Madrid of the 13th inst. state that General Roncali had refused to shoot the thirty insurgents taken prisoners at Alcoy, and would, it was believed, be superseded in his command by General Cordova for his disobedience. Additional arrests had taken place, but the Count de las Nevas and several officers of the National Guards, against whom warrants had been issued, had escaped the search of the police. Several

Senators and about seventy Deputies of the former majority had signed and presented an address to the Queen, in which they expressed their unalterable devotion to the Throne, and condemned the Alicant and Carthagena insurrection. The Grandees of Spain have also presented a similar address. The Senators and Deputies had likewise voted an address to the Queen-Mother, and deputed Messrs. Carriquiri and Vilches to compliment Her Majesty in their name on her arrival in Spain. The prisoners were still in solitary confinement. The Political Chief of Murcia had written to the Minister of the Interior, that the insurgents of Carthagena had retired from Murcia, carrying off all the public monies, together with large sums exacted from the wealthy inhabitants of the place. The reported defeat of Bonet, the insurgent leader, turns out to be untrue. It appears that a party of the insurgents was defeated and some prisoners made, but those insurgents came from Murcia, not from Alicant, and Bonet was not present at that affair. Another battle, however, took place afterwards between the Alicant Carabineers, under Bonet himself, and General Pardo, in which General Pardo was defeated, and Bonet succeeded in taking 160 prisoners, and re-taking the cannon which had previously been captured from the Murcia insurgents. Despatches had reached the capital from Seville, stating that two battalions of the National Guard of that city had resisted the order for their disarmament, and that great excitement and disorder prevailed there.

PORTUGAL.—We have advices from Lisbon to the 13th instant. The 60 dragoons who had revolted at Torres Novas had proceeded to Castello Branco, the chief town of the province of Lower Beira, about 80 miles from Lisbon, and had there gained over another detachment of the same regiment of Dragoons, 40 in number, and 400 men of the 12th Regiment of Infantry, with their officers. The insurgents were therefore 500 strong, but the revolt was purely military, and from no part of the kingdom had the slightest echo arisen. The insurrection was then ten days in existence, and not a town or village in all Portugal had pronounced against the Government. The insurgents, in fact, were treated by the people everywhere with profound indifference. Baron Leiria with his column had arrived at Abrantes, within a few leagues of Castello Branco, and troops were likewise marching against the insurgents from Estremoz and Chaves. A crisis must speedily ensue, and there seemed to be little doubt that the insurgents would in a few days be compelled to retreat across the Spanish frontier. Count Bomfim had failed in his attempt to produce insurrection in the garrison of Elvas and had been arrested at that place. Other arrests had been made at Lisbon, including some leading Opposition Deputies. Even at Castello Branco the people took no part in the insurrection, and the telegraph announced tranquillity in every direction. M. Olozaga has been ordered to reside at Setubal.

GERMANY.—Letters from Posen of the 4th inst. state that orders have been received from Berlin for all Polish emigrants who took part in the revolution to quit Prussia within a fortnight. In this order it is positively declared that no petitions for a mitigation of the measure will be attended to. Only those who find it absolutely impossible to settle their affairs will be allowed to remain a fortnight longer. This measure will severely affect many emigrants who have resided for years in the Duchy. Many have been received into the families of Prussian subjects, others have acquired landed property, which they will now be obliged to sell at any price, though notice was given to all of them, both on their arrival in Prussia and when they made purchases of landed property, that they could not by that means acquire any right of settlement in Prussia. —The opening of the railway from Bonn to Cologne took place on the 14th. The ceremony was performed with all the formalities appropriate to such occasions, the passage being accomplished in the space of fifty minutes. The regular traffic of the line was to commence on the following day.—The papers state that negotiations are pending between Austria and France for the conclusion of a treaty of commerce. For this purpose the tonnage duties are to be reduced in order to facilitate the entrance of Austrian produce into France.

SWEDEN.—By the last advices from Stockholm the King of Sweden, who had been considerably better, has again had a partial relapse. In consequence of the progressive improvement in the King's health previous to this change the prayers in the Palace Chapel were discontinued, and a Royal ordonnance was issued conferring the full exercise of the royal authority on the Crown Prince. The King signed with his own hand both this ordonnance and a similar one for Norway.—On the 9th he was suffering from severe pains in his foot and his sleep was much disturbed.

ITALY.—Several distinguished prelates of the Roman Catholic Church have died recently in Italy. The *Journal des Débats* announces the death, at Rome, on the 31st ult. of Cardinal Bussi, Archbishop of Benevento. He was born at Viterbo, on the 29th January, 1755, and received the Roman purple from Leo XII., in 1824. A letter from Naples, of the 1st, announces the death of Cardinal Caracciolo, archbishop of that city. Cardinal Spada, who died at Rome a short time ago, has left a sum equalling 54,000*l.* to the brotherhood of charity to which he belonged, to be employed in defending the poor, and particularly working men, when brought before the tribunals.—A letter from Rome states that the director of the police of Ravenna was shot dead in the streets on his way to the theatre. At Cesena the play-house was blown up, at a moment when it was fortunately empty; and at Castel Bolognese several gendarmes had been murdered. —According to a letter from Naples, of the 20th ult., the borders of the crater of Mount Etna have become considerably extended. Of the five new craters that had been formed, two were still smoking, and from the southernmost small flames were to be seen issuing in the night. From the furthest to the eastward thick columns of smoke were emitted, and clothed the slope of the mountain as with a shining mantle of snow. Hence it is inferred that the volcano is not extinguished, and that there may still be some disastrous eruptions.

RUSSIA.—A letter from St. Petersburgh of the 30th ult. states that an ukase had just been issued by the Emperor declaring that the Roman Catholic clergy of the western provinces of the empire should be paid by the State after the 1st of May next. The ukase divides the Catholic parishes into five classes. The pastors included in the first are to receive an annual salary of 600 silver roubles (100*l.*), and those of the last class of 230 roubles (37*l.*). An imperial ukase has been received in Lithuania directing the authorities of towns and other localities inhabited by Jews to transport those unhappy persons, amounting to 36,000 families, to a distance of 12 leagues from their several actual places of residence. This ukase was to receive its execution before the 18th inst.

TURKEY.—Letters from Constantinople of the 27th ult. mention the arrival of Mr. Curzon from Erzeroum, where he had suffered very much in his health. The Capitan Pasha had offered a verbal apology to Sir Baldwin Walker for the uncourteous manner in which he had been dismissed. The Porte was about to adopt stringent measures in Albania, to quell the spirit of revolt in that province and in Bosnia. Accounts from Bucharest of Jan. 3 state that "Measures are beginning to be taken in Moldavia and Wallachia against the increase of the Jews. A list has been drawn up of all those who cannot furnish proof of their means of existence, with a view to transport them beyond the frontiers. In Moldavia where there are a greater number of Israelites, an ordonnance has been published to remove them from the principal roads. They are not allowed to take on a lease houses situated along those roads, and the agreements made before the publication of the ordonnance are to be in force for only three years. The houses now in construction can only be inhabited by Christians, and in case of sale it is only Christians who can purchase them. No Jew can take a Christian into his service, and all who do not exercise some regular calling and who cannot prove that they possess a fortune of five thousand piasters will be treated as vagabonds."

UNITED STATES.—The Royal mail steamer Britannia arrived at Liverpool on Sunday evening. Frost had set in with great severity, and the Britannia was detained at Boston in consequence until the 3d inst. The harbour being frozen up, it was necessary to cut a canal through the ice for her outlet. As this work had to be constantly kept open by incessant labour for a line of six or seven miles, it occupied a considerable time to get it ready. She experienced very tempestuous weather between Boston and Halifax, so much so as to make it the 6th inst. before she reached the latter port, and though the mail was put on board she was unable to start until the 7th. She has since then made a very successful homeward voyage, and the passengers, nearly 70 in number, have expressed themselves highly satisfied with her performance. The news by this arrival is barren of interest, being almost confined to details of the severity of the weather. In Congress the Chairman of the Committee on Foreign Affairs (Mr. C. J. Ingersoll), to which had been referred a resolution to notify the British Government "to annul the joint occupation of the Oregon territory by the United States and England," reported to the House of Representatives "that it is not expedient to interfere in the matter at the present time;" the meaning of which is, that it would be desirable to await the commencement at least, if not the issue of the expected negotiations with Mr. Packenham, the new British Minister. The report having been duly read, Mr. Owen, son of Mr. Robert Owen of Lanark, moved as an amendment to insert instead of the words "it is not expedient," the words "it *is* expedient." Mr. Owen contended that it was ridiculous for the United States to negotiate in the matter as Great Britain had not the shadow of a claim to the territory, and strongly urged immediate hostilities with this country. A disgraceful scene had taken place on the floor of the House of Representatives. Mr. Weller, a Member from Ohio, attacked Mr. Shriver, of Baltimore, and gave him a violent beating, in consequence of something Mr. Shriver had written in the *Baltimore Patriot*. This outrage was perpetrated near the Speaker's chair a few moments before the hour of meeting.

WEST INDIES.—By the Royal mail steamer we have accounts from Jamaica and Antigua Jan. 24th, Barbadoes Jan. 21st, St. Lucia and St. Vincent's Jan. 26th, St. Kitt's Jan. 27th, and Dominica Jan. 28th.—In Jamaica complaints are made of excessive drought in Manchester and Elizabeth, and so scarce was water that the wants of the population could not be properly satisfied. The corn crops had failed, and provisions were advancing in price. Much distress prevailed, and should the dry weather continue great fears were entertained for the result. Fever and dysentery had been rather on the increase of late, and the appearance of the small-pox in some of the other islands had caused the Cuban authorities to declare a quarantine of seven days against all vessels entering their port from the West Indies, Porto Rico excepted. With respect to business at Jamaica, it is represented as exceedingly dull, and money is stated to be scarce. The weather at Barbadoes had been very oppressive till within a few days of 20th ult, when a change took place, and cold and chilly winds were experienced, and then the shock of an earthquake was felt, which being a severe one, although doing no damage, spread a good deal of alarm throughout the colony. Rain had followed, which it was hoped would do some good to the plantations, and prepare the ground for agricultural operations.—The shock of an earthquake had been felt in St. Vincent's, St. Lucia, Dominica, and the neighbouring islands, but without serious effect. At St. Lucia the weather was highly favourable to the crops, though not so favourable for road-making. The planters of Dominica had commenced cutting their canes, the yield of which was superior to previous years, while the season was fine and the sugar manufactured of good quality.—At Trinidad a vessel had arrived with 216 emigrants from Rio de Janeiro, 93 of whom were women, and all being young and in health, they found when landed immediate employment. Another vessel with 300 more was shortly looked for from the same quarter.—The Antigua papers mention that a thick vein of coal had been discovered on the estate of John Mickleth waite, Esq., of Ardley, at the extraordinary depth of 300 yards. The fever which had been raging for some time at St. Christopher's had at length subsided. In consequence of the severe illness of the Lieutenant-Governor Sir Charles Fitzroy, the Governor-in-Chief had postponed his tour through the several islands of his Government.

Parliament.

HOUSE OF LORDS.

Friday.—On the motion of the Marquess of NORMANBY, leave was given to Peers, until Monday, to sign a protest against the resolutions respecting Irish affairs which were rejected on Thursday week.—Lord DENMAN took occasion to contradict a supposed dictum reported to have been uttered by him on the bench, and quoted by Mr. Ferrand in a notice placed on the vote papers of the House of Commons, to the effect, that there are some cases in which it is necessary to break in upon Acts of Parliament, and upon that law which may have existed from all time. His Lordship emphatically denied having ever propounded such a monstrous doctrine, which could only have gained currency as coming from his lips through the complete misapprehension of his meaning by the gentleman who reported the judgment in which the misconception arose.—Lord BROUGHAM presented a petition from the Earl of Dundonald, more generally known as Lord Cochrane, praying an extension of the patent which he has already obtained for his valuable invention for applying a rotatory motion to steam-engines Lord Brougham, after detailing the many scientific discoveries made by the gallant Earl's father, at a vast expense of time, labour, and money, of which discoveries the public are now the sole patentees, called to memory the brilliant services of the present Earl, and asked their Lordships, as a matter of justice, that, as in the case of Mr. Watt, an additional period might be granted Lord Dundonald, without which his patent would be of no avail to him, and all his labour, perseverance, and discovery, would be absolutely lost.—The Earl of HADDINGTON expressed his full concurrence in Lord Brougham's sentiments, and with regard to Lord Dundonald as a Naval officer, there could be but one opinion, and that was, that he was one of the most gallant, daring, and skilful officers that ever walked the quarterdeck of a man-of-war. His invention was a most important one, and in bringing it to perfection he had received every assistance from the present Board of Admiralty. He agreed also, that if his patent were not extended, it would be impossible for him to receive any remuneration. The Admiralty had shown their opinion of the invention by entrusting Lord Dundonald with the building of a ship-of-war in which his invention would be tried. The Noble Inventor believed that his invention could be applied to every ship, and if this should be so, then it would be the perfection of the application of steam to naval purposes. The petition was laid on the table.—After some remarks on the Irish Church by Earl FITZWILLIAM, a bill to indemnify witnesses who would give evidence to the committee on the Gaming Laws, was read a first time, on the motion of the Duke of RICHMOND.

Monday.—Lord BROUGHAM brought in a bill to give authority to the Committee of Privy Council to further extend the period assigned to a patent conferred by the Act of 1835.—Lord CAMPBELL suggested the propriety of embracing in the bill clauses granting a power to the Committee of Privy Council to divorce *a vinculo matrimonii*.—The LORD CHANCELLOR objected to the project of mixing together in one bill two subjects so dissimilar as the law of patents and divorce.—After three or four speeches from Lord BROUGHAM and Lord CAMPBELL, the bill was read a first time; Lord BROUGHAM promising to draw up a special bill to deal with the question of divorces.—On the motion of the Duke of BUCCLEUCH, the Metropolitan Improvements Bill was read a third time and passed.—To a question from Lord RODEN, the LORD CHANCELLOR replied that judgment would be given on Friday night in the appeal before their Lordships regarding Presbyterian marriages in Ireland.—Upon a motion made by Lord MONTEAGLE for returns touching the best and speediest line of communication between England and Ireland, the Duke of WELLINGTON remarked that Government were fully impressed with the necessity of doing all in their power to forward that object.

Tuesday.—The Witnesses Indemnity Gaming Bill was read a third time, and the Offences at Sea Bill passed through Committee.—On the motion of Lord CAMPBELL, the law of Defamation and Libel Amendment Bill was read a second time and referred to the same Committee which sat on this subject last session.

Thursday.—The Earl of ABERDEEN stated, in reply to a question from Lord BROUGHAM, that he believed the reports which appeared in the public journals respecting the late occupation of Otaheite by the French were perfectly correct, and added that he had heard of the event with great regret; but as he had not had time to communicate with the French Government on the subject, he was unprepared with such explanations as would satisfy their Lordships.—Lord BROUGHAM expressed his deep sorrow at the occupation itself, but more at the tone of triumph over this country adopted by the French Journals in announcing it.—The Offences at Sea Bill was read a third time and passed.—Lord MONTEAGLE moved for returns relating to the appointment of the Rev. Holt Waring to the Deanery of Dromore, which led to a desultory discussion on the character of that gentleman, as an Orange partisan.—Lords RIPON and WHARNCLIFFE, and the Duke of WELLINGTON, deprecated the attempt to run down a man for something said or done nineteen years ago; and the Marquess of WESTMEATH made a personal attack on Lord Monteagle, expressing his belief that the name of Mr. Holt Waring would sound as well in connection with, a sinecure as that of Spring Rice under a Peerage, and an office of 2000*l.* a year.—The Duke of RICHMOND interfered and called upon their Lordships, if they wished to retain the respect of the country, to keep their tempers, and above all, to abstain from the use of personalities—the bad effects of which had been seen a few evenings ago in the case of Lord Brougham and Lord Campbell.—The Marquess of WESTMEATH then apologised, and the returns were ordered.

Friday.—The Bishop of EXETER presented petitions praying that religious instruction might be better administered in the poor law unions of England and Wales. The rev. Prelate then moved for the appointment of a Committee on the subject. In doing so he said, that he thought the country was entitled to have a full investigation of the facts which he would lay before the House. He by no means charged all the Poor-law unions of the

Kingdom with spiritual destitution, but he enumerated several unions in which he knew that spiritual consolation was lamentably deficient.

HOUSE OF COMMONS.

Friday.—The adjourned Debate on Ireland was commenced by Capt. BERNAL in support of Lord J. Russell's motion.—Mr. WARD and Mr. Serjeant MURPHY followed on the same side, and Mr. DISRAELI and Col. CONOLLY spoke against it.—Mr. C. BULLER said it was a frightful idea that the vast mass of the Irish people were in a state of complete alienation from this country, and that we could only retain the country in the same way that Austria holds Lombardy, or Russia Poland. It was an alienation of race and religion; and even a dense sluggish mass of six millions of discontented people would be a formidable difficulty to any Government. Nothing but a bold reform of the dominant church could possibly pacify Ireland; and if the Government would honestly undertake it, the prejudices of the people of England would be overcome, and a great step made towards the material prosperity of Ireland.—Lord STANLEY said he did not deny that Lord John Russell had made a very dexterous opposition motion, and very clever opposition speech. Under the convenient form of a proposition for a committee of the whole House, which he would not have made if he had not known it would be rejected, he couched an attack on the Administration, while at the same time he afforded a pretext for working on the passions of the Irish people by fresh allegations of insult and wrong. He looked upon the state of Ireland with apprehension; and he knew no more tremendous responsibility than that assumed by the members of the late Government in identifying themselves with an agitation so alarming, at the very moment when the Government had succeeded in vindicating the ordinary operation of the law, by convicting the leader of a movement through which the passions of the people were exasperated to madness, and the country placed in imminent peril. Had the Government resorted to extraordinary powers? Had they strained any law? On the contrary, this arbitrary and despotic Government had maintained in Ireland, up till 1843, a lower military force than in any previous year since the Union. But with 1843 commenced that pernicious agitation which, with its multitudinous meetings and appeals to physical force, left the Government no alternative but to increase the military in Ireland to an extent not only sufficient to repress outrage, but overawe insurrection. Had they not done so, they would have deserved impeachment. They interfered—too early or too late—but successfully, and without the exercise of any but the ordinary powers of the law. But they were accused of tampering with the jury list, and of striking off Roman Catholics. The names dropped turn out to be only 24, and the cause of it an accident in the hands of the registrar—himself a Catholic; and the Catholics challenged in the exercise of an imperative duty have been proved by an affidavit of the Crown Solicitor to be all Repealers. Chief Justice Pennefather had been most indecently attacked. Why? Had he misdirected the jury on a point of law? Was not the bench unanimous? Had not the jury clearly discriminated in their verdict as to the guilt of the different traversers? They had manifested their respect for the sanctity of an oath, and had vindicated the Government and the law by bringing the leaders of a dangerous conspiracy to the bar of judgment. Giving some explanations about his conduct when in opposition with respect to his Registration Bill, he passed to the subject of the Irish Church. Was there, he asked, to be no peace in Ireland unless it were subverted? If Lord John Russell were in power to-morrow, he dare not, could not, and would not attempt to give effect to "abstract" declarations made at a time so exciting as this. He concurred with Lord Howick—the time for compromise was gone by; and the question now was, will you or will you not destroy the Established Church, secured as it was by statute, settlement, and the repeated solemn disclaimers and assurances of the Roman Catholics themselves? Citing some of these assurances, and reading that portion of the oath by which Roman Catholic members of the Legislature bind themselves not to subvert or destroy the Established Church, he put it to their consciences if it did not restrain them from interfering with it as an integral portion of the constitution. This country maintained a Protestant monarchy as the best safeguard of its civil liberties; and that was incompatible with perfect equality. What was the equality which the supporters of this motion desired? Would they have Roman Catholic bishops, appointed by a foreign potentate, to take their seats and vote as peers in the House of Lords? He was prepared to yield every civil immunity and right which the Roman Catholics could possibly claim, and was therefore ready to join in removing any grievance of which they could justly complain. On this subject he entered into some details, and read a portion of a speech by Lord Palmerston, at the time of passing Catholic Emancipation, on the profligacy of any union with a "small and compact band" of Catholics in seeking to subvert the Established Church. He concluded with an emphatic declaration of his determination to maintain its integrity.—The debate was then adjourned.

Monday.—The ATTORNEY-GENERAL in answer to several questions respecting the connection of journalists with associations, said that the editors of the Irish Repeal newspapers had been well advised and had exercised a sound discretion in retiring from the Repeal Association; and that gentlemen who were associates of the Anti-Corn Law League would do well to consult their law advisers on the point.—Mr. HINDLEY and Mr. ELPHINSTONE put a question respecting the "League," a paper published by the Anti-Corn Law League, but the ATTORNEY-GENERAL promised to give them advice without a fee in private, should they desire it, but protested against being publicly called on to answer general questions of what was or was not legal.—The adjourned debate on Ireland was begun by Mr. HORSMAN in support of Lord John Russell's motion, followed by Mr. SIDNEY HERBERT and Mr. SMYTHE against it.—Mr. JOHN O'CONNELL said he was one of those who had been termed by Sir J. Graham "convicted conspirators." He intended to devote the short remaining time that might be left to him, not in deprecating the vengeance of the Government, but in promoting to the utmost that cause for which he had the honour of being convicted. The agitation in Ireland was of the most peaceful and constitutional nature; and at the "monster" meetings, which ought rather to be called "sublime," not a single accident had occurred—even unprotected females were secure. Referring to the proceedings of Government in suppressing the Clontarf meeting, he assured the House that the Government proclamation was not posted in the suburbs of Dublin until it was too dark to be read; and the late Rev. Mr. Tyrrell lost his life by his exertions during that night to make the fact known and calm the minds of the people. It had been said that Mr. O'Connell should have gone out to Clontarf, but who could foretel what might have arisen from his presence amongst an excited multitude! It did not become him to say anything about the trials, except to declare that the Attorney-General acknowledged that a fraud in the panel had been committed and he took advantage of it. As to the jury, he avowed his belief that the verdict was given in all the honesty and sincerity of inveterate prejudice and bigotry. But after all, what good could they really expect from these prosecutions? Would the Irish people be the more reconciled to the union when they saw the man who had served them for forty-five years consigned to a dungeon for serving them? The Government proposed to amend the franchise; but would they increase the number of representatives? Ireland was one-third of the empire, and had only a share of one-fifth in the representation. Good might be done if the Government would act with good faith in the matter of education; but in the question of landlord and tenant, they had stirred a most dangerous question, and the commission had excited the wildest alarm; he hoped that the Government would not excite hopes in the minds of wretches in the very depths of despair, which would be doomed to disappointment. Absenteeism was the curse of Ireland—it drained five millions annually from the country. Give to the Irish people the means of employing their own capital, and promoting their industry; it was worth the while of England to try to conciliate Ireland. She was willing to be conciliated; but if Parliament continued their wrongs and insults, [illegible] the consequences.—Colonel VERNER opposed, on their heads be [illegible] and Captain LAYARD supported the motion.—Mr. FERRAND taxed Lord John Russell with the indecorous encouragement which he afforded to members who had received a convicted conspirator on his entrance into that house with cheers. He considered this sanction given by the noble Lord to those who had set the laws at defiance was the last step in Whig degradation.—Sir C. NAPIER was of opinion that the Clontarf meeting should have been suppressed, but that bringing Mr. O'Connell to trial was impolitic and unwise. As to the Repeal of the Union, that was nonsense, and he did not think that even Mr. O'Connell believed in the possibility of it. But he warned the Government of the danger of sending Mr. O'Connell to prison. Ireland might remain passive, but there was a passive resistance which might be carried on, not merely by thousands, but by millions; in a time of war we might be placed in an extremely critical position. Now was the time to do justice to Ireland; and he could not really see any danger to the Protestant Church by giving the Roman Catholic prelates their titles, and making decent provision for the priests. He set the house in laughter by narrating what certain Presbyterian old ladies, relations of his own, thought of the comparative *de*-merits of the Churches of Rome and England; and after some observations on religious tolerance, he warned the Government that the Established Church in Ireland was contrary to human nature and common sense, and would become a Catholic Emancipation question, which would be carried at last, with a "thank-ye-for-nothing." He was once seated on an Irish car, beside a decent young woman, and in conversation she pointed out a man who owned a small garden, and made the striking remark that he had to pay the Protestant clergyman for sending him, as he thought, to perdition, and also his priest to save him from going there. It was hopeless to go on attempting as we had done for three hundred years, to force the Established Church down the throats of the Irish people; and Lord Stanley in reading the Catholic oath and contending that it tied up the hands of the Roman Catholic Members from any effort to get justice for Ireland, had been guilty of a gross insult to their feelings.—Mr. J. O'BRIEN followed in support of the motion; Mr. M. GORE and Mr. M. MILNES against it.—Mr. MACAULAY said it formed a *primâ facie* case for a Committee of Inquiry that a great country with so many natural advantages as Ireland, and with a population amounting to more than a fourth of the whole people of the empire, should at this day be governed not by love but by force. The original source of ill-will was the conquest and tyranny of a race over a race. The Reformation had prevented in Ireland that fusion of races which had taken place in England. Whatever ideas had been associated in the minds of English Liberals with their country's greatness, the ideas of religious and civil liberty, and the names of King William and the Whigs, were associated in the minds of the Irish Catholics with their own degradation and oppression. He traced their sufferings through the period of the penal laws; and coming to the date of the French Revolution, eulogised the policy of Mr. Pitt, who had sought to unite not merely the Crowns, but the hearts and affections of the people. Mr. Pitt had proposed to give franchise to the Irish people, and a high and honourable station to their clergy; and if that great plan had been fulfilled, the Irish Union would at this day be as impregnable as the Union with Scotland. After censuring the Irish Government for not having earlier put forth their proclamation against the meeting at Clontarf, he came to the subject of the prosecutions. To warrant such proceedings it was not enough to have a case which would carry a verdict and a conviction; it was necessary to have a case which would carry a general feeling of the Government's wisdom and moderation. It was said that the people of Ireland were now quiet. Yes, till the sentence, for fear of aggravating it against their leader; but from the time a prison should close upon him the difficulty would begin. Then his name would still remain to stir up discontent; his presence would be wanted to allay it. A Registration Bill was promised; but it must destroy either the last remains of Irish representation, or the last remains of Ministerial consistency. Lord Stanley had contended that the Church must not be touched because the Catholics, before their emancipation, disclaimed all intention of touching the Church, but Lord Stanley himself had abolished slavery, although when the slave trade was first assailed Mr. Wilberforce and all its other opponents used to declare that not slavery but only the slave trade ought to be abrogated. He trusted that Sir R. Peel would take a broader view, would inquire not what had been said 40 years ago about the Church, but whether the Irish Church was now a good or a bad institution, whether or not it accomplished its ends, whether it was in reality the poor man's Church, the means of comfort and of education to the people.—Sir W. FOLLETT (the Solicitor-general, described the motion as a party one and as intended to give encouragement to those who had violated the law in Ireland. That House was not the right place nor this the fitting occasion to arraign the judicial proceedings of a court which had yet to pass judgment on the parties convicted. He would not question Lord John Russell's motives, but a deep responsibility rested on him and those who acted with him. The noble lord had said that the Repeal of the Union was like the question of the repeal of any other Act of Parliament. He controverted that doctrine. There were certain Acts on which the monarchy and the constitution rested—the Act of Settlement by which Her Majesty holds her Crown, and the Acts of Union between Scotland and England and Great Britain and Ireland. The Repeal Association in the pursuit of their object issued cards, declaring that no power could make laws for Ireland but the Crown and the Lords and Commons of Ireland, and they marshalled the people under repeal wardens, gathered them in hundreds of thousands and brought the country into a condition which would not be tolerated in any civilised community. They were told that now they had succeeded in obtaining a conviction their difficulties were only begun—that there was a danger of an outbreak in Ireland. Were they to be compelled to tolerate every culpable act from a fear of the consequences of interference? The Government had proceeded by ordinary process; the indictment was framed on the recognised principles of the common law; the late Government, through Lord Campbell, then Attorney-General, had successfully prosecuted Chartists for conspiracy, on an indictment in almost similar terms; and because one of the parties in the present case, Mr. O'Connell, was a person of eminence—was that a reason why he should be relieved from those penalties to which in England individuals were compelled to submit? It was for the offence of attempting to intimidate the Government and the Legislature, by assembling multitudinous masses of people, that Mr. O'Connell and his associates had been tried and convicted; and if out of a special panel of 716 persons a jury could not be obtained competent to try the case, then trial by jury was impossible in Ireland. The instructions of the Government were expressly that all Repealers, be they Protestant or Catholic, should be struck, but not Roman Catholics as such; and no man capable of judging could say that the jury thus chosen had given a verdict contrary to the evidence. The speeches of the Irish Attorney-General and the Solicitor-General were able, temperate, and free from all attempt to prejudice the case; and therefore Lord John Russell's mischievous declaration that Mr. O'Connell had not had a fair trial was not substantiated. He vindicated the Government generally in its bestowal of patronage and administration of the executive; and repudiated the motion, as couching under it the destruction of the Established Church.—After a few words of explanation from Lord JOHN RUSSELL, the debate was again adjourned.

Tuesday.—Mr. B. COCHRANE presented a petition from the Earl of Dundonald, praying for an extension of his patent for revolving steam-engines for 14 years. The petition was ordered to be printed with the votes.—In reply to Mr. HUME, the CHANCELLOR of the EXCHEQUER stated that the Government were engaged in negotiations for a Post-office treaty with the United States of America.—On the motion of Mr. HUME, the appointment of a select committee to inquire into the nature and extent of smuggling and frauds committed on the revenue was agreed to.—The adjourned debate on Irish affairs was opened by Mr. HAWES, who was followed by the O'CONNOR DON, Mr. E. BULLER, and Mr. GISBORNE, in support of Lord J. RUSSELL's motion; while Lord C. HAMILTON, Sir W. JAMES, Mr. LASCELLES, and Mr. STAFFORD O'BRIEN spoke in favour of Government.—Sir T. WILDE said that when a country with so many natural advantages as Ireland had been so long unhappy, it was but reasonable to inquire into the policy by which she had been governed. All courses had been tried but one—that of good faith and justice. The Union had been a union but in name; it had not given to Ireland that share in her own government which she was entitled to expect. Emancipation, too, had been but nominal. It had been said that a civil war would be preferable to a Repeal of the Union; but how long would the English nation allow such a war to continue? Ireland demands a change in her Church Establishment; your answer is, "The Union forbids it;" and to this she has a right to reply, "Then Repeal that Union." The form of the indictment on the late prosecutions—for meeting to excite dissatisfaction and overawe the Legislature—had long existed; but it had been generally stigmatised in Westminster Hall. The law had been truly stated by the Lord Chief Justice of Ireland—that it was conspiracy to combine, either by lawful means for an unlawful object, or by unlawful means for a lawful object. Which of these offences was that of Mr. O'Connell? By this law, the opponents of the New Poor Law, or the law of slavery, might just as well have been indicted. Undoubtedly the language of Mr. O'Connell had been wholly unjustifiable; but it was untrue that his meetings had been of a nature to overawe the Legislature. It was not Mr. O'Connell who had shaken the people's confidence in the administration of justice in Ireland; the Judge's charge had been deficient in what belonged to the duty of a judge, redundant in what belonged to the business of a counsel. The Government had with extraordinary boldness claimed credit for having been actuated by a merciful feeling towards the traversers in taking a special rather than a common jury. Why, the Government *durst* not take a common jury, because, though their right of challenge to such a jury would have been unlimited, yet it was a right which they would not have ventured upon exercising to any considerable extent, unless where there was some objection which they could openly assign against the individual juror; but the special jury they could strike in secret. Sir T. Wilde then went, with much detail of censure, into the circumstances which occurred in the preparation of the jury-lists. He alleged them to be frauds and he cared not whether the Government were *a party* to those frauds; they took the *benefit* of them. He knew, all Westminster-hall knew, how the English Attorney-General would have behaved in such a case; for in the hands of the English Attorney-General the law and the Government were respected by all. The effect was that 27 Catholics were omitted from the special jury-list, and the Government having got that list almost clear of Catholics resolved to keep it so. The Irish Attorney-General had grossly mistaken his duty. Let it not be said that the Government thought this matter unimportant; they thought the importance of it so great that they were fain to purchase it even at the price of dishonour. Mr. O'Connell's acquittal by a fair jury would have done more good in Ireland than his conviction under circumstances like these. Such a conviction Mr. O'Connell was entitled to treat as illegal, and therefore a nullity. This was said to be a party motion, and in one sense it was so; it was the motion of the party which had always interested itself for Ireland, but it was not a motion intended to shake the official tenure of the Government. He hoped however that this debate would have the effect of drawing from Sir R. Peel an explicit statement of his future Irish policy.—Mr. SHAW gave an explanation of what had happened in the Recorder's office respecting the jury-lists, and positively denied that there was any omission of more than the 24 names which he had accounted for on a preceding night.—Sir T. WILDE made a counter-explanation.—The debate was then adjourned.

Wednesday.—The County Coroners' Bill was read a second time. Some objections were urged to the bill, but it was subsequently admitted that these objections referred to the details, and that the proper time to raise them would be when the bill had got into committee.—On the motion for going into committee on the Horse-racing Penalties Suspension Bill, Mr. BRIGHT, on the part of Mr. Christie, moved that it be an instruction to the committee to extend the provisions of the Bill to all proceedings of common informers under the authority of any penal statute.—The motion was seconded by Mr. CHRISTIE in a speech of considerable length, and was supported by several gentlemen on the Opposition side of the House.—Mr. CRAVEN BERKELEY said he could not concur in the proposed amendment, because its effect would be to suspend the law upon many most important points.—After some further discussion, the gallery was cleared for a division, but none followed, Mr. Bright having agreed to withdraw the proposed instruction.—The House then went into committee, and Lord HOWICK moved an amendment to prevent the bill from extending to future bets, as well as to those over which it was the immediate object of the proposed measure to throw its shield.—Sir J. GRAHAM thought the bill would be very imperfect if it did not extend its protection to future as well as to past bets. Many gentlemen had made bets with the intention of "hedging," and it would be very hard upon them to come forward now and tell them that they should not be allowed to do so.—Lord HOWICK said he would meet that objection by fixing a day, and enacting that the protection of the bill should not extend to any bets made after that day, or the 1st of March next.—Captain ROUS said that many men of small capital who had opened books on the Derby would be utterly ruined if they were precluded from hedging after the first of March next. It was a great pity that honourable gentlemen opposite insisted on meddling with a matter of which they understood nothing. There was no need of interfering with betting at all, and as to talking of the immorality of betting, that was all humbug.—Lord HOWICK insisted upon his amendment, and the gallery was again cleared for a division, but none took place, it having meanwhile been agreed to adopt the principle of the noble Lord's amendment, the 1st of June being the day fixed instead of the 1st of March.—The several clauses of the bill having been agreed to, a discussion arose on the preamble, objection having been made to certain words which appeared to assign ignorance of the law as a pretext for infringing it.—Sir R. PEEL thought it was not expedient to adopt the principle which the words seemed to sanction.—Mr. T. DUNCOMBE opposed their omission; and on a division he was defeated by 81 to 27.—The adjourned debate on Ireland was opened by the Irish ATTORNEY-GENERAL, who began by saying he thought the best thing he could do was to go through all the steps he had taken in the late trials in consecutive order. Within a few days after the informations had been sworn, the streets of Dublin were placarded with bills holding out as a Government spy and a wilful perjurer the principal witness for the Crown, Mr. Hughes, a gentleman to whose honour and integrity Mr. O'Connell himself had borne testimony in the course of the trial. The bill was sent before the Grand Jury on the 2d November; and on the 6th, while it was still before them, an application which might long before have been made to the Commission was made to the Court of Queen's Bench, charging perjury against the principal witness, with a view to prejudice the minds of the Grand Jury. The next application was for copies of the indictment; they asked for eight copies, calculating probably upon delay; but this move had been anticipated, and the eight copies were all ready and were at once handed over. They then required to examine all the copies with the original, hoping to find some variance; but here they were again foiled, by the care with which the copies had been prepared. They next required the names

of the witnesses and the caption as parts of the indictment; but considering these attempts also as made solely for delay, he resisted them, and the Court decided in his favour. Then came a set of nine pleas in abatement, again for delay, on the ground that the witnesses had not been sworn before the Grand Jury. The pleas of abatement were rejected, and the Crown demurrers allowed; and after overcoming every delay which the ingenuity of fifteen counsel could suggest, he succeeded in extorting from the traversers a plea of not guilty. As a public officer, he admitted that his conduct was freely open to question and examination; but he fearlessly challenged any other result than that he had conscientiously fulfilled his duty both to the Crown and the country. Nay, he who was accused of pressing for a conviction had assented to an application for delay, on the allegation of the imperfection of the Jury list for 1843; but if the consent for the Crown had been given to the production of the new Jury list for 1844, before it had, in fact, any legal existence, he felt confident that its production in an incomplete state would have been made a pretext for the postponement of the trials. Sir T. Wilde had affirmed that the English Attorney-General would have consented to the quashing of the Jury panel on the ground of the omissions; and he insinuated that this would have been done from a regard to honour and character. But he threw back the insinuation; Irish law officers were inspired by as nice a sense of honour as English. The Jury list for 1844 was not only a nullity at the time of the application, but its quashing could not have been sanctioned by the Court, for the case of the Queen against O'Connell was not the only one to be tried during the current year. Whig aspirants for office might, in Westminster Hall, whisper to Sir T. Wilde, that the Irish Attorney General had exceeded his duty; but had he attempted to violate the statute, by amending the Jury panel for 1844, or have gone back on that for 1843, and thus have caused the postponement of the trials till January 1845, there was no species of obloquy to which he would not have been subjected. Mr. Justice Perrin, though censuring the negligence in making up the lists, acquitted the legal manager on the part of the Crown of all imputation of participation or fraud. There had certainly been much unnecessary delay and negligence manifested by the clerks of the peace in the making up of the Jury lists—a negligence from which he, as the law officer of the Crown, had suffered as much inconvenience as the traversers; and, therefore, in refusing to assent to the quashing of the Jury panel for 1844, he only did his duty, by preventing, in the existing state of Ireland, the postponement of the trials till 1845. Great complaint was made of the striking off of 11 Roman Catholics from the balloted list of 48. Nine of those were proved indisputably to belong to the Repeal Association. Its books would show their names to those who were anxious to ascertain them; and there was good reason for believing that the 11 were in reality only 10. Sir T. Wilde had said that if the trial had been by common Jury the Attorney-General could not have dared to challenge *ad infinitum*. He was surprised to hear an ex-law officer of the Crown deny its prerogative. He, as Attorney-General, would have dared to challenge every Repealer that presented himself. Mr. Sheil, in a case of trial for murder, had set aside 35 Jurors, 29 of whom were Protestants—to this day he had never heard why these Protestants had been set aside—yet the parties who had done so, said that *he* could not have dared to assert the right of challenge which belonged to the Crown. Mr. Sergeant Murphy had accused him of acting with severity to the traversers, by compelling their constant attendance in Court during the trials. He denied this; he had never acted so ungenerously; with the exception of two days, Mr O'Connell had hardly ever been present 10 minutes at a time; and the only instance in which he had interfered, with the exception of the formality of the first day, was, when they had gone to the Repeal Association in order to make the pending trials the subject of comment. Sir T. Wilde had affirmed that the indictment should have been one for high treason; he was surprised to hear his mitigated form of indictment, reducing high treason to misdemeanour, adduced as an evidence of his having strained the law. But Sir T. Wilde had gone farther: he had laid down that "overawing the Legislature," as in the case of Lord George Gordon, required the actual presence of a mob in Palace-yard, and was not applicable to multitudinous armed meetings at a distance. That might be House of Commons law—it would not do for the Judges. In the form of the indictment, he had followed *verbatim et literatim* the one adopted by Sir T. Wilde himself in the case of Frost, Vincent, and others; and he distinctly denied that the Chief Justice had acted with the partiality attributed to him. Adverting to the challenge which he had sent to Mr. Fitzgibbon he said, "I was misled by a feeling of irritation which ought not to have governed any act of mine, circumstanced as I was. I permitted myself, the court having adjourned for a few minutes, immediately after insulting language had been applied to me, to take a step which I deeply regret. But this I can say, that I am sure there is not a gentleman in this house who would not make allowance for a person acting under the impression that an improper charge had been brought against him. I wish to be understood, when I advert to Mr. Fitzgibbon's name, that I shall not say one syllable to hurt his feelings. He is absent, but I believe if he were present he would admit that language had escaped him inadvertently. Entertaining those views, I shall not say one syllable that can inculpate him. I take the blame upon myself, and can only say further that I considered—I cannot say whether rightly or wrongly—that I had had a gross insult passed upon me. Whatever my character may be—and I think I may appeal to my political opponents—I may at least say that during the whole of my life in Ireland I have kept up a character for personal honour and integrity. Conceiving that an imputation had been thrown out against what I considered to be my personal honour, in a feeling of excitement during the adjournment of the Court for two or three minutes I penned that note. If the Court had never adjourned it would never have happened at all, because it would have all passed off in a few minutes. I wrote the note out of Court; it was suggested that I wrote it in Court, but that was not so; I wrote it in a chamber adjoining the Court, and I thought that the Judge and Jury and all were out of Court: not that that indeed makes much difference, nor do I urge it as an excuse—far from it. I admit I acted with impropriety; but under the circumstances, with a strong feeling that a personal insult had been passed upon me, I do think that gentlemen of generous feeling will be inclined to make some allowance. I shall add nothing more with respect to this, except that I am willing to say, as Mr. Fitzgibbon is absent, that I believe I was mistaken in the construction I put on his language. I only advert to it because if I did not it might be supposed from my silence that I am a person not willing to admit when I am wrong, and I am by no means desirous to be subject to such an imputation." During this explanation the learned gentleman was frequently interrupted by loud cheers from both sides of the House, and he concluded by denying that he had at any time in any speech that he might have spoken said anything which could fairly be construed as offensive to his Roman Catholic fellow-subjects, seeing that up to 1829 he had been a warm friend of Catholic emancipation.—The House then again adjourned.

Thursday.—A petition addressed "To the Representatives in the Commons House of Parliament of the 950,000 British Subjects who at present possess the right of exercising the Elective Franchise," by Mr. S. CRAWFORD, was withdrawn on account of its disrespectful heading.—The motions that stood in the way of the adjourned debate were severally postponed.—To a question put by Sir GEORGE GREY on the occupation of Otaheite, Sir R. PEEL repeated what had been said by the Earl of Aberdeen in the House of Lords, and added, that he had received official despatches from the British authorities in Otaheite, and that he had reason to believe the transaction had taken place without the previous sanction or under the instruction of the French Government.—Mr. MILES brought in a bill to amend the laws relative to master and servants, which was read a first time.—The adjourned debate on the state of Ireland was opened by Mr. MAURICE O'CONNELL, followed by Mr. BELLEW, Mr. HUME, and Mr. C. POWELL, in support of Lord J. Russell's motion; and by Mr. GREGORY, Mr. LIDDELL, Mr. G. A. HAMILTON, and Sir H. DOUGLAS, against it.—Mr. SHEIL then proceeded to address the House in reply to the Irish Attorney-General. He began by explaining the charge made against him of having on the trial of Mr. Pierce struck off 29 Protestants from the jury list, and read his speech made on that occasion as Counsel for the Crown, to show the humanity of his prosecution. He then proceeded to comment on the conduct of the Government. He condemned them for not having summoned Mr. Blake, a Roman Catholic, to the Privy Council, and for having summoned Mr. Shaw, accused them of not having prosecuted the [illegible] authors of the seditious speeches, writings, and poems, as they had been spoken or published, with the intent of waiting until they could accumulate a charge that would crush certain men whose conviction they desired—with having contrived a conspiracy and connived at the inflammatory compositions in the newspapers, for the purpose of urging that conspiracy to a head. He charged Mr. Kemmis with having wilfully neglected to correct the error in Mr. Bond Hughes's sworn information respecting Mr. Barrett, and with having shamefully kept even the fact of the error from the Attorney General. He adverted at great length to all the legal and technical points connected with the trials, the motions for postponement, the challenge of the array and the Jury panel. It was boasted that Government had, on the ground of fairness, preferred a special to a common jury, because on a common jury the Crown would have had an unlimited right to challenge. Remarking on this pretence, Sir T. Wilde had said that the Crown, controlled by public opinion, would not have dared to have challenged without limit, to which the Irish Attorney-General had replied that he would have dared. But a common jury struck under the revision of a sheriff, a man of honour, Mr. Latouche, would have presented Protestants and Catholics indiscriminately, not Repealers—men of substance and respectability, in whom confidence might have been reposed. The Irish Attorney General denied having spoken harshly of his Roman Catholic fellow-subjects, but the reported speech contained the passage in which he declared his belief that Roman Catholics had no regard for the sanctity of an oath. The Catholics of England were neither Repealers nor allies of Daniel O'Connell; but what effect had their proceedings upon them? Even the Earl of Shrewsbury expressed his indignation that the Act of Emancipation was repealed, so far as the jury-box was concerned: Catholics, admitted to the Legislature and the bench, to posts of honour and trust, were denied admission on a jury. Yet Lord Eliot still professed his impartiality: like Mr. Baring's free-trade it was in the "abstract." The Protestant Operative Society of Dublin had addressed Lord de Grey, denouncing in very strong language the mass as idolatrous, and Roman Catholic doctrines as blasphemous—did the Lord Lieutenant resent this insult to his own impartiality, and the feelings of his fellow-subjects? No, he caused an acknowledgment to be returned that the address was "warmly received." It did not become him to speak of the Lord Chief Justice, because he was counsel "on the other side." But Lord Stanley, who had been so indignant with the commentaries on the charge of the Chief Justice, forgot his own motion on Chief Baron Smith. Passing from this, he asked what would be the moral effect of the verdict? Sir J. Graham might yet in his cooler moments repent the phrase "convicted conspirators;" but the speech of Lord Stanley would not add to that moral weight—would be remembered in Ireland, and perhaps in Canada. Ireland was not to be governed by force, but by Protestant charges, juries, and verdicts; but would these not require Protestant bayonets to sustain them? There might be minor matters of detail, but the great question after all was that of the two churches in Ireland—the one without a revenue but with a congregation, the other without a congregation but with a revenue. They were not to touch the Church because, according to Mr. Shaw, it was built on Christian truth. On which bank of the Tweed was Protestant Christian truth to be found? On the one side it was presented in a black surplice and white band; on the other enthroned in an archiepiscopal stall and glowing like that celebrated Babylonian "lady," towards whom under the auspices of Dr. Pusey its affections were beginning to return. At all events their Christian truth had not been very successful in Ireland. *His* religion, indigenous to the Irish mind, had flourished in spite of the blast, and was still rising and spreading; *theirs*, though nursed in a magnificent conservatory, was still a sickly exotic. How had they dealt with the Church in Canada—nay, in England itself? Had they not virtually confessed by their new Factories Bill that the national Church was incapable of undertaking the education of the national mind. Oh, there was no parallel to that Church in Europe!—except in Poland! The Right Hon. member then adverted to the general foreign policy of the Government, using it as a text for warning against leaving Ireland in its present condition. He trusted they would be able to crush all insurrection, for a civil war in Ireland would evoke the wildest and most demoniac passions, which would spare neither age nor sex. He, however, was not without hope that Ireland would at last cease to be the arena of factious contests, and that at length they would offer up their common antipathies to the good genius of their country. What he had witnessed since his return to England, had satisfied him that the great mass of the community in this country were influenced by a friendly feeling towards Ireland. He had heard most admirable sentiments expressed by Hon. Gentlemen connected with Government, both by office and by friendship; and he had also seen evidence that the English nation could, with a generous promptitude, forgive the man who had done wrong, if they thought that he had done wrong, and the moment that they thought oppression had been done him, fly to his succour, and receive him with infinite kindness. That that feeling should be appreciated by his country was his most sincere desire; that it might be the means of producing gradually a national reconciliation—not only uniting the two countries by such a slender ligament as an Act of Parliament could supply—but socially, politically, morally, and indissolubly uniting them, was the prayer of one who was conscious of many faults, but who, whatever might be his faults, never was and never would be reckless of the interests of his country—who was devotedly attached to his beloved country, and who was so far from desiring a dismemberment of the empire, that he now offered up a prayer, as fervent as any that ever passed the lips, or came from the heart of man, that the greatness of that empire might be invulnerable, and that the power and the glory, and, above all, the liberty of England might endure for ever.—On the motion of the ATTORNEY-GENERAL the debate was again adjourned.

Friday.—The second reading of the Newbury and Great Western Railway Bill was postponed for a fortnight to allow the competing line from the South Western Railway to be considered at the same time.—The Poor Law Amendment Bill was read a second time, after an announcement from Sir J. GRAHAM that he intends after Easter to move for a committee to inquire into the operation of the Gilbert Unions.—The order of the day for going into committee of supply was postponed.—The adjourned debate was resumed by Sir FREDERICK POLLOCK, the Attorney-General, who, after expressing the satisfaction with which he had heard the speech of the Irish Attorney-General the other evening, proceeded to thank the House for the manner in which it had approved of his conduct on several trials in which he had been officially concerned. He then detailed the particulars of these trials, particularly those in the Midland Counties and in Wales, and concluded by a consideration of the numerous legal points mooted in the previous discussion.—Mr. O'CONNELL and Sir R. PEEL followed, and at half-past 3 the House divided, negativing the motion by a majority of 101.

CITY.

Money Market, Friday.—Consols closed at 97¼; Red. Three per Cents., 98½ to ⅜; Three-and-Half per Cents., 103⅛; New Three-and-Half per Cents, 102¼; Bank Stock, 195-6; Exchequer Bills, 69*s.* to 71*s.* prem.

Metropolis and its Vicinity.

Central Protection Society.—On Saturday a meeting of tenant-farmers, deputies from the several Agricultural Protection Societies, was held at Freemasons' Tavern, to form a Central Association in London, to be called "The Agricultural Protection Society of Great Britain." The meeting was called at the instance of the Committee of the Essex Society, who had invited the attendance of deputies from the other societies throughout the kingdom, and though limited in strictness to a conference of deputies, the rule as to admission was relaxed in favour of Members of Parliament, and gentlemen interested in agriculture. Mr. Baker of Writtle, chairman of the Essex Society, was called to the chair. There were from two to three hundred persons present, amongst whom were the following:—Viscount Sandon, M.P., General Lygon, M.P., Sir J. T. Tyrrell, Bart., M.P., Mr. Round, M.P., Mr. Q. Dick, M.P., Sir J. Trollope, Bart. M.P., Mr. Fellowes, M.P., Mr. Thornhill, M.P., Sir B. W. Bridges, Bart., Sir J. Chetwode, M.P., Mr. Eaton, M.P., Mr. Plumptre, M.P., Mr. Darby, M.P., Sir C. Burrell, Bart., M.P., Sir G. Chetwynd, Bart., M.P., Sir E. Dering, Bart., M.P., Colonel Rushbrook, M.P., Mr. Lushington, M.P., Mr. Allix, M.P., General Sir J. Watson, K.C.B., Colonel Torrens, &c. A series of resolutions, moved by Mr. Oswald Copland and seconded by Mr. W. F. Hobbs, was then adopted, and it was resolved that a provisional committee be appointed, to wait upon the Duke of Richmond with a copy of the resolutions, and to request his Grace, if he approved of their object, to accept the office of President of the Association. The deputation then proceeded to the residence of the Duke of Richmond in Portland-place, where were assembled the Duke of Buckingham, the Duke of Leeds, Lord Worsley, Lord Beaumont, Mr. Pusey, M.P., Mr. Miles, M.P., Mr. Palmer, M.P., Mr. Cayley, M.P., Mr. Denison, M.P., and several other noblemen and gentlemen connected with agriculture. An animated discussion took place on the part of the landlords and the tenant-farmers, in the course of which the Duke of Richmond, having examined the resolutions agreed to at the meeting of the tenant-farmers, expressed his anxious desire that the tenant-farmers should have a very full representation in the management of the society's affairs. The resolutions were then modified as follows, and unanimously passed:—"1. That a society, called 'The Agricultural Protection Society for the United Kingdom of Great Britain and Ireland,' be now formed, for the purpose of upholding, by constitutional means, protection to British Agriculture. 2. That the object of the society is to maintain protection for British Agriculture not less than that at present existing. 3. That the society shall, through the press, repel the imputations, and point out the inconsistencies, contained in the statements of those who oppose such protection. 4. That party politics shall not enter into the proceedings of this society, and that the society shall on no account interfere in any election for a member to serve in Parliament. 5. That the affairs of this society shall be managed by a president, vice-president, 4 trustees, and a committee of 40 members, whereof 20 shall always be tenant-farmers, and that chairmen and vice-chairmen of provincial societies connected with this society shall be *ex officio* members of the committee, and that the said committee shall have power to add to their number. 6. That the Duke of Richmond be requested to act as President of this society. 7. That the Duke of Buckingham and Chandos be requested to act as Vice-President of this society." The Duke of Richmond having accepted the office of President of the society, and the Duke of Buckingham that of Vice-President, the meeting proceeded to the election of the four trustees and the 40 members to act as a Committee. In the course of the meeting it was announced, that in consequence of some doubts which had existed as to the legality of such a society as that which was in contemplation, the Essex Society had submitted the matter for the opinion of counsel. The case and opinion ran thus:—"An Association has been recently formed in the county of Essex called 'The Essex Agricultural Protection Society,' the constitution and objects of which society will be seen by the printed declaration and rules accompanying this case. It is intended also to form a Central Agricultural Protection Society in London, for the purpose of corresponding with, and directing the operations of, the societies of a similar nature in the different parts of the country. The 'Essex Agricultural Protection Society' will have considerable funds at its disposal, which are intended chiefly to be expended in publications advocating the principles of protection to the interests of British Agriculture. The Committee of the 'Essex Agricultural Protection Society' wish to be advised by counsel for the guidance of the society: 1st. Whether there is anything illegal in thus affiliating the different country or other local societies on the proposed central society? 2d. Whether there is anything illegal in thus forming corresponding societies? 3d. If there is, what course or mode or extent of co-operation would be legal and what illegal?" To this Mr. Platt returned the following opinion:—"The 39th George III. c. 79, which I suppose has raised a doubt as to the legality of the associations in question, has not any application to the subject. The 'Essex Agricultural Protection Society' contemplates a legal object, and seeks to attain it by legal means. Its object is to protect the most important interests in the country, and its means are the concentration of Agricultural intelligence, the diffusion of Agricultural information, and the constitutional appeal to the Legislature by petition in protection of the civil and political interests of the petitioners. I am of opinion that it is the undoubted right of any number of her Majesty's subjects to combine for the purpose of attaining such an object by such means; and if for the purpose of giving vitality and energy to such a combination, they form local and central corresponding societies, such societies are, in my judgment, legal." The following gentlemen were then appointed to act as the provisional committee:—Mr. R. Baker (of Writtle), Essex; Mr. Bloxam, Shropshire; Sir B. M. Brydges, East Kent; Mr. J. Rust, Huntingdon; Mr. T.

Holland, West Surrey; Mr. J. Moseley, East Suffolk; Mr. Rodwell, West Suffolk; Mr. Monk, South Staffordshire: Mr. Allnatt, Berkshire; Mr. Smith, Rutland; Sir G. Chetwynde, Atherstone; Mr. Kirkland, Worcester; Mr. Pinfold, North Buckingham; Mr. J. Brickwell, Buckingham; Mr. E. Lewis, Herts; Mr. Bruck, Gloucester and Cirencester; Mr. Matthews, Vale of Gloucester; Mr. T. Ellman, Sussex; Mr. Weall, East Surrey; Mr. Allix, M.P., Cambridge; Sir J. Trollope, Stamford; Mr. Hudson, West Surrey.

Anti-Corn-law League.—Covent Garden Theatre was crowded to the ceiling on Wednesday night, in consequence of the announcement that Mr. O'Connell would attend. The chair was taken by Mr. George Wilson, and the business of the evening was commenced by a speech from Mr. James Wilson; in the midst of which Mr. O'Connell entered the house. The audience rose in a mass, and cheered for at least ten minutes; after which Mr. O'Connell spoke at great length in favour of a Repeal of the Corn-laws, alluding but very slightly to the late trials. During the progress and at the close of his speech, he was interrupted by vociferous cheering. Mr. George Thompson and Mr. Moore then addressed the meeting on the usual topics.

East India House.—On Wednesday an adjourned Court of the proprietors of India Stock was held for the purpose of considering the papers relative to Scinde. The last Court was adjourned in order to afford time for the printing of the papers laid before Parliament on the first day of the session, for the use of the proprietors. Mr. Cotton now stated that the Court of Directors had no desire to check discussion, but as they had the whole affair under consideration, he would submit to the proprietors the expediency of abstaining at present as a body from expressing an opinion on the subject. The discussion on the resolutions formerly moved was then resumed; and after Mr. Sullivan had replied, the Chairman moved that the Court adjourn. Mr. Sullivan thereupon withdrew his resolutions, and the motion for adjournment was carried.

London Joint-Stock Bank.—A circular has been addressed by the manager of the London Joint-Stock Bank, stating that in consequence of the long-continued depression in the value of money, the directors of that establishment have determined to reduce the interest payable on the monthly minimum balances to their customers to the rate of one per cent. per annum. This reduction to commence on the 1st of March next; and no interest to be allowed on any account, the monthly minimum balance of which on the average of the half-year shall be under 200*l.*

Cleansing the Streets.—The powers of an engine for cleansing the streets, for which a patent has been obtained, were tested on Tuesday in the neighbourhood of Guildhall, in the presence of the Commissioners of Sewers. The engine could scarcely be said to have had a fair trial, for the streets were not sufficiently muddy to show what might be done by it. As far as the experiment went it was satisfactory, and cleared away the dirt and mud with rapidity and certainty. It unites simplicity, strength, continuity of work, and cheapness of construction. An extract from the prospectus, published by the patentee, will explain its properties and its merits:—"The engine is simply and effectively constructed; is enclosed in a case open only at the bottom part of it, to enable the brushes to come in contact with the street or road, so that neither dust nor dirt can escape from it. The mud or dirt is discharged into a receiving truck travelling in front of the engine; the truck when filled is easily detached and drawn away to the laystall or shute; another empty truck is instantly attached to the engine, which proceeds on its work without the delay of taking it from the street with the receiver when it requires to be emptied: thus the engine remains constantly at its work."

The Marquess of Northampton's Soirée.—The President of the Royal Society held his first *conversazione* this season on Saturday, at his mansion in Piccadilly. In consequence of a severe billious attack and slight cold, the Marquess was unable personally to welcome the numerous visitors, as his lordship is still compelled to remain at Castle Ashby. Viscount Alford and Mr. Charles S. Dickens, the son-in-law and brother-in-law of the marquess did the honours of the *soirée*, which was very numerously attended.

Metropolitan Destitution.—Lord Ranelagh and the Earl of Antrim have issued a circular announcing that as the Government, under the provisions of the amended Poor-law bill now before Parliament, intend to provide district asylums in the metropolis for the destitute, and to carry into effect most of the objects for which the union was formed, the committee consider their labours at an end. Subscribers who have paid in the amount of their subscriptions, may receive the same on application. The unclaimed money will go towards paying the expenses the committee have incurred, and the surplus be given to some deserving charity.

Taking the Veil.—The ceremony of taking the veil was performed on Monday at the Roman Catholic Chapel, Bermondsey. The Rev. Dr. Griffiths, Bishop of the London district, officiated, and the chapel was crowded with visitors. The noviciate was Miss Crudden, 23 years of age, who had been in the convent about six months.

Launch of the Janus Steam Frigate.—The launch of this vessel took place on Tuesday week at Chatham Dockyard. Being of a peculiar construction designed by the Earl of Dundonald, who as Lord Cochrane is universally known in the service, curiosity and the fine weather led a great number of persons to the spot to witness the ceremony, which took place in the usual manner. A few particulars respecting this vessel of so novel a design may be thought interesting. The form of body, which nearly resembles that of a wedge towards the extremities, is precisely similar at both ends, and is consequently capable of moving in either direction with equal facility; her capabilities of advancing and retreating in narrow channels for the purpose of offensive warfare are thereby made perfect. She is about 600 tons, her armament will consist of a ten-inch gun at each extremity throwing hollow shot of 86 lbs. weight, and she will also be capable of mounting two 42-pounder guns. The engine by which she is to be propelled is also an invention of Lord Dundonald. It is to be a rotatory engine, which it is said will not occupy more than one-sixth of the space required for the common reciprocating engine. It may be placed so low as to be out of reach of gun-shot, it will have no beams, cranks, side rods, parallel motions, levers, &c., and it may be fixed in less than a quarter of the time now required for fixing marine engines. While its first cost is considerably cheaper it may be more easily kept in repair in the opinion of the projector than the steam machinery now in use on board vessels of war.

St. Stephen's, Walbrook.—On Thursday an adjourned meeting was held in the vestry-room, Roger Cunliffe, Esq. in the chair, for the purpose of further considering Alderman Gibbs's accounts. Messrs. Howett, Rock, and other speakers having expressed themselves much dissatisfied at the conduct of Alderman Gibbs and the manner in which he prepared his accounts, and having stated that the parties selected by him as auditors had not been approved of by the vestry, that three of them were unable to manage their own affairs, and that the name of the fourth had appeared last week in the *Gazette*; resolutions of want of confidence in Alderman Gibbs, and declaratory of the incompetence of the auditors selected by him, were unanimously passed.

Hampton Court.—Her Majesty has graciously granted an apartment in Hampton Court Palace to the Misses Pottinger, sisters of Sir Henry Pottinger, Bart., and also to the orphan family of Sir Lionel and Lady Smith.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Feb. 10.—West Districts, 148; Northern, 216; Central, 214; Eastern, 222; Southern, 276. Total, 1076. Weekly average for the last five years, 946.

Provincial News.

Agricultural Meetings.—The following meetings in favour of protection and for the purpose of adopting measures to resist the progress of the League have taken place since our last report. On Friday at Exeter, Mr. Geo. Turner, of Barton Farm, in the chair, supported by Sir T. D. Acland, Bart., M.P.; L. W. Buck, Esq., M.P.; Sir T. Drake, Bart.; the Rev. Chancellor Martin; Sir J. Kennaway, Bart.; Sir R. W. Newman, Bart.; Sir J. Duckworth, Bart.; A. Stowey, Esq.; Archdeacon Barnes; and about 1000 agriculturists: 300*l.* were subscribed at the meeting.—At Great Marlow on Tuesday, T. R. Barker, Esq., in the chair, supported by Mr. Dupre, M.P., and a great many magistrates and tenant farmers.—On Tuesday at Aylesham, Mr. Warnes in the chair, supported by Sir H. Durrant, Mr. Copeland, and a large body of tenant farmers.—On Wednesday week at Nottingham, Mr. W. H. Barrow in the chair, supported by Col. Rolleston, Mr. Martin, and all the leading agriculturists of the district.—On Tuesday at Durham, Mr. Crofton a tenant-farmer in the chair, supported by the Duke of Cleveland and nearly 1800 landowners and agriculturists. Upwards of 500*l.* was subscribed in the room.—At Leighton Buzzard on Tuesday, Mr. J. Thomas of Lidlington in the chair, supported by a great number of tenant-farmers and landowners of the district.—At Glamorgan on Tuesday, Mr. Watson a farmer in the chair, supported by C. R. M. Talbot, Esq., M.P., R. F. Jenner, Esq., J. B. Pryce, Esq., High Sheriff, Rev. George Traherne, Colonel Entwistle, R. Franklen, Esq., and a large number of tenant-farmers.—At Rugby on Saturday, Lord John Scott in the chair, supported by all the leading members of the Rugby and Dunchurch Association, and by many of the leading agriculturists of Warwickshire.—At Hereford, on Wednesday, Mr. H. Chillingworth in the chair, supported by Earl Somers, Sir J. G. Cotterell, Bart., Sir H. Hoskyns, Bart., K. Hoskins, Esq., M.P., T. B. M. Baskerville, Esq., M.P., J. Bailey, jun., Esq., M.P., J. Barneby, Esq., M.P., and about 200 agriculturists. After the meeting several gentlemen added their names to the subscription list, and upwards of 500*l.* was announced.—At Goole on Wednesday, Mr. Crayke in the chair, supported by a numerous body of agriculturists. Nearly 500*l.* was subscribed before the meeting separated.—In Scotland also several meetings have taken place, the principal of which are the following:—At Edinburgh on Wednesday week, Sir John Hope in the chair, supported by Sir H. Jardine, Sir. H. A. Gibson, Sir C. D. Ferguson, Sir D. Dundas, Mr. John Borthwick, Mr. Callander, Mr. A. Hope, Mr. R. Trotter, &c.—On Thursday week at Linlithgow, J. Dundas, Esq., the Vice-Lieutenant of the county, in the chair, supported by nearly all the landowners and tenant farmers in the neighbourhood.—At Fife on Tuesday, Col. Lindsay of Balcarras in the chair, supported by the Earl of Leven and Melville; Sir R. A. Anstruther, Bart.; O. T. Bruce, Esq., of Falkland; J. W. Melville, Esq., of Mount-Melville; Robert G. Smith, Esq., of Gibliston; John Balfour, Esq. of Balbirnie, and several other agriculturists.—On Friday a meeting of the freeholders of Somersetshire was convened at Bridgewater to oppose the proceedings of the League. The High Sheriff, the Hon. P. Bouverie, presided. Mr. Hancock proposed a resolution in favour of protection, which was seconded by Sir Alexander Hood, Bart. Mr. Beadon proposed a free-trade amendment which was seconded by Mr. Perrot. Sir T. Lethbridge spoke in favour of the original motion, but on a division the amendment was carried by a majority of two-thirds of the meeting. Mr. E. A. Sandford then moved a petition, calling upon Parliament to resist the League, but a counter petition, in favour of free-trade, was proposed and carried. A resolution was also passed, expressing the thanks of the meeting to the Anti-Corn-law League, for their exertions in the cause of free trade.—The Duke of Sutherland has addressed a letter to his agent at Dunrobin on the subject of the Corn-laws. His Grace states, that as some of his friends and tenants are desirous of having a meeting to consider the subject of the Corn-laws, under apprehension of the effects which the present agitation of that subject may have on their agricultural interests, it may be well for him to say shortly what he is disposed to believe right and true in regard to it. "My own feelings," says his Grace, "is in favour of the free current of national industry; of unfettered commerce; of purchase and sale generally; without excepting any trade on which the sustenance of the people depends. I am unwilling to close the best markets for our supplies, and cut off from the people the sources which Providence offers under the varying circumstances of seasons and climates for the produce of commodities necessary for the enjoyment of life. I do not think it is a solid good principle to maintain that a bounty should be given to the grower by a tax on the consumer; and I believe that the protest drawn up by the late Lord Grenville on the subject is substantially sound and just. I also, as I said, think that in conforming to these principles we shall not endanger ourselves; though no doubt in many parts, of England particularly, great improvements will be required, and under any system they should be enforced."—The Duke of Northumberland has also put upon record his opinions on the Corn-laws, in a letter addressed to the committee for forming a Protection Society in Northumberland. His Grace expresses his approbation of such societies, and considers it high time for the agriculturists to bestir themselves in opposition to the League and their "plausible cry of cheap bread." His Grace considers that the manufacturing interests, as a body, are most respectable and intelligent, and have too much good sense to be misled by visionary theories to the destruction of so large a portion of their home market. "Instead," he says, "of a free trade in corn, which must throw vast tracts of land out of tillage, every encouragement should be given to bring uncultivated land into tillage, to make it as productive as possible, to give employment to a much greater number of labourers, and so to prevent the necessity of parochial relief, or of compulsory emigration for our increasing population. I fear that the continued agitation of the League, with the uncertainty of protection to agriculture, has sadly paralysed the improvements of the land by the farmers, and has deprived a great body of the agricultural labourers of a continuous and steady employment."—Lord Western has also again declared his opinions in a letter, giving the sanction of his name and subscription to the Essex Protection Society. His Lordship has caused a letter to be written to the committee, intimating that the deep interest he takes in the welfare of his country impels him, amidst great bodily suffering, to respond to the committee, by expressing his high gratification in having his name added to those of other gentlemen who have joined the society, and that he feels great pleasure in contributing 100 guineas in support of its objects.

Bolton.—On Sunday week the keeper of the menagerie in this town was found dead in the cage of the leopards. His body was dreadfully mangled about the throat, and the scalp was nearly torn off. Being in the habit for a long time of caressing the male, it is thought that he must have gone into the cage with the intention of teaching the animal some tricks, after the fashion of Carter and Van Amburgh, as he had a whip with him and had carefully fastened the door on going in.

Bromley.—It will be in the recollection of our readers, that a few weeks ago an inquest was held at Bromley upon the body of a young woman, named Harriet Monkton, who was found dead in a water-closet adjoining the Church at Bromley, under mysterious circumstances, which induced a general belief that she had come by her death by foul play. When the body was opened, it became evident that the cause of death was prussic acid, and it also appeared that deceased was in an advanced stage of pregnancy. A variety of circumstances transpired which strengthened the impression that deceased did not die by her own hand, but although a minute inquiry took place before the coroner no evidence could be adduced tending in any manner to fix the crime upon any individual, but at the same time the jury felt so strong an impression that there had been foul play, that they declined to return any verdict and at the suggestion of the coroner the inquiry was adjourned. Since that period Inspector Pearce of the detective police has been engaged in pursuing the inquiry, and although the result of his proceedings has not been made public it is understood that it materially strengthens the original suspicion. It is now understood that in the course of a few days there will be a final meeting of the jury, when it is expected that some important particulars tending to throw light upon the affair will be adduced in evidence.

Cheltenham.—The adjourned inquest on the body of the infant sent to the residence of the Rev. Mr. Close, vicar of Cheltenham, was resumed on Saturday. Some additional witnesses were examined, but nothing was elicited tending to implicate any person in the affair. There was no evidence to create even a suspicion as to who the mother of the child may be, and there was nothing to show from what place the body had been sent. Two respectable witnesses stated that Leopold Sach, a converted

Jew, had told them that he was in the kitchen of the vicar's house when the coffin was opened, and that he saw inside the lid a paper on which the words "Behold thy likeness" were written. This however he now denied upon oath; and a servant to the Rev. Mr. Close proved that there was no paper of any kind within the coffin, and that Sach had not been at her master's house on the day on which the hamper arrived there. The jury after a long consultation returned a verdict—"That there was no evidence as to the identity of the deceased, nor as to the cause of death, nor by whom the body was forwarded to Cheltenham."

Folkestone.—A subscription has been commenced in this town for a monument to the memory of the celebrated Dr. Harvey, the discoverer of the circulation of the blood, and several inhabitants have undertaken to collect funds in order to raise this memorial to their illustrious townsman. Dr. Harvey was born in this town, and it is intended to erect the monument on the site of his birthplace.

Gloucester.—The Bishop of Gloucester and Bristol, who has been a large contributor to the establishment of Bishops' College, Bristol, and to numerous churches in the two counties, has addressed a letter to the Secretary of the Ecclesiastical Commissioners, placing in the hands of the Commissioners 2000*l.* towards erecting churches of dimensions proportioned to the population, in poor neighbourhoods of the diocese of Gloucester and Bristol, to which the commissioners shall assign ecclesiastical districts in the course of the present year, the sum to be divided in equal shares among such as they shall judge to require extraordinary aid. In regard to the power of nominating the ministers of the districts, the Bishop leaves the decision to the commissioners; stipulating only that they shall not be placed in private patronage.

Great Ilford.—Our readers are aware that for some months past the parish of Great Ilford, in Essex, has been the scene of considerable excitement, resulting from a controversy which has been going on between the clergy and the parishioners relative to the mode of performing divine service. It appears that the parishioners were successful in obtaining from the clergy a concession to the extent of the abolition of the weekly offertory; but they also demanded that a credence-table, which was erected at the altar, should be removed, and that alterations in the position of the reading-desks should be made, so as to prevent the clergymen, during certain parts of the service, from turning their backs upon the congregation. Resolutions in support of this demand were prepared by the vestry, and forwarded to the Bishop of London, who, after a long correspondence with the churchwardens, declined to authorise the removal of the credence-table, on the ground that it was put up twelve months ago, with the knowledge of the churchwarden, though not with his express permission, and that no objection was made at the time to its introduction. In consequence of this decision a meeting of the vestry took place a few days since, when resolutions were unanimously adopted, requesting and authorising the churchwardens to take every legal step in their power for the removal of the credence-table and for the restoration of the reading-desks to their former position.

Haverfordwest.—On Wednesday week one of the most destructive events ever known in Pembrokeshire took place at Landshipping Colliery, the property of Colonel Owen. While the men and boys, amounting in number to 58, were at work in one of the pits which extends under the river, the water broke in at about half-tide, and so sudden was the rush that 18 only of the number were enabled to make their escape. The remainder were either instantly drowned or crushed beneath the slip. The work of this pit is completely destroyed. No blame appears to be laid to any party, as the persons whose duty it was to survey the work had considered it safe. It had never before been worked at high water, when the pressure must have been much greater than when the above accident took place. Among the numbers who have perished there are several who were fathers with large families dependent on them for support.

Huddersfield.—Mr. Richard Oastler, whose release from the Queen's Prison we recorded last week, made his public entry into the manufacturing districts on Tuesday. Brighouse was the place which had been appointed for the reception of Mr. Oastler by the central committee under whose auspices the fund for his liberation has been raised. An address was there presented to him, in which the committee complimented him on his liberation from prison, and expressed their joy at his re-appearance in the field of his former labours, hoping that he was ready once more to engage in the struggle for the protection of helpless infantile industry. Mr. Oastler had appointed to leave Brighouse for Huddersfield at one o'clock, but long before that hour large masses of the inhabitants of the surrounding country had assembled in front of the Railway Hotel to catch a glimpse of him and escort him on his way; and by the time the procession arrived at Huddersfield the escort amounted to upwards of 10,000 persons. Hustings had been erected in front of the hotel at which the carriage drew up, and he was greeted with renewed bursts of cheering, and another complimentary address was read to him from the Rev. Mr. Howarth, to which Mr. Oastler replied at considerable length. Thanks were then voted to Lord Feversham, Mr. Fielden, M.P., and Mr. Ferrand, for their exertions in effecting his liberation.

Norwich.—The committee appointed to consider the best means of erecting a memorial to the late Earl of Leicester, have selected the design of Mr. Donthorn, of Hanover-street, Hanover-square. There were 76 competitors. The monument chosen is in the form of a fluted column, and as it will be placed at Holkham-hall, on the coast of Norfolk, will serve as a landmark to mariners in all directions. It will be at least 80 feet higher than any surrounding object. On the summit is represented a wheatsheaf, and a novel capital, formed of the heads and fore parts of that peculiar breed of oxen which the earl was known to have much improved, is an open circular work, piercing the masonry from the four sides, probably with a view to place a light in at night. The base is very simple, and rises at once in a perpendicular direction to the height of 4½ feet; thus preventing the necessity of a railing to keep off the deer and oxen, and so that the most wanton person would be unable to injure the sculpture, which consists of three bas reliefs upon tablets 16 feet long and 6½ high (the figures the size of life), and representing sheep-shearing, irrigation, a landlord presenting a lease to his tenants, and the fourth side left open for the inscription. Four massive pedestals abut at right angles, upon which are placed, of the size of Nature, oxen, sheep, a drill, and a plough. The stone has been presented by the Marquess of Hastings from his quarries in Northumberland.

Oxford.—It is stated by the *Oxford Chronicle* that a subscription has been commenced in the University to defray the expenses incurred by the Rev. Mr. Macmullen, in the attempt lately terminated to force Tractarian *theses* on the Regius Professor of Divinity, and that the Rev. Vaughan Thomas, chairman of the committee which conducted the affair with Dr. Hampden in 1836, has headed the subscription with a contribution of 50*l.*

Plumstead.—It is stated by the daily papers that a man called John Bodle, who was found guilty last week, and sentenced to twenty years' transportation, for extorting money from Lord Abingdon's butler, and who about ten years ago was tried at Maidstone for the murder of his grandfather by poison, and acquitted, has confessed since his confinement in Newgate, that he did commit that murder, and that no one but himself was concerned in it.

Portsmouth.—It is announced in naval circles, that Government are resolved to adopt the most active measures to put an end to the traffic in slaves on the African coast, and that the French Government has also determined on the same course. The Penelope, 22, steam-frigate, Captain Jones, and the Prometheus, Lieutenant Pasco, and two or three other steamers are about to be dispatched to the coast of Africa, which they will scour in those latitudes where this traffic is carried on. The smaller steamers will go up the rivers and examine every inlet and creek where it is possible for any slaver to be concealed, and the search along the coast will be so minute that it will be impossible for any vessel to escape the vigilance of the squadron. Three French steamers are being equipped for similar service on the African coast, and there will be a cordial co-operation between the French and English cruisers in every plan resorted to for the effectual suppression of the slave-trade.

Windsor.—A new arrangement, at the suggestion of her Majesty, which will be the means of materially benefiting a great number of the poor of Windsor, has just been carried into effect at the Castle. The whole of the unused cut pieces of bread, collected throughout the various departments of the Castle, daily amounting to a very large quantity, are in future (instead of being wasted by being consigned to the washtub to feed the pigs of those domestics who had the privilege of participating in perquisites of this nature), to be given to the inmates of the several almshouses within the borough, amounting to nearly 30. The distribution, which commenced on Thursday last, will take place on three days in each week, and will considerably add to the comforts of the poor recipients of her Majesty's kindness.—An outrage was committed last week at Datchet, within sight of her Majesty's apartments, on a man named Garnham and two companions, by a mob of between 200 and 300 persons belonging to Windsor and Eton. The complainants were most severely assaulted by the mob, who stripped them of their clothes, and attempted to duck them in the Thames. The outrage and assault originated in the circumstance of Garnham having appeared as a witness against certain beer-shop keepers in the parish of Horton, who were fined in heavy penalties for suffering gambling in their respective houses. On Tuesday last the ringleaders appeared before the Windsor magistrates, and were remanded for three days, to give time for the apprehension of several other rioters.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1195*l.*; Birmingham and Gloucester, 1806*l.*; Eastern Counties, 3124*l.*; Edinburgh and Glasgow, 1748*l.*; Great Western, 11,324*l.*; Grand Junction, 6577*l.*; Glasgow, Paisley, and Ayr, 1151*l.*; Great North of England, 1370*l.*; London and Birmingham, 14,221*l.*; South Western, 4290*l.*; Blackwall, 582*l.*; Greenwich, 661*l.*; Brighton, 2425*l.*; Croydon, 184*l.*; Liverpool and Manchester, 3866*l.*; Manchester, Leeds, and Hull, associated, 5357*l.*; Midland Counties, 2317*l.*; Manchester and Birmingham, 2585*l.*; North Midland, 3928*l.*; Newcastle and Carlisle, 1350*l.*; South-Eastern and Dover, 2252*l.*; Sheffield and Manchester, 477*l.*; York and North Midland, 1490*l.*—The meeting of the Great Western Company took place last week, Mr. C. Russell, M.P., in the chair. The receipts for the last six months of 1843 exceeded those of 1842 by 18,420*l.* The total amount was 337,797*l.* 10*s.* 8*d.*, of which sum 309,445*l.* had been separately earned on the Great Western. The receipts in respect of the Bristol and Exeter as far as Beam-bridge, amounted to 56,543*l.*, and on the line between Swindon and Cirencester, to 11,808*l.* More than the promised reduction had taken effect in the general expenditure, which amounted in 1842 to 110,194*l.*, while in 1843, with a prolongation of nearly nine miles of railway, and an increased trade it was only 103,187*l.*, being a difference of more than 7000*l.* for the half-year. Duty and parochial rates had increased as was predicted under the state of the law, so that more than the saving made by retrenchments had been absorbed. The balance after discharging all interest was 116,820*l.*, from which a dividend of 3 per cent. for the half year, amounting to 102,678*l.*, would be declared, leaving for the present, always the least productive half year, a balance of 14,422*l.* The Oxford Railway will probably be opened early in June, the whole line to Gloucester about the same time, and the Bristol and Exeter line in May. The report having been confirmed, the meeting was made special to authorise the directors to apply to Parliament for powers to authorise the directors to construct a railway from Pangbourne to Newbury, and from Basingstoke to Twyford. A long discussion took place on the advisability of altering the third class carriages, but nothing definitive was settled. In the course of the chairman's address he stated that the subscription towards the erection of a church at Swindon already amounted to 4600*l.* without any assistance from the Church Building Society, and 1380*l.* had been collected towards the school fund. A library for the workmen had been established, and it was in contemplation to inclose a plot of ground in order to afford them the means of amusement by cricket and other manly sports.—The Great North of England Company held their meeting last week and announced a dividend of 1*l.* 12*s.* 6*d.*, the receipts of the half year having increased to 38,272*l.* The improvement of trade appears to have benefited this railway. The balance of profit after allowing for working expenses was 17,365*l.*, which would pay the dividend and leave a surplus of 6494*l.*—The South Western Company held their meeting last week. The report announced that the receipts for the half year had amounted to 179,488*l.*, a sum greater than had been realised during any preceding half year. The surplus of 7230*l.* over the corresponding six months of 1842, and the continuance of a progressive improvement in the traffic since the commencement of the current half year as compared with 1843. were considered by the directors to afford evidence of the stable prospects of the undertaking. The directors expected that the position of Southampton, Gosport, and Portsmouth as passenger and commercial ports must eventually become, in connection with the railway, the great marts of commerce on the southern coast. The total expenditure during the half-year now ended was 76,595*l.* The available balance was 88,562*l.*, out of which the directors recommended a dividend of 35*s.* per share, leaving a balance of 8216*l.* to be carried to the next account. The directors were proceeding with all possible dispatch in procuring power to construct the branch lines to Salisbury and Epsom, the capital for which had been subscribed and the petitions presented to Parliament. The capital for the proposed Newbury line to Basingstoke had been subscribed, and the almost unanimous consent of the landowners secured. The report having been adopted, a lengthy discussion arose with reference to the establishment of steam-boats in connexion with the railway, Mr. Lefevre on behalf of some of the inhabitants of Southampton and Captain Ward, R.N., contending that the company had no right to intermeddle with steam-boat speculations. The chairman and Mr. Locke on the other hand affirming that it was only by such a system of communication with Southampton, the West of England, Havre, and the continent, that the railway interest could be properly maintained. Ultimately it was resolved that the directors be empowered to apply to Parliament for this purpose.—The meeting of the Blackwall Company held last week was one of the most harmonious meetings that has taken place for years in the company. A dividend of 2*s.* 6*d.* per share was declared, and it appears that the introduction of low fares has in a great degree benefited the revenue of the passenger traffic. The extension of the steam-boat connexion with the railway seems still to be regarded by the directors as the source whence improvement may be expected, and hence they persevere in urging upon the shareholders the propriety of raising the guarantee fund to support this branch of their receipts. To carry this motion more generally into effect, a resolution was passed calling upon the shareholders to subscribe, and the feeling of the meeting was in favour of trying the experiment. Favourable mention was made of the application of the atmospheric principle to the working of the trains, and at no distant period it will probably be in use. Should the plan be brought into operation and found to answer the expectations raised, there is every prospect of a material reduction in the present expenditure of the company, which of course must be in favour of increased dividends.—At the Midland Counties meeting, which was held last week, the dividend declared was 2*l.* 4*s.* per share, and the report stated that this line also shows an increase of traffic.

IRELAND.

Dublin.—A rumour has been current in Dublin for some days, that Lord de Grey, who has been lately suffering from an attack of rheumatic gout, intends to resign the Lord Lieutenancy, and visit the Continent for the benefit of his health. The name of his successor has not yet transpired, but Lord Westmoreland is confidently spoken of at Dublin Castle. There have also been rumours that the expediency of abolishing the office of Viceroy has been under the consideration of the Cabinet. Lord Eliot, it is said, is to remain as Chief Secretary, but Mr. Lucas, the Under Secretary, is expected to go out with Lord de Grey, and will, it is said, be succeeded by Mr. Pennefather, the chief clerk in the Secretary's office.—The weekly meeting of the Repeal Association was held on Monday, Mr. Steele in the chair. The resignations of the proprietors of the *Nation*, *Register*, *Pilot*, and *Freeman*, which

were received on the last day of meeting, were now read and accepted. Mr. Smith O'Brien, M.P., said that he had given notice of a motion on the last day of meeting with respect to a petition to Parliament on the subject of the late trials, but before he brought it forward for the adoption of the Association, he would make a few observations. There was one thing which he was happy to be able to congratulate the Repeal Association on, and that was the altered tone of Ministers with respect to Ireland in the debate then going on in the House of Commons. Sir James Graham had not said, as he did last session, that conciliation was at an end; and if new measures were about to be proposed by Ministers, who had the Irish people to thank for these benefits—if benefits they be—but the Repeal Association? He would tell Ministers that the late discussions in the Queen's Bench had made many converts —that nine out of ten of those previously opposed to repeal were beginning to see the errors of their way, and were only afraid of openly avowing their adhesion by the fear of Catholic ascendancy. He was bound to admit that, but he was also bound to state that in his opinion that impression would soon be removed; and when Catholic, Protestant, and Presbyterian joined together, repeal would unquestionably be carried. With regard to the recent debate, he was certainly bound to say that there was in the speech of Lord John Russell many noble and excellent qualities—much to praise and much to find fault with—but his sympathy with their great leader in his present position deserves the gratitude and applause of the Irish people. The opposition members in the House of Commons had certainly acted, in the reception they gave O'Connell, in a most praise-worthy manner—in a manner he would say worthy of O'Connell as well as themselves. The honourable member concluded by reading his proposed petition, setting forth various grounds of complaint in reference to the late trials, and praying for immediate inquiry and redress. Printed copies of that petition would, he said, be sent to all parts of Ireland; and as it was very often alleged that signatures were fictitiously got up, he would suggest that every individual who signed it should write with his name, his occupation, and his place of abode. Let that be sent forward as the monster petition of the Irish people. They had monster meetings, a monster indictment, monster prosecutions, and let them then have a monster petition. He had some hopes that its prayer would be attended to—that the inquiry sought for would be granted; but if it were not, it would afford them an additional reason, if that indeed were necessary, to continue their exertions for a repeal of the legislative union. He concluded by moving that the petition be adopted by the Association which was seconded by Mr. O'Neill Daunt, and passed by acclamation. Mr. Clements the barrister stated that he had been entrusted with a resolution respecting the arbitration courts, unanimously adopted by the committee, and which would he was sure, receive the concurrence of the Association. The existence of these courts was charged in the indictment as an attempt to bring the administration of justice into contempt, and although the people had a perfect right to choose arbitrators to decide their disputes whenever they thought proper to do so, yet the committee thought that the constituted authorities ought to be obeyed, even though they acted under the semblance of the law. The last injunction left by Mr. O'Connell before he left the country was that the arbitration courts should be dissevered from the Association, and to carry out that recommendation he proposed a resolution declaring that the courts had ceased, and that it be left to the Irish people to settle amongst themselves their disputes and differences by arbitrators to be in each case chosen by the parties themselves, without any reference whatsoever to the Repeal Association. Mr. S. O'Brien seconded the motion, which was carried unanimously. The Repeal rent was 562*l.*

Carlow.—Accounts have been received of the commencement of a system of incendiarism in the county of Carlow, similar to that which has so long prevailed in various agricultural districts in England. Threatening letters have also been sent to various persons, calling upon them to give up land at present in their possession; and hayricks have been destroyed on several farms. It is generally supposed that the peasantry have had no concern in these acts of incendiarism.

SCOTLAND.

Edinburgh.—On Monday week a meeting of the contributors to the intended monument to Sir Walter Scott was held, the Lord Provost in the chair, supported by the Marquesses of Breadalbane and Douglas, the Lord Justice General; Lords Mackenzie, Medwyn, and Cockburn; the magistrates of Edinburgh; Sir T. M. Brisbane, Sir T. Dick Lauder, &c. The chairman stated that the object of the meeting was to increase the fund, which had fallen short, chiefly on account of the expense attendant upon a proper preparation of the site, which required to be raised to an elevation with Princes-street. The height of the monument was designed to be 182 feet—the money in hand would only raise it to the summit of the pinnacles of the abutment towers—102 feet: thus leaving 80 feet of the upper part unbuilt, to complete which would require 3,000*l.* in addition to the funds already subscribed. The Marquess of Breadalbane, Professor Wilson, and others, addressed the meeting, and from the enthusiastic spirit which prevailed, there is little doubt of the necessary funds being raised almost immediately. Upwards of 500*l.* was subscribed before the meeting broke up. It is understood that an appeal on this subject will shortly be made to Scotsmen and to all admirers of the genius of Scott in the metropolis, and that Messrs. Coutts and Co. are authorised to receive subscriptions.

Miscellaneous.

Col. Stoddart and Capt. Conolly.—Accounts have been received this week at the Foreign-office from St. Petersburgh, stating that the Russian Envoy at Teheran, in a despatch dated the 15th (27th) of December, had reported to his Government that the information which he had indirectly obtained from the Envoy of the Ameer of Bokhara, who had arrived in Teheran, had only too surely removed all uncertainty as to the tragical end of Captain Conolly and Lieutenant-Colonel Stoddart, for he positively asserted that the first had been executed for having shown on many occasions great partiality for the Khan of Kokan, at that time at war with Bokhara; and the second in consequence of the discovery of a secret correspondence which he kept up with his countrymen at Cabul through the channel of Indian merchants established at Bokhara. The Russian Envoy adds that although the truth of these details can hardly be questioned, an Envoy from the Schah of Persia who is about to proceed to Bokhara on a special mission will be expressly instructed to collect on the spot the most precise information as to the details which accompanied the death of the two English officers. The Russian Envoy further says that the agent from Bokhara, whether from fear or from delicacy, had evaded Lieutenant-Colonel Sheil's attempt to obtain information from him as to a catastrophe which must painfully shock the British representative.—*Times.*

Egyptian Antiquities.—Chevalier Bunsen, the Prussian Minister at this Court, has received letters from Dr. Lepsius, the Director of the Prussian Expedition to Egypt, announcing that he has discovered at Meroe a copy of the celebrated Rosetta-stone in the British Museum. The herioglyphic portion is said to be unusually perfect, and copies of the three inscriptions have been sent to Berlin.

Bituminous Lake.—The *Boston Telegraph* published in Texas, has the following paragraph under this head:—Perhaps few of our citizens are aware that there is a small lake situate within 100 miles of Houston, that is quite similar to the Pitch Lake of Trinidad. This singular lake or pond is situate in Jefferson county, near the pond between Liberty and Beaumont, and about 20 miles from the latter village. The lake is formed of bitumen or asphaltum, and is about a quarter of a mile in circumference. In the winter months its surface is hard and capable of sustaining a person. It is generally covered from November to March with water, which is sour to the taste. Owing to this cause it is called by the people in the vicinity the sour pond or sour lake. In the summer there is a spring near the middle where an oil liquid (probably petroleum) continually boils up from the bottom. This liquid gradually hardens after being exposed to the air, and forms a black pitchy substance similar to that at the sides of the lake. Mr. Butler of Galveston, who has seen the Pitch Lake at Trinidad, examined a piece of the bitumen obtained from this lake, and says it is precisely like the bitumen of Trinidad. This bitumen may at some future day become valuable as a substitute for coal in the formation of gas to light cities. It burns when lighted with a clear bright light but gives out a very pungent odour. The ancients used bitumen as a cement in the construction of walls and buildings. They also used it in many cases as a substitute for tar or pitch. We believe however that little use is now made of it for these purposes, even where it is found most abundantly."

Parliamentary Representation.—A Parliamentary report has been published, giving an analysis of the total number of Members sent to the House of Commons by the several counties, cities, towns, and boroughs in England, Wales, Ireland, and Scotland respectively, according to the late census, 6th June, 1841:—

	Members.	Population.	Total Population.
ENGLAND.			
41 Counties, returning	144	9,115,611	
187 Cities and Boroughs	323	5,879,527

A Case for Annuitants.—The Court of Appeal at Naples has now before it a cause of a most singular nature. Several years ago the Marchioness de Garofolino died, leaving by her will an annuity of 50 florins, to be applied in the maintenance of five favourite cats and the longest liver of them; appointing an old and faithful servant as trustee and guardian of the feline legatees. In the course of nature four of them died, leaving a beautiful Angora, named "Mirouffle," the sole survivor. One day this inheritor of 50 florins a-year disappeared, and soon afterwards the heirs of the deceased Marchioness claimed to have transferred to them the capital from which this splendid income was derived. Compliance with their demand was refused on the ground that they could not produce any proof of the death of the annuitant. They carried their case before the tribunal of Nola, in which place the lost Mirouffle and his trustee lived, but it decided against them, delivering its judgment *seriatim*, that the plaintiffs could not be entitled to the principal or interest until they had given either positive evidence of the demise of the annuitant, or that so many years had elapsed since his birth that, according to the utmost possible longevity of cats, Mirouffle could not be still alive. Not satisfied with this sage and sound decision, the heirs have carried an appeal up to the Supreme Court of Naples.—*Galignani's Messenger.*

Hydropathy in France.—Upon an application being made to the French Government for permission to open an hydropathic establishment in Paris, the Government referred the subject to the French Academy for their opinion. The following are the conclusions to which the Academy arrived after mature consideration—1. That hydropathy is a dangerous therapeutical method, which does not rest on facts; 2, that its theory is chimerical; 3, that it is in disaccordance with our chemical and pathological doctrines; 4, that the Academy cannot in any way approve of it; 5, that the use of cold water has been long in the domains of medicine, and submitted to rules.

Law.

COURT OF CHANCERY.—*Corporation of Gloucester* v. *Wood.*—The Lord Chancellor delivered judgment in this case, which was an appeal from the decision of Vice-Chancellor Wigram. His Lordship said this was a question as to taking money out of Court. He had considered it with some anxiety, on account of the large amount of the sum. It was a suit by pecuniary legatees against the executors of Mr. James Wood, to recover the amount of the legacy given to the Corporation of Gloucester. The sum in question was 250,000*l.* After the suit was instituted a motion was made for payment of the money into Court. The 250,000*l.* was according to the usual course of the Court paid into Court, and it was admitted on all hands that this was a proper order. The cause was heard, and a decree was pronounced in favour of the defendants, and the question was whether under such circumstances the money should be returned in Court pending an appeal to the House of Lords. It had been said that upon the same grounds upon which it was considered proper to be paid into Court it ought to be continued in Court until the final decision of the appeal. His Lordship thought that was not the principle of the Court. After a decree a party in whose favour the decree is given is entitled to take the money out of Court, unless there were some peculiar and special circumstances to lead the Court to depart from that rule. Undoubtedly the danger of the money being lost or misapplied was a consideration, and it had weighed much in his Lordship's mind; but still it must be recollected that the testator in this case, confiding in these executors, had trusted them with a much larger sum of money than what was involved in the present question. There might also be much loss in consequence of retaining the money in Court, in the shape of interest. The question therefore was, what conditions should be imposed? The conditions proposed by the Vice-Chancellor were, that the money should be retained if the plaintiffs wished it, but the defendants ought not on that account to sustain a loss. In judicial decisions the funds must all be considered of the same value. The Vice-Chancellor said, not that the defendants should be indemnified, but that the point should be left open for future consideration. His Lordship would affirm this decision, if the parties would consent to leave the point open for future consideration, in case there should be loss, on whom the loss should fall, and would in that case retain the money in Court.

COURT OF EXCHEQUER.—Sittings in Banco.—*Hart* v. *Windsor.*—The question for the Court was, whether a rule for a new trial should be made absolute or discharged. The action was brought to recover the amount of one quarter's rent for a house and premises in the Wandsworth-road. The defence was, that the house was so infested with bugs as to render it altogether uninhabitable. The case was tried before Mr. Baron Rolfe at the *nisi prius* sittings in the last term, when the Jury returned a verdict in favour of defendant on that plea. In the course of the trial it was proved that the house in question was situated in Spring-gardens, Wandsworth-road, and had been let for the term of three years to defendant at an annual rent of 50*l.* A few days prior to the family entering upon its occupation they discovered that there were bugs in two of the rooms, whereupon they caused such means to be applied as they conceived to be of a nature calculated to get rid of them. In this attempt, however, they were not successful, for on the first night of the family endeavouring to sleep in the house not a single person was able to obtain the slightest rest in consequence of the numberless visitations of these insects. On the following morning it was found that the sheets between which the defendant and his wife had tried to repose presented a mass of "bug carcases and bug's blood." In the course of the succeeding day the "army" increased, and for several days the "force of occupation" had become so alarmingly extensive as to render it a matter of absolute impossibility that human beings could continue to remain in the house. The defendant therefore sent an intimation as to the state of the dwelling. A series of communications ensued between the parties, the landlord offering to endeavour to rid the house of the insects. To this proposition defendant it appeared was willing to accede, provided he was also allowed a quarter's rent to cover the expenses he would necessarily be put to in procuring another residence for his family, whilst the proposed "siege" was being laid and carried on. The landlord however declined to make the required allowance, and upon the quarter having expired the defendant refused to pay the rent in consequence of having been compelled to quit upon the ground that the house was not in a habitable condition. The matter subsequently came before the full court on a motion to set aside that verdict for a new trial, and on the ground that the terms of the contract set out in the lease did not necessarily imply that the house was to be put in a habitable condition by the landlord. There was another ground. The lease set forth that some garden-ground was let to the defendant as well as the house, and the question was raised whether even though there had been an implied contract as to the reasonably habitable condition of the house, the tenant had the power or authority to abandon or give up the possession of both. On behalf of the defendant it was contended principally upon the authority of Smith and Marrable, that the landlord was bound to put his house in a reasonably tenantable and habitable condition. The Court now decided that according to all the old authorities, a landlord was not bound to put his house in such a state of habitable repair as was contemplated in the present case. Their Lordships therefore were of opinion that the rule should be made absolute. It would however be well that in all future leases this condition should be expressed.—Rule for a new trial absolute.

COURT OF COMMON PLEAS.—*Fraser* v. *Bagley.*—This case, which has occupied the Court four days, was brought against Mr. Bagley for crim. con. with plaintiff's wife. Both plaintiff and defendant belong to the legal profession, and had been upon terms of the most intimate friendship. Evidence was adduced to prove the offence against the defendant; but though frequent visits to each other, and of a very familiar kind, were fully substantiated, the testimony altogether failed in the main charge. On the part of the defence, it was established, that the plaintiff seldom dined or slept at home above once or twice a week; that he had spent the fortune he had with his wife in the most extravagant and profligate manner, reducing himself, his wife and children almost to beggary; and that he had been in the habit of abandoning his wife, and leaving her entirely to the care of others. It was also proved that plaintiff had upon several occasions written to defendant, requesting him to call upon Mrs. Fraser to cheer her spirits, she being much depressed in consequence of the course of conduct plaintiff was pursuing. The Lord Chief Justice, in summing up, said that in cases of this kind the law always gave compensation to an injured husband, for the loss of that person who, of all others, should train up his children in the course of religion and virtue. The Jury would, therefore, have to determine in the first place whether the act im-

puted to the defendant had been committed. If they were satisfied it had not, then there was an end of their judicial province, and they need inquire no further; but if on the contrary, the evidence led them to decide in the affirmative, they would have to consider what compensation the plaintiff was entitled to for the injury he had sustained, and in doing so they would look at the nature of his home before the offence was committed—whether it was a happy one, now taken from him by insidious arts, and whether he had been instrumental, by his own conduct, to the loss of that comfort of which he complained, because a man who was a faithful, zealous, affectionate, and kind husband, watching his wife, and showing her all those courtesies and marks of affection which the married state required, was entitled to more damages than he who had been negligent and regardless of the feelings and happiness of his wife. The Jury retired, and after being absent for three minutes, found a verdict for the defendant.

BIRTHS.—On the 1st instant, at Tamerton Folliot, the lady of the Reverend G. F. ARTHUR, of a son—4th inst., the lady of T. HULL, Terrall, Esq., barrister, of a daughter—12th inst., at Belmont, in the county of Chester, the lady of J. H. LEIGH, Esq., of a daughter—16th inst., at 12, Portman-street, Portman-square, the lady of J. DODD, Esq., of a son—17th inst., at Leggatts, the lady of T. KEMBLE, Esq., of a son—17th inst., at Walton, Lady MORDAUNT, of a daughter—18th inst., at Poet's-corner, Westminster, the lady of C. FREERE, Esq., of a son—18th inst., at Pulbro-place, Vauxhall, Mrs. L. DROOSTEN, of a daughter—19th inst., in Great George-street, the Hon. Mrs. J. TALBOT, of a son—19th inst., at 3, Storey's-gate, St. James's-Park, the lady of J. WRIGHT, Esq., M.D., of a daughter.

MARRIED.—On 13th inst., T. PART, Esq., of Bishopgate-house, Wigan, to FANNIE, youngest daughter of T. Woodcock, Esq., of Bankhouse—13th inst., at St. Mary's Church, Scarborough, the Rev. C. TURNER, M.A., second son of the late C. Turner, Esq., of Hanwell-park, in the county of Middlesex, to SOPHIA, only daughter of the late J. Maling, Esq., of Monk Wearmouth, in the county of Durham—15th inst., at Hillingdon, near Uxbridge, J. HUNTER, Esq., of Upper Holloway, second son of W. Hunter, Esq., to MARY ANNE, eldest daughter of the late W. Rider, Esq., of Albion-street, Hyde-park, formerly of Leamington Spa, Warwickshire—15th inst., at Dorking, THOMAS GEORGE, third son of C. Barclay, Esq., of Bury-hill, to EMILY, second daughter of the Rev. J. Joyce, vicar of Dorking—15th inst., at St. James's, Westminster, JOHN, eldest son of F. Farman, Esq., of Old Ford, Middlesex, to MARY ANNE, only daughter of the late John Powell, Esq., of Park-street, Grosvenor-square.

DIED.—At his residence, Bryanston-street, Portman-square, Mr. W. E. PEAL, of the firm of Peal, Brothers, Duke-st., Grosvenor-square—11th inst., at Isleworth, Middlesex, Miss M. DRINKWATER, aged 74—13th inst., HERR ELIZABETH, the relict of the late Edmund Prideaux, Esq., of Hexworthy, in the county of Cornwall—13th inst., at Amsterdam, S. RAPHAEL, Esq., eldest son of R. Raphael, Esq., of the Crescent, American square—14th inst., at Warmington-grange, Gloucestershire, the Hon. Mrs. GIST, only daughter of the late Lord Rossmore, aged 43—15th inst., at Cheltenham, ANN ELIZABETH, relict of the late G. A. Askew, Esq., of Pallinsburn-house, Northumberland, aged 84—16th inst., J. FIELD, Esq., of Chambers Bury, Herts, aged 50—16th inst., at Brentor, Devonshire, Mrs. I. H. HOLWELL, of Devonshire-place, widow of the late Rev. E. O. Holwell, vicar of Plymtree—16th inst., J. WEBSTER, Esq., formerly of Palmall and Brompton-square, and subsequently one of the Superintendents of Factories—16th inst., Mr. H. PURKISS, of Elm-court, Temple, aged 31—16th inst., at Southwick-street, Hyde-park, SUSANNA, eldest daughter of the late Captain H. Leigh, of East place, Lambeth—18th inst., in Craven-street, Strand, ELIZABETH, the wife of C. W. Scorer, Esq., of Hastings—18th inst., at his father's house, in Prospect-place, Wandsworth-road, Mr. E. ROWLANDS, jun., of a rheumatic fever, after an illness of five days, aged 42—19th, at his residence, Peckham-road, Mr. T. COOPER, of Monument-yard—Jan. 3d, Major-Gen. GOODMAN. Beside considerable service in the Peninsula, he was present at Waterloo—30th Dec., at Comfort-hall, Drummondville, Canada, Major-Gen. the Hon. F. G. HERIOT, K.B. and C.B.—Last week, J. HARMAN, Esq., the head of the firm of Harman and Co., of Adam-court, Broad-st., and Governor of the Bank of England in 1816, aged 81—16th inst., at his residence in Manchester-square, EDMOND HENRY, Viscount Glensworth, grandson of the Earl of Limerick, aged 35—9th inst., GERTRUDE ANGELICA MILLS, youngest daughter of John Mills, Esq.

GAZETTE OF THE WEEK.

BANKRUPTS.—RICHARD BECKLEY, late of 33, North Audley-street, but now of 37, Green-street, Hanover-square, grocer—R. L. STURTEVANT, of Church-street, Bethnal Green, soap-manufacturer—W. G. ROWLEY, late of Dover road, Southwark, and late of 6, Felix-terrace, Liverpool road, and now of Deptford, Kent, wine-merchant—ISAAC LUMLEY, of Cornwall-road, Surrey, victualler—THOMAS BRYSON, of 26, Addle-street, city, commission-agent—J. C. PETRIE, of Bedlington, Durham, miller—THOMAS WESTERN, of Brushford, Devonshire, maltster—JOSEPH BLAZEBROOK, of Birmingham, carpenter—R. DAVENPORT, jun., of Birmingham, plumber—R. E. LEE and J. HADDOCK, printers, Craven yard, Drury-lane—J. CONAWAY, cheesemonger, Gray's-Inn-lane—E. ABBATT, baker, Oxford—W. GOLDING, innkeeper, Glemsford, Suffolk—R. PENNY, draper, Cockermouth—W. Jackson, baker, Liverpool—J. HUGHES, painter, Liverpool—J. MALLALIEU, woollen manufacturer, Saddleworth, Yorkshire.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1s. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

BENJAMIN EDGINGTON respectfully informs the Nobility and Gentry, that he has made arrangements for SELLING OFF his extensive Stock of Marquees and Tents, the accumulation of years, at a reduced price. It consists of every variety of size and shape, from the colossal Tent, 300 feet in circumference; the extraordinary Marquee of 700 feet long, to the Garden Tent of 10 feet in diameter. The Public are invited to an inspection at his Manufactory, 2, DUKE STREET, SOUTHWARK. The Marquees and Tents will be found well worthy the attention of all requiring this very ornamental out-door accommodation. The Sale of this Stock will continue till the 25th of March.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

TO AGRICULTURISTS.—IMPORTANT DISCOVERY.

"Quid faciat lætas segetes."—VIRGIL.

THE CORN-PRODUCING LIQUIDS.—"One of the most extraordinary exhibitions in the yard (at the late Agricultural Show, Dundee), was that presented by Mr. JAMES CAMPBELL, of the Dundee public seminaries. It consisted of magnificent plants of Oats and Barley, grown from seed which had undergone a certain chemical preparation, and without the aid of any manure whatever.

"Such a mode of culture is at variance with all practical experience; but Mr. CAMPBELL declares that his prepared seeds, which have produced these strong, healthy plants, were sown by him on land which, to his certain knowledge, had had no manure of any kind for eleven years; and he declared himself quite ready to verify his statement by experiment, and said he was willing, at any time, to impregnate with his chemical preparations the seed which any member of the Society should send to him for that purpose, so as to enable gentlemen to satisfy themselves fully as to the efficacy of this wonderful mode of culture."—*Journal of Agriculture, October*, 1843.

In this discovery is actually realised that boast of science, which some years ago prophetically asserted, that the time would soon come when one might carry in his pocket matter sufficient to manure an acre of land.

After impregnation with these liquids, the seed possesses within itself elements which not only afford additional nourishment to the grain during the progress of germination, but communicate to the expanding vessels of the plant an aptitude to absorb food, both from the soil and the atmosphere.

Of one specimen of Oats exhibited, the average produce of 33 seeds was 1600 grains from each, or a total of 52,800 grains, weighing 48 lbs. per bushel.

The produce of Barley was an average of upwards of 500 grains from each seed sown; and of Wheat sown on 5th July, and taken up on 8th August, to be exhibited, the result was, that while the unprepared seeds gave plants with two, three, and four stems only, the impregnated grain yielded plants with nine, ten, and eleven stems.

The material for these liquids, at the following prices, may be had of the following Agents.

Wheat . . .	material for one gallon . .		2s. 6d.
Barley . . .	do.	do. . .	2 0
Oats and Grasses .	do.	do. . .	1 6
Beans and Peas .	do.	do. . .	2 0
Turnip and Rape-seed	do.	do. . .	2 6

Agents:—Messrs. GEORGE GIBBS & Co., 26, Down-street, Piccadilly, and Mr. EDWARD PURSER, London Manure Company, 40, New Bridge-street, London; JAMES HADEN, Ironmonger, Warminster, Wilts; CROUCH & Co., Newcastle-on-Tyne; P. BRUCE, Hull; JOHN CAMPBELL, 5, Mersey-street, Liverpool; SAMUEL WALDIE, Carlisle; W. W. FYFE, *Agriculturist* Office, Berwick; and F. KARKEEK, Truro.

One-third, or even one-half less grain, is required for seed than is commonly used; and twelve gallons will impregnate eight bushels of grain; for the operation may be repeated in the residual liquid with additional measures of grain, as not more than one-tenth is absorbed in each operation.

Particular printed instructions for using the liquids will accompany invoices. No order under 20 gallons will be supplied.

1, Dudhope street, Dundee.

CUCUMBER and MELON BOXES and LIGHTS.—For Sale, one, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two-light Boxes and Lights complete from 1*l.* 8*s.* Garden Lights made, glazed, and painted, from 1*s.* per foot. Sashes and Frames made, glazed, and hung complete, 1*s.* 8*d.* per foot.—At JAMES WATTS, Sash Manufactory, 8, Claremont-place, Old Kent-road.

*** References given.

A SINGLE BOTTLE OF BETTS'S PATENT BRANDY may now be obtained in a perfectly genuine state. This convenient arrangement for both vendor and purchaser, and their mutual security against deception, is effected by the use of BETTS'S PATENT METALLIC CAPSULE, made of pure and SOLID METAL, (not Tin Foil) which completely encloses the cork and mouth of the bottle, and is embossed with the words "BETTS'S PATENT BRANDY, 7, SMITHFIELD BARS," the *fac-simile* of which is engraved on a label affixed to each bottle.

In the present day it is impossible to produce anything new and useful without exciting the cupidity of imitators. Already attempts are made to mystify the identity of the original and genuine article, by foisting upon the public the contents of bottles having a Tin Foil covering, falsely denominated "a neat metallic capsule." J. T. BETTS & Co. therefore deem it essential to impress upon purchasers the absolute necessity of comparing the embossed Capsules with the Labels, as an infallible mode of detecting fraudulent substitutions.

BETTS'S PATENT BRANDY, thus protected, may be obtained of the undermentioned Wine and Spirit Merchants, at 3*s.* 6*d.* per Bottle, Bottles included; or at 18*s.* per Gallon, as heretofore, at

Bishopsgate Street	W. Stevens, No. 78 and 80.
Bayswater	Charles Simpson, 22, Bayswater Terrace.

MECHI'S UNIQUE PRESENTS.—4, Leadenhall-street.—Superb LADIES' CABINETS and JEWEL CASES, elegant papier maché tables, chess tables, work boxes, card boxes for playing cards, dressing card cases, desks, and dressing cases, pole screens, hand screens, card racks, envelope cases, vases, netting boxes, portfolios, note and cake baskets, superb tea trays, and table inkstands, presenting a tout ensemble of splendour and elegance not to be equalled in London. The papier maché manufactures are superb and various in their design, the prices varying from 50 guineas to a few shillings. A few high-priced elegancies will be sold at cost prices, to clear the stock. Bagatelle tables, backgammon and chess boards, table cutlery, and Sheffield plate, as usual.

PATRONISED AND SANCTIONED BY HER MAJESTY THE QUEEN, H.R.H. PRINCE ALBERT, THE ROYAL FAMILY, AND THE SEVERAL COURTS OF EUROPE.

ROWLAND'S MACASSAR OIL, for the Growth, and for Preserving and Beautifying the human Hair.—Price 3*s.* 6*d.*, 7*s.*, family bottles (equal to four small) 10*s.* 6*d.*, and double that size, 21*s.*

CAUTION.—The words "ROWLAND'S MACASSAR OIL" are engraved on the wrapper of each genuine bottle; and on the back of the wrapper 1500 times, containing 29,028 letters. Without this "None are genuine."

ROWLAND'S KALYDOR,

For Improving and Beautifying the Skin and Complexion.—Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle, duty included.

ROWLAND'S ODONTO,

Or Pearl Dentifrice, renders the Teeth beautifully white and preserves the Gums.—Price 2*s.* 9*d.* per box, duty included.

CAUTION.—Spurious Imitations are frequently offered for sale as the real articles (some under the implied sanction of royalty), the labels and bills of the original articles are copied, and either a fictitious name or the word "genuine" is used in the place of ROWLAND'S: it is therefore imperative on purchasers to see that the word "ROWLAND'S" is on the wrapper. For the protection of the public from fraud and imposition, the Honourable Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp, thus:—"A. ROWLAND and SON, 20, Hatton-Garden," which is affixed to the Kalydor and Odonto. Sold by them, and by Chemists and Perfumers.

*** All others are Spurious imitations.

MILTON'S BEE HIVES, &c.—A sheet of Illustrations, price 1*s.*, of the various Bee Hives, Feeding Machines, and other apparatus connected with the Apiary, being all the Plates of the "Practical Bee Keeper," a new work on Bees, published by J. W. PARKER, West Strand, and may be had of all Booksellers. The sheet of Illustrations will be sent post free on inclosing 1*s.* and a stamp—all letters pre-paid—to J. MILTON, 10, Great Marylebone-street, Wimpole-street.

WANTED.—An active, industrious FARMING BAILIFF who can bring unexceptionable references as to character from his last Situation, and thoroughly understands his business in all its branches. The Farm which he will be required to superintend is about 200 acres, three-fourths of which are Grass Land; therefore he must have a great knowledge of the Rearing, Management, and Selection of Stock, and of the Improvements in the use of Manures. He must be a married man, without incumbrance, and his wife will be required to take the charge of the Dairy and Poultry, to the care of which she must have been previously accustomed. A Scotchman would be preferred.—Direct, post paid, to H. V., Post Office, Hertford.

WANTED.—To Superintend the General Work of an extensive Demesne in the West of England, an unmarried Man, above 30 years of age, of strict moral character, and of active habits. He must thoroughly understand the making of Plantations and the management of every kind of Forest tree, and of Coppice Woods. It is also necessary that he should be well acquainted with Road-making, Fencing, Draining, the making of Levels, and the formation of Embankments. Experience in Landscape Gardening and the Culture of Plants would be an additional recommendation. He would have apartments in the mansion, and board with the principal servants.

Applicants are requested to state, in their own handwriting, their age and qualifications, the Situations they have filled, and the amount of salary they require—forwarded, post paid, to Messrs. BEADEL and FOULKES, Auctioneers and Surveyors, 25, Cateaton-street, London.

WANTED, in a small Family in the Country, a Man as GARDENER and his Wife as Cook and General Servant. The Gardener must be very active, industrious, and well understand his business. His wife must be a good plain Cook, cleanly, and an early riser.—Apply by letter, post paid, to M.B., 38, Charing-cross, London, stating ages, qualifications, &c. Wages, 24*s.* per week, they finding their own board, excepting vegetables. None need apply who cannot have unexceptionable characters.

WANTED, a GARDENER, at Cheshunt, Herts. He must be acquainted with the Management of a Flower-Garden, and with the propagation of Plants, &c., in frames; and must have a good character, and willing to make himself generally useful. single-handed place; 15*s.* a week, and a cottage; no other perquisite.—Direct, post paid, to Spencer's Library, No. 314, High Holborn, to A. Z.

WANTED, 5 miles from London, a healthy, active GARDENER, to take the entire charge of a Gentleman's Flower and Kitchen Garden, with Greenhouse, small Stove, and Conservatory. His character must bear strict investigation. Wages 24*s.* weekly, no extras. Apply, by letter, to H. B., at Messrs. ORGER & MERZON, 174, Fenchurch-street, London.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, where one or more Men are kept.—A single Man, age 35, who perfectly understands his business in all its various branches, has a general knowledge of the propagation and cultivation of plants in general, has no objection to take charge of land, &c., and no objection to go to any part of the Kingdom; can have an unexceptionable character from the gentleman he last lived with.—Direct to W. M., at Mr. PAMPLIN'S Nursery, Hornsey Road, Islington.

TO NOBLEMEN AND GENTLEMEN.

AS GARDENER.—S. SNOW, Gardener to the Earl de Grey, having a single young Man under him, aged 22, who has served him for the last three years and upwards, is desirous to obtain for him a Situation as above, having proved him fully competent to undertake a good Situation.—Direct to S. SNOW, Wrest Park, Silsoe, Beds., where testimonials as to character and abilities will be given. N.B.—The young Man having practised Gardening from his infancy, and lived in several other establishments, will accept of no single-handed Situation.

A GENTLEMAN, having extensive Woods in the North of England, wishes to recommend his FORESTER (a Scotchman, brought up under the late ROBT. MONTEITH, Author of the "Forester's Guide") who has acted for him during the last 12 years, can now devote a considerable portion of the year to such other parties as may be pleased to employ him. He undertakes to manage, value, or report upon, Plantations and Woods in every stage of growth or condition. Terms moderate.—Apply to Mr. HOWLET, 18, Bartlett's-buildings, London.

AS GARDENER.—A Married Man aged 35, without incumbrance, who thoroughly understands his Business, can take charge of Land and Stock if required, can have four years' and a half good character, and be strongly recommended by the gentleman he has just left.—Direct to A.B., at Mrs. Thompson's, Baker, Marlborough-road, Chelsea.

UNRIVALLED NEW DAHLIA.—DANIEL'S "MADELINE."

CHARLES DANIELS begs to inform the trade that he has disposed of what Ground Roots he has to spare of the above splendid Dahlia; therefore, all future orders will be executed with Plants the 1st of May, at 10*s*. 6*d*. each. The usual discount to the trade where six Plants are taken. For description see Advertisement 6th of January.

N.B.—As strict priority will be observed, early Orders are solicited to ensure good strong Plants.—Hessle-road Nursery, Hull, Feb. 27, 1844.

J. D. PARKS, Dartford Nursery, Dartford, Kent, begs leave to announce to the Trade and Public generally, that he has now ready the following Plants:—

LABURNUM INTERMEDIUM, a fine variety from Seed, a luxuriant grower, racemes of flowers very long, flowers thickly set, and of a deeper yellow than the common; selling at 7*s*. Dr. LINDLEY considers it a very desirable variety.

A Seedling Verbena, PARKSIA, which is in the character of Incisa, much improved; selling at 2*s*.

A Pamphlet on THE SPINE, OR DERANGEMENT OF THE BACK, written by J. D. PARKS, who has been afflicted with the same malady, who never walked for three years, very little for six years, now cured, and undertakes the cure of others; can refer persons to a patient now under his care; the Pamphlet, 1*s*., can be had of the Author, or any Bookseller.

Published by BRITTAIN, No. 11, Paternoster-row, London.

All the above can be had of Messrs. HURST and Co., Seedsmen, &c., Leadenhall-street.

N.B.—The Pamphlet can be sent under a 2*d*. stamp.

EUCHARIDIUM GRANDIFLORUM—A SPLENDID NEW HARDY ANNUAL.

WILLIAM MAY begs to offer the above new and beautiful Annual for the first time, seeds of which were kindly presented to him in 1842 by Capt. Widdrington, R.N., who introduced it from the Royal Botanic Garden of St. Petersburg. It is twice the size of E. concinnum, of a brilliant dark rosy red, and very appropriate for masses or beds, blooming most part of the summer, and is decidedly one of the best of annuals in cultivation. May be had in packets, at 2*s*. 6*d*. each, Post-paid.

WILLIAM MAY, Hope Nursery, Leeming-lane, Bedale, Yorkshire.

CROSS-LANES NURSERY, near BEDALE, YORKSHIRE.

W. JACKSON AND Co., in returning their sincere thanks to the Nobility, Gentry, and Public for their liberal patronage, beg to announce that they can still supply the following of first-rate quality, which will be forwarded with the utmost despatch to any part of the kingdom. Delivery at the railway gratis.

100 select showy Herbaceous Plants, in 50 named sorts, for 25*s*.
100 Dwarf Roses, in 50 named sorts, for 20*s*.
100 Do. in 100 named, very fine sorts, for 50*s*.
100 Do. in 100 do., extra fine sorts for 75*s*.
50 Standard Roses, in 50 splendid varieties, including the fine Hybrid Perpetuals, for 80*s*.

A Large Stock of fine transplanted English Oaks of all sizes.

Catalogues may be had on application, inclosing two postage stamps. A remittance or reference from unknown correspondents is respectfully solicited.—Feb. 29, 1844.

NEW AND SUPERB COLLECTION OF SEEDLING FUCHSIAS.

W. J. EPPS begs to announce that his Superb Collection of Seedling Fuchsias are now ready to be forwarded per post, free, packed in tin cases, upon receipt of a post-office order or a reference. For description and price see last week's *Chronicle*.—W. J. E. will not be able to execute any more orders for Espartero, Winserii, and Emperor of China, before the latter end of the month.—Bower Nursery, Maidstone, March 1, 1844.

RANUNCULUSES, ANEMONES, PELARGONIUMS, AURICULAS, CARNATIONS, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by APPOINTMENT FLORIST TO HER MAJESTY, begs to inform the Nobility, Gentry, and Amateurs, that, in consequence of the success he has had in the cultivation of the above flowers at his new Garden, he can offer them at very moderate prices. He would particularly recommend an early application to be made for RANUNCULUSES and ANEMONES, as they should not be planted later than the end of March to ensure a good bloom. His Catalogue of PELARGONIUMS, AURICULAS, and NEW PLANTS, is now ready, and will be forwarded by post on application. The Trade supplied.

WILLIAM MASTERS begs to call the attention of the Nobility, Gentry, &c., to his newly and well assorted COLLECTION OF GARDEN AND FLOWER SEEDS, which being principally grown under his immediate inspection, he can particularly recommend.

100 papers finest Annual Flower Seeds	.	24*s*.	0*d*.
50 do.	do. . . .	12	6
25 do.	do. . . .	6	6

[If the selection is left to W. M.]

Forwarded by Post without additional charge. POTTER'S ARTIFICIAL GUANO and CONCENTRATED LIQUID GUANO.

Exotic Nursery, Canterbury, Feb. 1844.

NEWEST, CHEAPEST, AND VERY BEST FUCHSIAS AND VERBENAS.

FUCHSIAS.—12 fine choice distinct sorts, for . . 7*s*. 6*d*.
" 12 extra very superior, selected from all new kinds sent out last season for the first time, for 15 0

Such as Exoniensis, Enchantress, Ballooniflora, Toddiana, Eppsii, Cormackii, Dennisiana, Prince Albert, Laneii, Frostii, Grenvillii, Fairy Queen (Bell's), Iveryana, Gem (Ivery's), Nobilissima (Smith's), Majestica (Smith's), Defiance (Smith's), Robusta (Smith's), Stanwelliana, Transparens (Youell's), Deansii (Dean's,) Recurva (Dean's), Alice Maude Mary (Bell's), Princess Royal (Bell's), Brockmanii, Prince of Wales (Bell's), Lowryii, &c.

VERBENAS.—12 fine distinct varieties, for . . 3*s*. 6*d*.
" 12 extra and very superior, for . . 6 0

Such as Duke of Cornwall (Knight's), Speciosa (Kyle's), Princess Royal (Youell's), Howardiana (Low's), Prince of Wales (Wood's), Cærulea (Harrison's), Boule-de-Fue (Girling's), Tweediana picta, Minstrel Boy (Girling's), Rosy Queen (Halley's), &c. &c. &c.

Purchasers are requested to send the names of those kinds they already possess; and Mr. MILLER pledges to send them entirely different, and sorts such as will add beauty as well as novelty to their collections. Mr. M. is enabled to do this satisfactorily, having bloomed every new kind sent out last season.—See extensive list in this Paper of Feb. 17, 1844.

100 fine Hybridised Fuchsia Seeds, 7*s*. 6*d*.; fifty, 4*s*.; Geranium Fireball, 5*s*.; Black Nemophylla discoidalis (plants) 1*s*. each.

The above will be sent post free, packed in stout tin cases, so as to warrant their arrival to any part in safety; or may be had in pots, carriage paid to London, and no charge for packing or hamper.

WM. MILLER, Providence Nursery, Ramsgate, Feb. 27, 1844.

DANE CROFT NURSERY, STOWMARKET, SUFFOLK.

SAMUEL GIRLING, ENGLISH AND FOREIGN DAHLIA AGENT, submits the following choice SEEDLING DAHLIAS to his numerous Friends for 1844, plants of which can be had early in May; they are all faithfully described, and early orders are respectfully solicited, as the stock of some of them is very limited. General Catalogues of DAHLIAS, GERANIUMS, PANSIES, FUCHSIAS, and VERBENAS, can shortly be had, on prepaid application.

BEAUTY OF SUFFOLK (BREE's).—Bronzy purple, of superior form and excellent habit; a constant and extra second-rate show-flower; seedling prizes at Ipswich and Stowmarket. Height 4 feet.—Price 7*s*. 6*d*.

BERMONDSEY BEE (PROCTOR's).—A crimson purple, of excellent form and fine general habit, well cupped, stiff petals; when well grown one of the best Self Dahlias in cultivation.—4 ft.—10*s*. 6*d*.

MODEL (BOURN's).—Dark purple, of first-rate form; has taken first prizes at the Metropolitan and other shows, and pronounced a first-class flower. 4 ft.—10*s*. 6*d*.

NONPAREIL (PROCTOR's).—Ruby scarlet, of first-rate form, habit excellent, free bloomer; pronounced by the Horticultural Society of London, and at the Slough exhibition, to be a first-class flower. The stock of this beautiful Dahlia is small, and unless it breaks well will be held in another year. No allowance on this variety unless six plants are ordered. Glenny's opinion of this Dahlia is, that well-grown it will be a trimmer. 4 ft.—10*s*. 6*d*.

ORANGE PERFECTION (BOURN's).—Of good form and habit, an extra second-rate show-flower, rather low in the centre, but sometimes well up, when it will beat all the orange class. 4 to 5 ft.—7*s*. 6*d*.

RED ROVER (GIRLING's).—Of good general properties and extra fine habit; colour fine red, and useful for showing. 4 to 5 ft.—7*s*. 6*d*.

TALMA (GIRLING's).—Purplish rose, of superior form and habit, little short of first-rate; rising centre and very constant, 4 ft.—7*s*. 6*d*.

SIR JOHN STEWART RICHARDSON (Union, in which S. G. has a share), which is one of the most popular Dahlias of the season. No allowance on this variety unless 12 plants are ordered. 4 ft.—10*s*. 6*d*.

FANCY DAHLIAS.

CORNELIA (GIRLING's).—Purple, tipped with white; of good habit and very distinct. 4 ft.—5*s*.

GARLAND (GIRLING's).—With three colours—cream, sulphur, and brown tip; of good form and habit. 5 ft.—5*s*.

MADAME MIELLEZ (GIRLING's).—Rose-lilac, tipped or striped with white; a distinct variety, of good habit. 3 to 4 ft.—5*s*.

MADAME DE BERGHE (GIRLING's).—White edged with pink; a distinct and beautiful variety. 3 ft.—5*s*.

MADAME CHAUVIERE (GIRLING's).—Light crimson tipped with pure white; very constant, good shape, and one of the finest border Dahlias in cultivation. 4 ft.—5*s*.

VILLAGE MAID (GIRLING's).—Colours white and purple, distinctly and beautifully tipped; good habit, and superior border variety. 3 to 4 ft.—5*s*.—Stowmarket, Feb. 29, 1844.

GAINES'S NEW AND FIRST-RATE PELARGONIUMS now ready for delivery, in strong, healthy Plants. The following are a few selected:—Gaines's Elegans nova, King of Beauties, Ackbar, Lady Prudhoe, Saxon King, Excelsa, Beauty Supreme, Mogul, Edith, Countess of Zetland, Cotherstone, Egbert. A list of Pelargoniums, Pansies, Calceolarias, Fuchsias, Verbenas, Auriculas, Cinerarias, Chrysanthemums, Dahlias, &c., which contains many new Seedlings of first-rate qualities; plants in May, 10*s*. 6*d*.; also a few roots of his Seedling Dahlias PRINCESS ALICE and TWICKENHAM RIVAL are still to be disposed of at the Nursery, Surrey-lane, Battersea.

JOHN MILLER, surviving Partner of the late firm of SWEETS and MILLER, Nursery and Seedsmen, Bristol, begs respectfully to inform Nurserymen, the Trade, and his Friends in general, that he has commenced business as Auctioneer and Valuer of Horticultural and Agricultural Stock, &c., hoping by strict attention to the interests of his employers, to merit their support. Letters addressed to JOHN MILLER, Portland House, Kingsdown, Bristol, will meet with immediate attention.—Bristol, February 29, 1844.

WILLIAM MASTERS begs most respectfully to inform the Nobility and Gentry of the United Kingdom that he unites the Professions of LANDSCAPE-GARDENER and NURSERYMAN, and this enables him to offer an extensive Collection of Coniferous Plants, as well as of the Hardy Ornamental Trees and Shrubs cultivated in Britain, at very moderate prices.

W. M. also possesses a numerous Assortment of Hothouse and Greenhouse Plants, many of the rarer species of Orchidaceæ, several new hybrid Crosses, Rhododendrons, Azaleas indica, Camellias, Succulents, Pelargoniums, &c. &c.—Exotic Nursery, Canterbury, Feb. 1844

SLOUGH NURSERY, NEAR WINDSOR,
CHOICE SELECTION OF NEW DAHLIAS, 1844.

THOMAS BROWN directs attention to his beautiful SEEDLINGS, particularly that unrivalled light flower, "LADY ST. MAUR," the superiority of which over every other of its class is too well known to need further comment. Strong and healthy plants will be ready for delivery early in May.

AURANTIA (Spary's)—Orange buff; fine form and petal. A very desirable show flower; obtained numerous prizes; 3 ft.	10*s*	6*d*
ALEXANDER (Brown's)—Maroon and crimson mottled; full and constant, centre well up, and a very useful show flower; 5 ft.	7	6
DELIGHT (Brown's)—Cream, veined and tipped with purple; petal of fine substance and high centre; very distinct to any in cultivation; 4 ft.	7	6
DESIRABLE (Brown's)—Shaded buff, quite new in colour; a good show flower; 5 ft.	7	6
LADY ST. MAUR (Brown's)—White, delicately tipped with violet purple; very deep and full, high centre, forming a beautiful outline; the petals are round, and smooth at the edge; habit of Perpetual Grand: it is decidedly the finest light flower ever offered. It attracted great admiration at Windsor, and was universally acknowledged to be the finest flower in the Exhibition; 4 to 5 ft.	10	6
NUTWITH (Brown's)—Bright crimson; a fine open-cupped petal, and a good show flower; 4 ft.	7	6
RAPHAEL (Brown's)—Dark maroon, beautifully shaded with light crimson; superior petal, of excellent form: a very novel and striking variety, and will be an acquisition to any stand; 4 ft.	10	6
REMBRANDT (Brown's)—Dark purple, very round and double, rising well in the centre, and a constant show flower. It was very successfully exhibited; 3 to 4 ft. .	10	6
EMMA NORE (Dowding's)—Blush white, good general form and centre: a good useful show flower; 4 ft. .	10	6
ESSEX BRIDE (Turville's)—Delicate peach lilac, of excellent petal and form; 5 ft. . . . (*no discount*)	10	6
LADY ANTRODUS (Spary's)—White and lilac, mottled; good form, constant, and very useful show flower; 3 ft.	10	6
NONPAREIL (Proctor's)—Ruby scarlet, of first-rate properties; extra show flower; 4 ft. . (*no discount*)	10	6
STANDARD OF PERFECTION (Keynes')—Crimson; of very superior form; 4 ft. . . . . (*no discount*)	10	6
SIR J. STEWART RICHARDSON (Union)—Brown ruby, great depth, and excellent show flower; 4 ft. (*no discount*)	10	6

T. B. has also Selections of fine Carnations, Picotees, and all other Florists' Flowers; Plants, Fruit-trees, Shrubs, and general Nursery Stock.

A general Catalogue of Dahlias, with a List of Superb New Pansies, to be had on application.

TO THE NOBILITY, GENTRY, CLERGY, AMATEURS, AND OTHERS.

THE SUBSCRIBER begs to state that he is prepared to supply the undermentioned, viz.:—

CINERARIA, "The Queen of May,"—a beautiful sky-blue, of shrubby compact growth, quite new colour, of fine form and large size, at 5*s*. each.

CINERARIAS—12 of the most distinct and approved varieties for 20*s*.

FUCHSIAS—25 distinct fine sorts, including his own seedlings, for 20*s*.

CALCEOLARIAS—20 distinct and good sorts, of all shades of colour, for 30*s*.

HOLLYHOCKS—fine strong one-year-old plants from his best selected seed, 20*s*. per 100.

HERBACEOUS PLANTS of the most showy varieties, correctly named, 100 sorts for 42*s*.

HARDY, FLOWERING, and EVERGREEN SHRUBS, in 50 sorts, two plants of each, correctly named according to Loudon's "Arboretum Britannicum," at 42*s*. per 100, including package.

He will also have to offer in April a new Collection of beautiful Calceolarias, not yet sent out, a Descriptive Catalogue of which is in preparation, and will be forwarded to applicants. These are from his own celebrated Stock, and of the same breed as his Cal. "Lady Constable," so much in repute.

Seeds in packets of Hollyhock, Pansy, Picotee, Calceolaria, and Hybrid Fuchsia, at 2*s*. 6*d*. and 5*s*. each.

TO THE TRADE, MARKET-GARDENERS, AND OTHERS, he begs to state that he has yet to offer a few thousands of GOOSEBERRIES, and the large RED ANTWERP RASPBERRIES.—The Gooseberries are comprised in upwards of 100 of the most generally useful kinds in cultivation, and the Red Antwerp Raspberry is decidedly the best sort grown, for produce, size, and quality; both of which he will offer on very moderate terms, in quantity. The plants are young, clean, strong, and healthy, two and three years old.—Also MAY's new large late red "Victoria Currant," a dish of which was sent to and exhibited in 1842 at the Horticultural Society in Regent-street, London, some of the bunches of which measured 6 inches in length, and individual berries 1½ inch in circumference—15*s*. per doz. New Black Bang-up Currants, 6*s*. per doz. The usual allowance to the Trade on the Currants.

Woollen Net for protecting Fruit-trees from frost, of the best material, at 9*d*. per yd.

Stove and Greenhouse Plants and Florists' Flowers of every description. Forest and Fruit Trees, Garden and Flower Seeds, of all the approved sorts. WILLIAM MAY.

Hope Nursery, Leeming-lane, near Bedale, Yorkshire.

All the common varieties of Flower-seeds not named in the above List may be had in 3d. and 4d. packets. A general Catalogue will be sent with every order, in which each variety will be found described, whether hardy, half-hardy, or tender Annuals, or Perennials.

Fine Giant Asparagus, 3s per 100.

A choice selection of Pot-roots of all the best varieties of Dahlias in cultivation, from 1s. to 2s. 6d. each.

Splendid Mixed Ranunculus, 5s. to 8s. per 100.

Myatt's Victoria Rhubarbs (true from the raiser), 1s. 3d. each.

Carnations and Picotees, all the most beautiful varieties, 1s. 6d. to 2s. 6d. per pair.

Yellow Picotees, 3s. per pair.

A superior collection of Pansies, comprising all the new and approved varieties, of which priced Catalogues may be had on application.

A constant supply of all the choicest kinds of Phlox, Pentstemons, Œnotheras, Delphiniums, and other favourite Herbaceous Plants will be kept during March and April.

Orders taken for Miller's splendid New Verbenas and Fuchsias, Plates of which may be seen in "Paxton's Magazine" for February and March, or at No. 6, Leadenhall street.

Metallic Wire and Labels, Garden Tools, Knives, &c. &c.

Agents for the sale of Humphrey's Compound.

Wholesale and Retail Seed Establishment, 6, Leadenhall-street;—Warehouse, 19, Vine street, Minories.

SEED-TRADE—NO MONOPOLY.

J. G. WAITE, 1 and 4, Eyre-street-hill, Hatton-Garden, London, most respectfully begs to acknowledge the handsome support he has received from all parts of the country since his Advertisement in the *Chronicle* of last Saturday, and assures all those who may favour him with Orders that he will continue to pursue the system he has adopted in supplying Genuine Articles at the smallest remunerating profits, without heeding the opposition of Monopolists, or the clamour of parties interested in keeping up high prices.

J. G. W. refers his Lancashire friends to his CATALOGUE of SEEDS, advertised in the *Preston Guardian* of this day.—March 2nd, 1844.

PASTURE AND LAWN GRASSES of the Finest Quality, selected for every description of soil, consisting of Poas, Fescues, Gold Grass, Meadow Foxtail, &c., with a moderate supply of Clover, will enable Noblemen and Gentlemen to lay down upon very reasonable terms. **Particulars of quantities suitable to various soils to be had, with an estimate of the cost per acre, by application to WARNER and WARNER, Seed-merchants, 28, Cornhill, London. Genuine Italian Rye-Grass, Mangold Wurtzel, and superior selected Turnip-Seeds.**

PERENNIAL GRASS SEEDS.

SUTTON AND SONS, having for many years paid particular attention to the collecting of NATURAL GRASSES, and having been employed by most of the Nobility and Gentry of Berkshire, Hampshire, and Oxfordshire, to mix Seeds in proper sorts and proportions to suit the soils on their Estates, both for laying down new Pastures and improving old ones, have great confidence in soliciting orders from the readers of the *Gardeners' Chronicle*, in the more northern parts of the kingdom.

SUTTON and SONS have just published a Descriptive Table of Grasses, with some information which they consider would be acceptable to their Agricultural friends, and which may be had gratis.—The cost of the Seeds is very moderate, as will be seen by a reference to the Table above referred to.

Agents for Potter's Guano.

Reading Seed Warehouse, 7 and 8, Market pl., Reading, Berks.

FLOWER-SEEDS.—The most Showy & Hardy known in a Collection of 50 Sorts, with Instructions		£0 12	6
Ditto in 30 ditto		0 7	6
Ditto in 20 ditto		0 5	0
The most Choice Sorts of Tender and Hardy Annuals, including most Superb German Asters, Stocks, Zinnias, Hollyhocks, Nemophylla discoidalis, Viscaria oculata, &c. &c. &c., in 50 Sorts		1 1	0
Ditto equally choice in 30 Sorts		0 12	6

Messrs. SUTTON and SONS growing almost every kind of Flower-Seed worthy of recommendation, are enabled to supply their customers with such New Seeds as will not cause the disappointment so often experienced in attempting to produce a constant supply of bloom in the Flower Borders.

N.B. Parcels delivered free to London or sent free by Post.

Agents for Potter's Guano & Whitney's transparent Composition.

Reading Seed Warehouse, 7 and 8, Market-pl., Reading, Berks.

SEEDS.—Belgium Large White Carrot, 1s. per lb.; Mangold Wurtzel, Long Red, Orange Globe, and Red Globe, 1s. per lb. each; Le Couteur's Belle Vue Talavera Wheat, 11s. per bushel; Kintbury Skinless Barley, 8s. 6d. per bushel; Meadow and Pasture Grass Seeds in Mixtures, suited to soils, &c., at 32s. per acre; Mixed Sorts for improving old Grass Land, 1s. 3d. per lb.; Fine Sorts for forming Lawns, &c., 1s. 4d. per lb. Price Catalogues of Turnips and other Seeds are ready. Kitchen Garden and Flower Seeds.—GEORGE GIBBS AND CO., Seedsmen, &c. to the Agri. Soc., 26, Down-street, Piccadilly.

SHILLING'S EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the above PEA, the Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they, with confidence, recommend to the Public generally, being quite as early, and nearly double the size of any other Pea in cultivation. Quite hardy, will stand the winter well, and a good bearer; the pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 3s. per quart; 10s. per gallon; 17s. 6d. per peck; 30s. per half-bushel; 2l. 10s. per bushel. Agents:—Messrs. FIELD and CHILD, 119, Lower Thames-street, London; Messrs. W. and J. NOBLE, 152, Fleet-street; Mr. KERNAN, 4, Great Russell-street, Covent Garden; Messrs. HURST and M'MULLEN, 61, Leadenhall-street; Messrs. GRAY, ADAMS, and HOGG, Kensington; Mr. T. D. WATKINSON, Market-place, Manchester.—Northwarnborough Nursery, near Odiham, Hants.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3s. 6d. each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

A CATALOGUE OF CHOICE DAHLIAS, sold by W. R. WHALE, FLORIST, &c. &c., Elcot, near Hungerford, Berks.

Whale's Preceptor, a seedling of 1842; bright crimson scarlet; good substance and outline; beautifully cupped petals; splendid show flower; fine habit; height, 4 ft.	10s. 6d.
Second—Crimson Perfection, of great substance, being 20 petals deep; high rising centre; fit for a back row flower in any stand; good habit; height, 4 ft.	10 6
Third—Mary; white ground, margined with rose-pink; a fancy border variety; constant and abundant bloomer; height, 3 ft.	5 0
Spary's Lady Antrobus; white ground, margined with scarlet lake; beautifully cupped petals; good substance and outline; took numerous prizes; decidedly the best light show flower of the season; height, 3 ft.	10 6
Second—Aurantia, on an orange-buff; decidedly the best flower of its class; took several prizes; height, 4 ft.	10 6
Madeline (Daniel's); a beautiful lilac; good substance; fit for a back row flower constant; height, 4 ft.	10 6
Prince of Waterloo (Drummond's); a shaded red; beautifully cupped petals; fine centre; took the first prize at Chippenham; placed before Keyne's Standard of Perfection, Lady Antrobus, and Brown's Lady St. Maur; first prize at Bath, &c.; height, 4 ft.	10 6
Sir H. Pottinger (Drummond's); dark plum colour; cupped petals; good centre; a most desirable show flower; height, 4 ft.	10 6
Sir J. S. Richardson, Union; one of the best flowers of the season; height, 4 ft.	10 6
An improvement on the Duchess of Richmond.	
Opher Yellow (Edwards's); fine show flower; height, 4 ft.	10 6
Bermondsey Bee (Proctor's); crimson-purple; fine show flower	10 6
Nonpareil (Proctor's); ruby-scarlet; first-rate	10 6
Talmer (Girling's); purplish rose; good show flower	7 6
Royal Sovereign (Stanford's); bright-yellow. This flower is little known, and scarce; was shown in Hampshire, Sussex, &c., last season in grand style; height, 4 ft.	5 0
Park Mount Rival; a superb yellow	10 6
Vanquisher (Wood's); shaded maroon; first-rate	10 6
Lady Stanford (Groves's); yellow; fine	7 6
Cheltenham Queen (Hodge's); white; first-rate	7 6

The following Varieties, at 30s. per Dozen.

Antagonist (Bragg's), white
Ashmodeus (Davis's), dark
Beauty of Sussex (Mitchell's), edged
Blanche Shelly (Mitchell's), edg.
Blue Bonnet, brown, self
Colonel Baker (Dodd's), self
Confidine (Cook's), orange
Cornett (Thomson's), dark, self
Dreadnaught, self
Essex Triumph, dark, self
Favourite (Dodd's), light-edged purple
Hero of Stonehenge (Whale's), dark-mulberry
King of the West (Walters's), dark, self
Miranda (Brown's), white-mottled purple
Mrs. J. Richardson (Edwards's), white and purple
Mogul Atwell, self
Paul Pry (Brown's), rose
Perpetual Grand (Brown's), red
Purple Perfection (Mitchell's)
Swindon Rival (Compton's), mottled-rose
Sir R. Sale, self
Sultana (Appleby's), shaded purple
Vivid (Thomson's), scarlet
Virgil, dark, self
Perfection (Keynes's), purple
Venus (Gains's)
Venus (Atwell's), white
Suffolk Hero, dark, fine
King of Lilacs (Girling's)
Claude Laurain (Harrison's)
Lady of the Manor (Atwell's), light-edged purple
Lady of the Lake (Gains's)
Sir R. Chester (Stein's), dark, self
Lirchiel, scarlet, large flower
Lady Sale (Edwards's), red
Victory of Sussex (Stanford's), dark, fine
Novelty (Whale's), shaded red
Queen of Trumps (Brown's), &c.

The following Good Old Varieties, at 12s. per Dozen.

Admiral Stopford
Andrew Hofer
Admirable
President of the West (Whale's)
Phenomenon, ditto
Attila, ditto
Beauty of the Plain (Spary's)
Mrs. Shelly
Lady Cooper
Maria (Wheeler's)
Competitor (Hodges')
Grand Baudine (Low's)
Conservative, ditto
Bedford Surprise
Lady Murray
Euclid (Ward's)
Eclipse, W.
Eclipse, C.
Tournament, C.
Indispensable, G.
Burnham Hero
Bridesmaid
Maid of Bath
Candidate (Silverlock's)
Duchess Richmond
Lady Harland
Marquis Lansdowne
Metella (Brown's)
Marchioness Exeter
Prince of Wales, D.
Prince of Wales, G.
Pickwick
Princess Royal, H.
Queen, W.
Rival Sussex
Rouge-et-Noir
Sir F. Johnstone
Springfield Rival
Twyford Perfection
Prince Albert, A.
Defiance (Cox's)
Rose Unique (Ansell's), &c. &c. &c.

Robespierre, dark plum-colour, 2s. 6d.

A Good Assortment of Fancy Varieties, at 12s. per Dozen.

Oakley's Surprise, Nihile, &c. &c. &c.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 139, Fleet-street. A Prospectus may be had detailing the prices, &c.

THE KENSINGTON NURSERIES.

THE LEASE of one of these Nurseries expires shortly, and the Ground being required for Building purposes, Messrs. PROTHEROE AND MORRIS are instructed to offer to public competition the invaluable Stock on the smallest of these Nurseries, in the occupation of Messrs. FORREST and Co., and the Stock being far superior to any within a considerable distance, will afford Gentlemen, Noblemen, and others engaged in planting, a fine opportunity to supply themselves, not likely soon to recur. The sale is on the 4th March and following days, and includes ornamental Trees and Shrubs of every description, variegated and Green Hollies, Evergreen Oaks, and Cork Trees, large Fan and other Yews, twice transplanted Common and Portugal Laurels, Arbutus alaternus, Hemlock, Spruce, &c. May be viewed prior to sale. Catalogues 1s. each, returnable to purchasers, may be had on the premises, of the principal Seedsmen, and of the Auctioneers.—American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to public competition at the Auction Mart, Bartholomew-lane, on Thursday, March 14, 1844, and the following day, at 12 o'clock, about ONE THOUSAND STANDARD ROSES in fine condition, consisting of Bourbons, Hybrids, Perpetuals, Noisettes, &c. Also, a fine assortment of Dahlias in dry roots. May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

JOHNSON'S GARDENERS' ALMANACK is THE SEVENTH EDITION of just published by the STATIONERS' COMPANY, Price 1s.

WARNER & WARNER, Seedsmen, 28, Cornhill, London, beg to refer their Friends to their new and choice List of Vegetable and Flower Seeds in Harrison's Floricultural Cabinet for this month; and also to inform them a List of the newest and most approved seeds will appear in the *Chronicle* of the 9th March.

N.B.—Catalogues may be had on application.—Agents for POTTER'S LIQUID GUANO, in Quart Bottles, at 1s. 9d. each, with printed Directions.

The Gardeners' Chronicle.

SATURDAY, MARCH 2, 1844.

MEETINGS FOR THE FOLLOWING WEEK.

MONDAY, March 4	Entomological	8 P.M.
TUESDAY, March 5	Horticultural	3 P.M.
	Linnæan	8 P.M.
WEDNESDAY, March 6	Society of Arts	8 P.M.

A LETTER from a "Manchester Gardener" reminds us that our remarks on PINE GROWING are not yet brought to a conclusion. The object of his inquiry is to ascertain whether the large Pines that have of late excited so much surprise are as well flavoured as smaller ones. The answer to that question is in the affirmative, as far as regards the Pines obtained at Bicton and Longleat. The latter we saw, and it was impossible to conceive Queens more perfect in all respects, fragrance, and therefore flavour, included. We are informed, upon evidence which we cannot question, that the same good qualities existed in the fruit obtained by Mr. W. Barnes; but, as we have repeatedly stated, we have no personal knowledge of the fact. As to other large Pines grown in other places, we have cautiously abstained from alluding to them much, because we understand that in some cases they have *not* proved of good quality. It is sufficient to know that the Queens at Longleat and Bicton were perfect; and on them we rest, and always have rested, our case.

And now a word with regard to the general question. What we have insisted upon is the *possibility* of growing Pines better than they have been ever grown before, unless in a very few exceptional instances; the *probability* of the whole system of cultivating this fruit being affected by the discovery of such a fact; and the *necessity* for those gardeners who fancy that they have arrived at the end of what there is to know bestirring themselves to improve their practice, if they would not be outstripped by better growers. The result has been exactly what we anticipated. Sensible men have betaken themselves to consider how far it is advisable or practicable to follow the advice that has been given. *They* never dreamed of taking to themselves the sharp remarks of ourselves and Mr. Barnes, for they felt that they in no way deserved them—and they were right. But the foolish drones clapped the cap upon their heads, found that it fitted them exactly, and were prodigiously annoyed at discovering that they could not take it off again. We trust they will continue to wear it, as a mark by which their neighbours may know them. We may possibly hereafter offer some other articles of dress for their acceptance.

Two things should, we think, be obvious. The first, that it may not be always as desirable to grow very large Pines, as it is to know how to do it; the second, that no one would expect them of a gardener whose master objects to supplying the necessary means.

What a gardener should do, is to set before his master the relative expense of growing Queens to the weight of 3lbs. or 4lbs., and 6lbs. or 7lbs.; and then to inquire which he prefers. In the majority of cases, he would find his master preferring the smaller size, *if well grown;* because it is only on special occasions that very heavy Pines are really wanted; and always to place on the table a Queen of 6lbs. weight where one of only 3 lbs. is required would be unnecessary waste. There is, however, no family where Pines are cultivated, in which it is not wished to have the largest possible fruit *occasionally*. If it were not so, the Providence and Enville Pine Apples, which have nothing but size to recommend them, would go out of cultivation. Again, the surplus Pines in many gardens are regularly sent to market, and in that case it would have to be ascertained which is the more *profitable*, a crop of very large, or of middle-sized, well-grown Pines. And it is in this way that market-gardeners probably view the question. They grow what best suits the market, and what will produce them the most profit. They may say that they could do better if it were worth while; and perhaps they could.

When, however, we look at the way in which the markets are supplied with Pines, it is impossible to compliment the growers on their skill. Often, indeed, one sees fair fruit; but anything very remarkable is rarely met with; and a large proportion consists of what we should not consider fit for any other purpose than that of the confectioner. This arises from nothing but want of skill on the part of the growers; for most assuredly good management will produce well swelled Queens from 3lbs. to 4lbs. at the same expense as is now incurred in obtaining ill-grown fruit of less than half the weight.

The man who *can* grow a crop of six-pounder Queens could never, under any circumstances, produce such things as we now see in too many places. Pine-growers should imitate the florists; they should place their standard of perfection very high, and should strive to approach it as nearly as they can, without being discouraged if they do not reach it.

WHEN we consider the infinite variety of objects presented to the eye in all the varied scenery to be found on the earth, it becomes clear that man must be endowed with faculties enabling him to derive pleasure from contemplating them. It is not enough that man should perceive there are things present external to himself; he must have power to distinguish one thing from another. Seeing the necessity of this, it is proper to consider what these powers are, before we think of their exercise in the profession we are attempting to illustrate. This is rather an extensive range of subject, but we shall be brief, studying merely to give useful hints, and leaving those who may feel desirous of deeper research, to satisfy themselves by applying to special sources of information.

After the perception of the presence of an object,—its occupation of space—perhaps we regard the secondary one to be its magnitude in comparison to our own dimensions, or to those of other objects. We have, therefore, a faculty to perceive magnitude or size, and a faculty to compare one magnitude with another. The next perception may be that of the boundaries or outline of the object—that is, its form, or shape. Here we speak merely as if the object were flat. When an object is not flat, but a solid, we are enabled to discover the entire form by the assistance of light and its degree of dilution; in ordinary language, shade. Though shade be essentially shadow, it is a useful conventional term to distinguish when it relates to the parts of form which it brings out to the eye; while shadow is employed to denote the effect of interruption of light by an entire mass of matter independently of every part of its form except the outline. The ascertainment of form by the sense of touch we need not consider; for, Landscape Gardening has to do only with perceptions excited through the eye. We have, then, a mental faculty, enabling us to distinguish forms which are of endless variety, made up of lines and surfaces, straight and curved. Outline depends on form; and, therefore, when agreeable outline is required in a landscape, selection is to be made of objects having forms suited to produce it. But it must be observed, care should be taken in selecting forms for an outline, that they are in other respects suitable to the position in which they are to be placed, and not disagreeable in themselves individually. Hence, this faculty of form must be possessed in a high degree by the Landscape Gardener; so that this perception may be quick in regard to the supply of what may be wanting, and to the removal of what is unsuitable. There is, besides, a perception of harmony required—of suitableness—of fitness, independent of simple form. There is, in the combinations of forms that which may be pleasing, and that which may be offensive. Indeed, in this consists the chief power of a Landscape Gardener who is fitted by nature to follow the profession. Metaphysically speaking, it is probable that this perception of harmony may belong to the faculty of form. It may be a faculty independent of it, but it is claimed by others also, and on that account seems to be an adjunct, or even an integral part of each. The phrenological faculty of ideality scarcely seems to embrace it, though it may assist the function; and without further discussion we hold it for the present as belonging to the faculty of form—but not exclusively.

It is obviously necessary to the Landscape Gardener to have an acute perception of the relative position of objects. This is undoubtedly a special faculty, and to it belongs the memory we have for places, and the power of finding our way. In grouping, objects may be placed incongruously in relation to each other, however agreeable their forms may be individually. If we feel pleased with one mode of grouping a certain number of objects, and displeased with another mode, it is obvious we possess a peculiar faculty different from simple comparison—one which enables us to derive satisfaction of a distinct kind from the perception of a particular arrangement.

There is another faculty connected with arrangement, and meriting special attention, and with which we will for the present conclude. We refer to the faculty of Order, or we may, perhaps, rather name it Symmetry. The disposition to keep things in order, that is, in their proper places, is not what is meant; but the arrangement of objects according to size and form. For example, let us take four objects of the same height, and four that are taller. In arranging them we may set down a tall one, then two short ones, next to them two tall ones, then two short ones, and lastly a tall one, ıılıılı; or, two tall ones, four short, and two tall, ılıılıı; or two short, four tall, and two short, ıılllıı; or one short, two tall, two short, two tall, and one short, ılıılıı; all these are symmetrical. But other arrangements, such as ıılıılı, lllıılı, ıılllı, and so on, are not symmetrical. The faculty which leads us to observe symmetry is more necessary in Architecture than in Landscape Gardening; but still it is necessary, if for no other reason, in order to put the practitioner on his guard against stiffness, which is the result of too great a predominance of the faculty. The Landscape Gardener, however, ought to be able to perceive it, to make use of it where it may be proper, and avoid it where it would be absurd. Some of our readers may know the anecdote of a worthy Gardener who had this faculty in a high degree. It happened that the stocks were placed at a corner where one road branched off from another, not far from the residence of the gentleman whom he served. They had long been disused; one morning, for the first time, our gardener saw a man locked into them, rendering the whole thing very conspicuous. Towards evening his master happened to pass that way, and was surprised to see stocks on the other side, and a man in them also. He asked the gardener if he knew the cause of this, when he replied that he had considered it very awkward to have a man in the stocks only on one side, and that he had caused the carpenter to make another, and hired a man to stand in it, for the sake of uniformity.—*G.*

ON THE DISEASES OF PLANTS.

A LARGE class of the diseases which affect plants, and that a very formidable one, both as regards number and their disastrous consequences, is attributable to the attacks of various species of Fungi. To them, no less than to the minuter insects, are due many of the appearances which are known and dreaded by cultivators under the name of Blight, though frequently without the slightest suspicion as to their nature or origin. The noxious parasites themselves are many in number, and various in structure. There is no part or organ which is not, during some period of its growth, subject to their ravages. The leaves, the flowers, the anthers, the germen, the seed, the softer portions of the stem, or even occasionally the woody twigs and smaller branches; the roots, and finally the harder internal tissues, are in their turn affected by some one or more of these enemies, and in many cases totally destroyed by their agency. Nor are their attacks confined, as has been often supposed, to unhealthy organs or individuals, though there may often be a morbid condition of the plant predisposing it to such attacks; for it has been shown that where, under favourable atmospheric conditions, the spores, or reproductive organs of these productions have germinated, they have in many cases a power of establishing themselves upon the most healthy living tissues, and this not only in the vegetable world, where it, perhaps, may not appear surprising, but even in animals in full health and vigour. Mr. Hassall has shown, in a series of papers read before the Microscopical Society of London, and in specimens handed round at one of the meetings of the Linnean Society, that perfectly sound fruits are soon completely destroyed if inoculated with certain species of mould; and these observations have since been extended by him as regards Lettuces, and other vegetables, as were published in Aug., 1843, in the "Annals of Natural History." Effects like these had previously been produced by Messieurs Audouin, Bassi, and Balsamo-Crivelli, especially the former, whose papers in the "Annales des Sciences Naturelles" are well worth attention, by the inoculation of the mould (Botrytis Bassiana), which commits such ravages in silk-worm establishments, both before and after the spinning of the cocoon. And not only were the caterpillars of the silk-moth affected by this inoculation, but those of other moths; and, in some cases, other species of mould were developed from their internal tissue when exposed to the air. A familiar instance of this living death may often be seen in autumn in the case of flies, which, under the attack of some species of Fungus at present imperfectly understood, glue themselves by their proboscis to the ceiling, to leaves, pieces of string, or other objects that fall in their way, and then patiently wait for the consummation of their disease. Dr. Hannoon also, as recorded in "Muller's Archives for Anatomy and Physiology," succeeded in inoculating living salamanders, some of which died in consequence of the development of the mould. As this Fungus is very easily raised in a glass tube without any organic matrix, provided the air within the tube be of the proper degree of moisture, as has been shown by Dr. Montagne, it is not improbable that it would establish itself likewise on vegetables; but I am not aware that any experiments have been made on this point. And this would be the more likely, if, as Dr. Montagne supposes, it may possibly be the same species with Botrytis diffusa, though I am myself inclined to think that the latter species has a far more complicated structure. The subject, indeed, is one which deserves far more attention than it has hitherto received, and which is likely to repay well the labours of any patient and accurate observer; and though the spores of Fungi may not be so injurious as might be supposed from an opinion which I heard maintained by persons of considerable scientific attainments in France some years since, when the influenza, or, as it is called there, *la grippe*, was so prevalent and fatal, that it arose from the multi-

tudes of the spores of Fungi floating in the air, after a great Fungus season, which induced a diseased action of the lungs; still the numerous facts which have been brought forward of the effect which these bodies produce on animal tissues even of the higher tribes, seem at least to intimate that their effects, even as regards the human frame, may be of more importance than is generally suspected.

Their effects on plants are too evident to be denied, however difficult it may be in many cases to understand the phenomena which are presented to our notice. The contemporaneous but independent discoveries, however, of Léveillé and Corda as to the penetration of the mycelium of the Fungi, which produce rust and mildew, into the tissue of the plants, and its presence in those tissues before the actual appearance of the Fungus externally (discoveries which were in part anticipated, perhaps, by Dutrochet in his "Observations on Moulds," and by Balsamo as regards Botrytis nivea, Martius, a species which originates beneath the cuticle of the common Shepherd's-purse, but finds its way through the stomata without bursting the outer integument), have removed some of the difficulties which are connected with the subject, and will doubtless lead to a more accurate knowledge than at present exists respecting it. These phenomena are indeed in some cases so puzzling, that Hartig in the case of those Fungi which prey upon the woody fibre, and Unger as regards those which are more connected with the softer cellular tissues, have considered them, in accordance with the notions so prevalent with German Botanists as to the production of the lower orders of plants and animals, as absolute transformations of such tissues; an opinion exactly parallel to that of Dutrochet on the development of the globules of milk into a mould, and of Balsamo of the transformation of the particles of the fatty substance of caterpillars into the Botrytis.

We shall have occasion hereafter to advert to the opinions of M. Unger, which the discoveries of Corda and Léveillé have shown to have been put forward with a very imperfect knowledge—doubtless from want of a good modern microscope—of the real structure of the productions he was considering. The importance, indeed, of these discoveries cannot well be overrated, not only as regards the questions which arise of a more purely scientific nature, but in all considerations of the mode in which plants are attacked by parasitic Fungi, and the remedies which may be adopted against them. It is far from improbable that Unger may be again induced to take up the subject, and if so, we may be sure that it will not be without some interesting results, for it is very far from being exhausted. Within the last few weeks Dr. Montagne informs me that he has made some observations on the development of the spores, which bid fair to be of much importance. Of these a slight intimation has been given in the article Cryptogamie, published in the last Number of the "Dictionnaire Universel d'Histoire Naturelle." A fuller version will, I doubt not, soon be published.

It is proposed, as part of a series of papers on the diseases of plants, to give as far as possible in a popular form, accompanied occasionally by illustrations, an account of those maladies which arise from the influence of Fungi. This will, I hope, prove so far interesting, as to elicit many important observations from practical persons, whose attention perhaps may not have been called closely to the subject, and remove from some minds the prejudices which have so long prevailed respecting the origin of these diseases. I cannot make any pretensions to novelty or original research, but the object in view will be to point attention to such points as may be most likely to instruct and interest.

The most convenient course will be, with a view to avoid unnecessary repetition, to take the noxious Fungi in systematic order, commencing, however, with those which are lowest in the scale, though in this point of view the most important. I shall, however, first state briefly the effect on plants of other cryptogamic productions, which would perhaps not easily be included in any other division of the series; and then, as prefatory to the main subject, give a very concise sketch of that class which is to occupy principally our attention.—*M. J. Berkeley.*

PLAN OF WARMING A PINERY AND PITS, BY HOT WATER FLOWING IN GUTTERS;

Without any Fermenting Substance being used.

AS EXECUTED BY MR. FOSTER, GARDENER TO THE VISCOUNT DOWNE, BENNINGBROUGH HALL, NEAR YORK.

PLAN OF PINERY, showing the situation of 60 Pines placed above the Gutters; also the Plugs for steam.

Explanation of Plan & Section.

AAA Gutters 6 in. wide and 13 in. deep, built of brick lined with Roman cement, to warm the air of the house, also to moisten the atmosphere when required, by removing the slate covers.

BBB Gutters upon which the Pines are planted without pots; they have also 4-in. upright pot-pipes, with movable plugs, for steaming, marked C on the Plan. All the gutters are covered with thin blue slates steam tight. This house having been erected late in the autumn, there is sufficient moisture without removing any slates or plugs.

DDD Concrete, without lime, to allow the heat to pass into the earth above.

EEE Valves to the pits, now open, showing Nos. 1 and 2 being heated.

FFF Valves, now shut, showing Nos. 3 and 4 not being heated.

GG Stones into which the iron pipes are fitted, with flanges, water-tight.

REFERENCES.—The heat at the roots of the plants 6 inches below the surface of the pit is 95°. The heat of the air of the house from three gutters, without any flue, is from 60° to 65°. Of the Pines placed in the house, some had shown fruit, some were showing, and others not; of those that had shown I never saw any make such progress in the height of the season; those that have shown since planted have come up remarkably strong; those plants that have not shown have made rapid growth, and no doubt will show fruit soon.

FAMILIAR BOTANY.

Morphology.—No. V.

[A kind friend has furnished us with the following, which we think it better to insert before proceeding with *R. E.*'s papers.]

"I fear that very few of your readers will be induced to study Mrs. Austin's literal translation of Goethe's 'Metamorphose,' as it is given by your friend *R. E.*, in last week's *Chronicle*, enough to discover the full meaning of the author, physiological or poetical. Or they will perhaps be inclined to say, with *Mr. Dangle*, in 'The Critic,' that 'the interpreter is the hardest to be understood of the two.' The following attempt to make the translation more readable is at your service. I only hope that as Mr. *R. E.* has *under*-rated his own powers of diction, I may not have *over*-rated mine. I beg to say, in addition, that I have not the original German by me to assist me, and that it is a long time since I read 'The Botanic Garden,' in which I think the same subject is very Goethistically wrought out."—*P. P.*

Mark by what slow degrees, but ceaseless force,
The husky seed unfolds its tender charge
Of leaf and blossom, and enduring fruit,
When urged by earth's all-fructifying juice,
And more attractive light,—life-giving light,
Holy and pure!—Till now, the nascent power,—
Mysterious germination,—slept unseen;
And root, and leaf, and bud enfolded lay
Enshrined within their husky tenement,
(Incipient foretypes of the coming plant,)
In silent life, half formed and colourless;
But soon, repleted with earth-giv'n moisture,
It lifts itself above surrounding night,
And breathes the incense of the open day.
Still is its early dawn distinguished
By simple forms; for even plants confess
By simple forms prepared for all things earthly born.
The Infancy
Quickly proceeds the growing impulse then,—
Joint upon joint, and leaf on leaf arise,
In order predetermin'd,—not of chance,
But variously unfolding, points and parts,
And tangled edges,—parts unseen before,
Scarce moulded yet within the parent stem.
So step by step the vegetable wonder draws
Its great completion: ribbed and indented,
On the exuberant stem it stands secure,
And challenges the soul to admiration.
But Nature now with powerful hand arrests
The quick enlargement; gently she leads on;
In smaller channels, and for nobler ends,
Diverts the all-important sap; and now,
The ranker vegetation binding those,
Structures more perfect, more elaborate spring.
Quickly the slender flower-stalk starts to view,
Leafless and bare; save where in subtle shapes
The curious eye detects the tiny forms
That circle round the head, innumerous;—
Leaflets compressed, in sheltering calyx bound,
Each like to each, in stated order set.
The crown unfolds, the calyx gently yields
Its many-coloured charge; and Nature now
Blooms in her gay, magnificent attire;
Ever anew thy admiration moving,
As limb on limb upreared, the noble flower
Waves o'er its frame of ever-changing leaves.
But still this glorious show but heraldeth
New operations,—with all-powerful hand
The work proceeds: the many-coloured leaf
Retires abashed, and tender forms crowd round.
Affianced couples they, claimants intent
On Hymeneal rites, whose quick'ning powers,
(Delicious odours streaming all around,)
Perfect the destined union. Now compact
Together swell the teeming germs; with fruits
The bounteous mother's well-filled lap o'erflows.
Nature's eternal circle here is closed:
But straight renewed,—another ring succeeds.
Link within link entwined, the chain 's prolonged
Throughout all Time,—to all, and sev'ral given,
Life within life—a Being infinite.—*P. P.*

Home Correspondence.

Heath Edging.—It is observed by Dr. Hooker, in his "British Flora," page 181, that Calluna vulgaris makes an excellent edging to garden-plots, and bears clipping as well as Box. The superiority of Heath as an edging is farther confirmed by a recent notice in the *Gardeners' Chronicle*, stating "that Heath-edgings have been successfully introduced into the Speaker's gardens at Heckfield-place." About four years ago edgings were required in the Speaker's gardens, and in the adjacent common a few patches of young Heath were found that had sprung up where the surface of the ground had been pared off a few years before; from these an edging was formed by cutting the surface into narrow strips, about two inches wide and two deep. Those pieces, on being brought to the garden, were laid in a line, and formed the edging at once. The ground was previously prepared for their reception, and some Heath-mould was added to encourage growth. The Heath is cut twice a year, and forms a neat and pretty edging. For this purpose Heath deserves more attention than has hitherto been given to it, and I hope to hear further particulars respecting its utility.—*Thomas Berry.*

Lily of the Field.—I have seen it mentioned in the *Gardener's Chronicle* that most probably the Ixiolirion montanum, which is I believe a beautiful Amaryllis with a pale-blue flower, is the plant alluded to in the New Testament as "the Lily of the Field," surpassing the glory of Solomon when arrayed in all his splendour. I met with a passage the other day, militating against this idea, which I think you may like to have pointed out. The passage I allude to occurs in the 9th of St. Cyril's "Catechetical Lectures" (Oxford ed. in "Library of the Fathers," page 94). The Bishop was pointing out to the catechumens the power of the Almighty as displayed in the things which are seen. "Contemplate," he said, "the spring, and the flowers of all kinds, in all their likeness still diverse from one another; the deep crimson of the Rose, and the exceeding whiteness of the Lily. They come of one and the same rain, one and the same earth; who has dintinguished, who has formed them?" &c. Cyril is said tohave delivered these Lectures in Jerusalem about A.D. 348, and he was likely therefore to have alluded to the same kind of Lily—one no doubt well known—as that on which our Lord based his remark. I own I feel some doubts whether the word "whiteness" in the extract is an accurate translation of the original; the Greek word might perhaps only express "pureness," or "clearness;" but as I have not the Greek original to refer to, I cannot satisfy myself on this head.—*F. S.* [All speculations as to what the Lily of the Field may have been, are set at rest by the discovery that our Saviour *must* have referred to the Lilium Chalcedonicum, as is proved at p. 854 for 1842.]

Analysis of the Raspberry.—The following is the analysis of the Raspberry, which I extracted from some work; but the authority I neglected to note down, viz.:—

Silicic Acid	0·25
Phosphate of Lime	3·65
Carbonate of Lime	3·40
Potash	5·24
Soda	0·50
Ox. Manganese	1·00
	14·04

It was stated that the Raspberry most generally springs up where fields had been burnt over, and also by the sides of decomposing stone walls.—*W. P. Keane, Leybourne Grange, Town Malling, Kent.*

Large Pine-Apples.—Respecting the large Pines mentioned at p. 102, in addition to what is there stated, Mr. Dixon wishes us to publish the following, viz.:—"That the gill suckers were heartless, and of very small size; that the weight of the suckers on the one weighing 11 lbs. 15 oz. was 3¼ oz.; and that those which grew on the one weighing 14 lbs. 12 oz. were very small and quite heartless."

Melons.—In answer to your correspondent, who asks which is the best Melon for preserving, "M. P." begs to state that she has tried several, and that none answer the purpose so well as the old Rock Melon.——Another correspondent confidently recommends the Yarmouth Prize Melon for preserving, and Mr. Sherwood, of Stamford Hill, states that the best Melon he has ever grown for that purpose is Cuthill's Early Melon. He informs us that it is well flavoured, has very thick flesh, that it is a great bearer, and ripens earlier than any Melon he has tried.

The Gladiolus.—I have read in the *Chronicle* lately an extract from J. de Junghe, in the *Revue Horticole* for Sept. 1813, headed *The Gladiolus*, which contains many inaccuracies. In the first place, Gladiolus communis, which is a native of the south of Europe, is much less common at present in the gardens of England than Byzantinus, being less hardy and liable to perish. That "these two species have afforded a great number of varieties of different colours, such as White, Rose-colour, Orange and Vermilion, Purple and Lilac," is utterly unfounded. There exist no varieties of G. Byzantinus in the gardens. There are several natural varieties of G. communis from different localities in Italy, but they are little known, and afford no great variation of colour, except a whitish one. G. segetum, which has the seed without the winged or foliaceous margin, has a white variety, which M. Bouché makes a distinct species, but to which no native locality is assigned. G. Boucheanus, crispiflorus, caucasicus, and some other natives of Europe and Western Asia, are unknown to M. de Junghe, but do not afford the colours which he mentions. The plants of various and brilliant hues to which he alludes are those which were raised by myself, when I lived at Mitcham, about the year 1810, between G. cardinalis, blandus, angustus, and tristis. The intermixed produce from their seed, which is furnished abundantly, and the produce of similar intermixtures has been obtained by other persons from the same plants since. Other crosses were made about the same time by me at Mitcham, but are less known. The plant named G. floribundus, and so called by most vendors, is totally unlike G. floribundus, which is an old Cape species, figured long ago in the *Bot. Mag.* The published name of the G. floribundus of the shops is G. oppositiflorus. It is a native of Madagascar, and probably of the Natal colony also. It was found to breed readily by intermixture with the Cape mules, and the species from which they were produced, as well as with G. natalensis, otherwise called Psittacinus, or Dahleni. The crosses are as much English as Belgian productions. The G. ramosus of the shops, which varies in colour in different individuals, is a cross between G. oppositifolius and the mules by G. cardinalis and cardinalis itself. It thrives much better in Belgium than with us, because the soil there suits it better. Many such, and some handsomer, with an intermixture of tristis, have been raised and flowered by me, but are very subject to perish in my soil. The Gladiolus, called Gandavensis by Mr. Van Houtte, of which he is stated to possess the whole stock, was raised abundantly by me, being the produce of G. oppositiflorus by Natalensis, but it did not thrive as those raised in Belgium. Some, however, which were raised as early by Mr. Bidwill in this country, and taken by him to Sydney, far exceeded the Belgium plants in growth and vigour, and the roots thereof brought back by him from thence flowered with greater strength than those for which I was indebted to Mr. Van Houtte; some were exactly similar to his plants, and one in particular with a very different posture of flower. I have now seed obtained from his bulbs set last spring in Devonshire, crossed a second time by Natalensis. As yet I have no cross on the correctness of which I can rely between Natalensis and any Cape species or mule; nor between any Cape species and species of the Northern hemisphere. G. Colvilli is one of the best varieties of the crosses of tristis with cardinalis and cardinali-blandus. The formosissimus mentioned is one of the Cape mules, but inferior to insignis.—*W. Herbert, Manchester.*

Seedling Auriculas.—I took several pots of green-edged Auriculas, and placed them together in a shady place, giving all possible air. As they came into bloom, I pulled off all the flowers from every Self and Alpine. I had seed enough, but among the seedlings only one proved an Auricula, with a gray edge, indeed, but worthless. The rest were all Alpines and Selfs, of better properties than I had met with in seedlings raised from Alpines. Some of them had nine or ten petals.—*O.*

American Bug.—The following is from "Waterton's Essays on Natural History," (3d edit. p. 276). After mentioning several ineffectual applications, such as unctuous preparations, decoction of Walnut-leaves, spirit of turpentine, for destroying the downy white insect or American Bug on Apple-trees, the author says:—"Despairing of success, I was on the point of quitting the field and leaving the Bugs in undisturbed possession of it, when I began to conjecture that I had not gone the right way to work. I reflected that none of my applications could have penetrated sufficiently deep into the curved and knotty sinuosities of the diseased parts, and that on this account there would be a sufficient force of the enemy left alive to recommence its depredations at the first favourable opportunity. Wherefore I concluded that nothing short of the entire destruction of the eggs, the young, and the adult, could save the trees from ultimate ruin. Knowing that the Bug could not exist if totally deprived of air, I resolved to bury it alive, and this I effected by an application, at once the most easy and simple that can be imagined—it costs nothing. I mixed clay with water till it was of a consistency that it could be put on to the injured parts of the tree, either with a mason's trowel or with a painter's brush. I then applied it to the diseased places of the tree, and it soon smothered every bug: a second coat upon the first filled up every crack which showed itself when the clay had become dry, and this resisted for a sufficient length of time the effects both of sun and rain. The sickly parts, now effectually freed from the enemy which had been preying on their vitals, were placed in a state to be cured by the healing process of Nature, and that Nature has done her duty, my Apple-trees amply testify."—*Vertumnus.*

Hampton Court.—In reference to Hampton Court I should be so sorry to see "Q.'s" wishes on the subject realised—not that I think there is the slightest chance of it—that I hope you will allow me to address a few words to your Journal, of which I am a constant reader. Did it ever occur to him that there are thousands of shopkeepers' clerks, men of business and different professions, who are occupied during the whole day for every day of the week? That Sunday is the only day on which they can take a walk with their families, and breathe the fresh air after inhaling the smoky atmosphere of London for six days? Is it ungodly or profane for them to admire the fresh green Grass—the fine old trees—those temples not made by hands—to feel what a beautiful world this is, and bless the God who made it? Does the cheerful voice of the young visitors grate upon his ear, that he calls them profane and a nuisance? I always make a point of going to church on a Sunday; residing in London I have been all my life fond of every plant, from the Oak to the Lichen, and the pleasure I feel in a ramble about the walks of Hampton Court and Bushy Park is no doubt equally felt by hundreds there. I always found I had plenty of time to go to church also, and it certainly never occurred to me that I was a sabbath-breaker. I am sure that her Majesty, who, as "Q." says, is "the head of the truly Apostolic and purely spiritual Church," is well aware that the best way to make her subjects love and fear God, and be dutiful to herself, is to give them the means of innocent amusement, and of cultivating the purest taste—that for Nature—and that they will be encouraged to show their happy faces, free from care for one day in the week, in Hampton Court. As for the respected gardener there, I should doubt much whether he will thank his friend for bringing this forward; he must have known what would be required of him, and of course need not stay there longer than he likes. I fear "Q." is of a sour disposition; I really should be almost afraid of his blighting the plants if he was my gardener.—*βρ.*——A second communication is as follows:—"I regret to observe that your correspondent "Q." should have made such bitter complaints on the practice of opening these gardens to the public on Sundays. I would ask how professional men, tradesmen, assistants in shops, &c., can have a more innocent recreation than enjoying a walk with their families in the Palace gardens after being confined closely to business during the whole week, without any opportunity of breathing fresh air? Is it fair or charitable to style such people a host of ungodly, profane sabbath-breakers? I strongly suspect "Q." to be from the north side of the Tweed, by such a display of the narrow bigoted spirit of Calvin and John Knox. With regard to the gardeners, why cannot they take turns of duty every alternate Sunday, or every third week? Thus they might attend Divine service without hindrance, and spend the day as they wish."—*C. D.* [Having allowed the letter of "Q." to appear, we cannot refuse insertion to these; but we feel that the subject is not suited to our columns, and therefore we would beg our correspondents not to carry it further.]

Societies.

BOTANICAL SOCIETY OF LONDON.

Nov. 29, 1843.—Seventh Anniversary Meeting. The Treasurer in the Chair. From the Report of the Council it appeared that 13 new members had been elected since the last Anniversary, and that the Society now consisted of 159 members. The Report of the Herbarium Committee was read, and stated that many interesting British plants had been presented, including several species of Carices collected by the late Mr. G. Don, which were

presented by Mr. S. P. Woodward. Specimens of Carex paradoxa (Willd.), Borkhausia setosa (D. C.), Spiranthis gemmipara, Convallaria bifolia, Statice rariflora, and other valuable plants, had been received. Mr. Edwin Lees had presented a collection of British Rubi, comprising nearly all the species. Numerous interesting Irish plants had been received from Mr. Andrews, including many duplicates of Trichomanes speciosum. The plants sent to members in return for their contributions had given much satisfaction, and in nearly every instance the Committee were enabled to send the return parcel within a fortnight after the receipt of the contributors' own parcel. Since the printing of the catalogue of British plants, now used by the members in marking their *desiderata*, several new species have been added to the Flora of this country, which of course do not appear in the catalogue. As far as these novelties can be obtained, the Committee will distribute them through the parcels sent out to contributors, together with any other specimens which may afford the opportunity for correcting errors of nomenclature, or in any way elucidating the Botany of Britain. For the common benefit of members it is particularly requested that contributors will send as many duplicates as they can of all such novelties. Among the specimens now ready for distribution are the following:—A few specimens of Statice rariflora, obtained through the kindness of Mr. Notcutt; an ample supply of the true Crepis biennis, presented by the Rev. A. Bloxam; the true Primula elatior (Jacq.), received from Mr. E. Doubleday, together with the varieties of P. vulgaris, which are often mistaken for the former. The true Eriophorum gracile (Koch.) known to very few English botanists before the summer of 1812; Linaria spartea, naturalised at Walton in Surrey; Bromus commutatus (Schrader), so very frequently misnamed B. arvensis (Lerou); varieties of Betula alba, which are described as species by several botanical authorities; Festuca loliacea passing into F. pratensis. The original labels are carefully preserved, and those which are not required for introduction into the reference Herbarium, along with the specimens will be fastened into a book, as a permanent record of localities. Dr. Ayres has sent a portion of the Flora of Thame, Oxfordshire, and engaged to complete it; and a full set of the flowering plants of Esher, in Surrey, has been collected, and will be sent to the Society as soon as they can be glued down in the manner prescribed by the committee. Other members are collecting the Herbaria of their respective districts, and the committee hope next year to report the addition of several Local Herbaria. The Foreign Plants received far exceeds that of any former year. The Horticultural Society of Cornwall had sent a very large collection of East Indian plants, comprising specimens collected at Madras by Dr. Wight, and at Assam by Major Jenkins. A very large collection of North American plants had been received from Dr. Gavin Watson and Mr. R. Kelvington, and Mr. E. Doubleday had presented 300 species from Ohio. A collection of specimens from Western Australia had been presented by Mr. Turner, and Mr. Gerard had sent valuable plants collected at Sierra Leone. British Ferns have been received from various members, and in every instance where specimens have been received from localities not hitherto recorded in the collection, the most characteristic have been selected, and introduced in accordance with the principle laid down by the committee, of extending the series to every locality that can be obtained for the rare species, and every county or district for the more abundant. It has also been made an object to ascertain the geological range of each, as well as its geographical distribution. The abundant supply of Lastræa cristata, Asplenium lanceolatum, Adiantum capillus, Veneris, and Trichomanes speciosum, has enabled the committee to distribute them to all who applied for specimens. The following Mosses, new to the British Flora, have been presented by Dr. Thomas Taylor. Trichostomum saxatile (Taylor, M.S.), and Bryum recurvifolium (Taylor, M.S.), and the following new species of Hepaticæ, Jungermannia reclusa, fragilifera, germana, and riparia together with authentic specimens of the new Dicranum scoparium, and Dicranum Dillenii. Mr. G. H. K. Thwaites has sent a large collection of Mosses, chiefly collected by him in the neighbourhood of Bristol, including many new species. Dr. Ayres has forwarded specimens of Hysterium rubrum and Peziza caulicola, discovered by him in Oxfordshire. In concluding their Report the committee called upon the members for renewed exertions to make the collection forming by the Society as complete as possible, and to render their Herbarium a permanent standard for the determination of plants; and members and contributors are particularly requested to send monstrosities and any specimens differing from the common form. The reports of the council and Herbarium committee were unanimously adopted; a ballot then took place for the council for the ensuing year, when J. E. Gray, Esq., was re-elected president. John Miers, Esq., J. F. Young, M.D., and A. Henfrey, Esq., were elected new members of the council in the room of G. Francis, Esq., H. A. Meeson, M.D., and Adam White, Esq., who retire. Messrs. Reynolds, Dennes, and Sansom, were respectively re-elected Treasurer, Secretary, and Librarian.

Dec. 13.—The president nominated Hewett C. Watson, Esq., and John Miers, Esq., vice-presidents.

Reviews.

Upon the Growth of Plants. By Julius Munter. (Botanische Zeitung, 1844.)

THE Author of this paper has previously made communications to the "Botanische Zeitung," on the growth of the various parts of plants, and refers to the papers of Schmitz in the "Linnæa," and of Harting in the "Tydschrift voor Natuurrlyke Geschiedenis en Physiologie," as contributions to the same subject. Schmitz's paper was on the growth of Fungi, and Harting on the influence of external agents on the growth of plants, such as the time of the day and of the year, the degree of warmth, the dampness and dryness of the atmosphere, and the influence of a quiet or ruffled atmosphere. The author has repeated most of the experiments of Mr. Harting, and in this paper makes remarks upon them in detail, and confirms their general results. He thinks that Harting has not duly estimated the influence of light on the growth of the various parts of plants. He had found, as the result of his own experiments, that a diminution of light had increased the growth of the internodes, as well as of the stem generally, whilst it greatly prejudiced the growth of the leaves.

In the author's previous papers he had given the results of experiments performed in his own room, where consequently the plants were exposed to little climatic change; but in the experiments detailed in this paper they were performed in the open air. The experiments are divided into two series; the first for the purpose of ascertaining the law of the growth of the internodes, the second for obtaining the same law in relation to the leaves of dicotyledonous plants. In order to ascertain the growth of the internodes, an internode was divided into equal parts, and measured at certain intervals. The plants thus experimented on were, the Acer pseudo-platanus, the Vitis vinifera, and Sambucus nigra. The following is an example of these tables. The plant was Vitis vinifera, and the internode was the fifth on a branch of that year's growth, *a* is the basis of the internode, *e* its upper part.

Day.	Weather.	Temperature. Reaumur.	a. b.	b. c.	c. d.	d. e.
June 13	Rain.	14·0	6 0‴	6 0‴	6 0‴	6 0‴
June 15	Bright.	15·0	8 0	9 0	9 5	8 5
June 16	Bright.	17·0	9 5	10 0	10 5	10 0
June 17	Bright.	18·0	11 0	12 5	12 5	12 5

From experiments thus performed, he comes to the conclusion that the extension of the internodes goes on at first in all parts, and first ceases at the base, whilst the upper parts still go on lengthening, and that gradually it ceases also in those parts. This remark, however, does not apply to the growth of the internodes of monocotyledonous plants. From other experiments it appeared that light prevents the growth of the internodes, as plants in the shade developed more space in the internodes than in the sunlight.

The experiments upon the leaves of plants were made in the same manner. The petiole, the midrib, and the lateral veins were marked off into equal spaces, and their growth observed from day to day. From experiments made upon the Hazel and the Vine, the author came to the conclusion that the petiole ceased to grow in a centrifugal direction, whilst the midrib and lateral costæ ceased to grow in a centripetal direction. In the simple leaves of the Hazel, the point of the leaf ceased to grow first, then the edge down to the base. The same took place in the lobed leaves of the Vine, the point of the midrib-lobe ceasing to grow first, and so on to the base of the whole leaf. The same results were obtained from experiments on the growth of the leaves of Ampelopsis quinquefolia. It might have been supposed that as pinnated leaves are considered only modifications of lobed leaves, that they would obey the same law of cessation of growth; but from experiments made on the leaves of Rhus typhinum and Fraxinus excelsior, it was found that the midrib of these leaves obeyed the law of the centrifugal cessation of growth, whilst the end and side leaflets ceased to grow centripetally. The paper concludes with a table of experiments on Acacia lophantha in proof of the correctness of these conclusions, and the author promises to pursue the subject further.—*L. E.*

EXTRACTS FROM NOTES OF A VISIT TO EQUATORIAL AMERICA, IN SEARCH OF PLANTS AND SEEDS FOR THE HORTICULTURAL SOCIETY OF LONDON. By Mr. T. HARTWEG.

(From the "Horticultural Transactions," Vol. III., Part I.)

I ARRIVED on the 3d of December, 1836, at Vera Cruz. Two days' riding, over a country without regular roads and through ravines, brought me to Zaquapan. For three leagues, from Vera Cruz to Santa Fé, the road lay over a sandy plain by the sea-side, covered partly by *Convolvulus maritimus*, a large round-leaved *Opuntia*, a *Croton*, and, above all, by *Mimosa pudica*. At Santa Fé the vegetation became more luxuriant, and the small shrubs were replaced by stately *Palms*, *Acacias*, several *Scitamineous* plants, and various *climbers*.

ZAQUAPAN is placed at an elevation of about 3000 feet above the level of the sea, on the eastern declivity of the snow-clad Orizaba, which attains the height of more than 17,000 feet; the climate is temperate, and the place surrounded with the richest vegetation I ever saw in Mexico. Upon leaving the savannahs, which are covered with a scanty undergrowth, I entered a forest of *Oaks* (*Quercus jalapensis*, *H.B.K.*) and there a change took place as it brought on by magic; *Orchidaceæ*, for which I had been on the look out since I left Vera Cruz, and of the finding of which I had given up all hope, considering the elevation I had attained, appeared here in the greatest abundance; the Oaks actually seemed to groan under their weight; *Maxillaria densa* and *tenuifolia*, forming festoons, and hanging gracefully over the branches they were growing on, seemed to strive with the larger species of *Tillandsia* for their existence. It was here I met with the beautiful and new *Cyrtochilum maculatum*, and the varieties of it now become so common. In the ravines or rocks I found *Maxillaria aromatica*, *Epidendrum seriatum*, *equitans*, *umbellatum*, *fuscatum*, *cochleatum* (this latter with nearly all its varieties), and *Acropera Loddigesii*. In the more exposed situations, particularly on trees overhanging the perpendicular sides of the ravines, *Stelis ciliaris*, *Dinema polybulbon*, *Isochilus linearis*, *Polystachya luteola*, and the little plant that now bears my name, *Hartwegia purpurea*, were common. The first plant of *Brassavola glauca* I met with was on a *Coccoloba*, in a wood descending to the savannah; but I afterwards found it on Oaks in abundance near this station. To grow this plant, as well as *Hartwegia purpurea* to perfection, I would recommend a temperature of 65–70° of Fahr., and to be kept in the driest part of the stove. The same treatment may be applied to the thick-leaved *Epidendrums* and *Oncidiums*. Near the same locality I found *Berberis tenuifolia*, forming a shrub 10 to 12 feet high, and at the time covered with its black berries on spikes more than a foot in length. In the more open places, among Grass, the *Cebadilla* or *Asagræa officinalis* was ripening its seeds on a stem four feet high; the roots, leaves, and particularly the seeds of this plant are used by the muleteers, in a state of fine powder, for killing the maggots in the wounds of their beasts, and occasionally an infusion of it is used in extirpating certain vermin which may be found on the heads of the lower class; but its employment is not so general as the occasion for it. The soap-plant, *Agave saponaria*, was found in the same locality, throwing up its flower-stem like a tuberose, to which, in fact, it bears much resemblance. Its thick, fleshy root crushed is a good substitute for soap, and is abundantly used by those who are too poor to buy that article.

[After quitting the city of Mexico] my first excursion was to the GIGANTE, the highest point of the range of mountains of Guanajuato, where I was rewarded with *Garrya obovata*, then in flower, forming a shrub six feet high; I afterwards found it more commonly on the Bufa, a bluff rock a league from Guanajuato. *Arctostaphylos pungens* has also been found in these stations, both in flower and fruit. *Berberis fasciculuris*, forming a shrub 8 to 10 feet high, was covered with flowers, as well as *Ribes campanulatum*. In another excursion I found, both in flower and fruit, a second species of *Garrya* (*G. laurifolia*) forming an evergreen shrub 12 to 15 feet high, with the *Madrono*, or *Arbutus densiflora*, forming a shrub, or small tree, covered with delicate white flowers. In the more sheltered situations, in the ravines near the town, *Clematis pubescens* was in full flower. *Oaks*, which cover the greater part of the mountains, were in great variety, but the acorns of the preceding year being all dead, I could procure neither seeds nor specimens. *Pines* were nowhere to be met with.

On the 13th of April I arrived in LEON from Guanajuato. The only things worthy of notice from this station were *Ipomæa longifolia* and *Lælia majalis*; the latter species I found at an elevation of about 8000 feet, growing on Oaks, and producing such a profusion of large pink flowers in May, that even the Mexicans find it attractive, and stick a few plants on the Limes (*Citrus medica*) growing before their houses. Of this I sent an abundant supply of plants, but as it has resisted all attempts at cultivation, I would recommend it to be kept in the driest part of the stove, and to be liberally supplied with water during the summer months only. In fields *Lupinus Hartwegii* was common; this seems to be quite stationary, having nowhere else been met with.

On the 17th of June I arrived at LAGOS, where I found the same barrenness during the dry season as at Leon; and after a month's fruitless wandering, I left, on the 13th of July, for Aguas Calientes. Of the more interesting plants found near Lagos I may mention *Milla biflora*, bearing from one to six of its star-like white flowers on one scape; *Bessera elegans* (*Caloprasum Geroltianum* of *Schiede*), the bruised leaves of which, mixed with a little water, are used occasionally for killing flies; *Zephyranthes sessilis*; *Sprekelia glauca*; and *Habranthus concolor*; the three latter flowering before the leaves appear.

At AGUAS CALIENTES I found a little more occupation, the rains having then set in; but being still dissatisfied with my excursions, I determined at once to leave the high table-land and proceed to Bolanos, where I should have the command of a vegetation from 3000 to more than 8000 feet of elevation. The town of Bolanos, where I arrived on the 4th of October, is situated in a deep ravine, about 3000 feet above the level of the sea, and from its confined situation has a higher temperature than might be supposed. The thermometer ranges from 39° to 85° Fahr. in the month of December, but in May it is from 85° to 95° Fahr., and even as high as 102° in the shade. The atmosphere being very dry is favourable to the growth of *Bromeliaceous* and *Cactaceous* plants, of which latter there is a great variety, especially among *Opuntias* and *Cerei*. Of the latter there are species which rise to the height of 30 or 40 feet, and yield an agreeable fruit of the size of a large walnut, with red or yellow pulp; they are known under the name of *Pitaya*. Here also occurred a species of *Agave*, with leaves six feet long by four inches broad, from which a spirit is distilled known under the name of *Vino Mescal*. When the plants are of a certain size they are taken up, and the stem, which is about 18 inches long, as well as the leaves, is cut off to the base, which gives the trunk a globular appearance. In this state it is roasted, then crushed, and after passing into the vinous fermentation, *Vino Mescal* is distilled from it. This spirit may be compared to weak whisky, but its strong smoky flavour renders it anything but pleasant. The plant I never could see in flower.

Ascending the steep sides of the ravine on the western side, I left the region of *Acacias*, *Bromeliaceæ*, and *arborescent Cerei*, and entered that of *Oaks*. After a four leagues' ride and constant ascent, I arrived at BERBERBA, the Mining Company's wood-cutting establishment, situate in the midst of woods at an elevation of more than 8000 feet above the level of the sea. Here I found, surrounded by evergreen *Oaks*, *Pines*, and *Arbutus densiflora*, the showy *Befaria mexicana*, forming a shrub of about 8 ft. high, and at the time covered with its large white flowers. The pretty little *Mammillaria senilis* I found on rocks in the more exposed situations; its long white spines, which at the points are bent backwards, seem to defend it against frost. In the more open places *Lupinus leptocarpus*, *Pentstemon imberbis*, *Lamourouxia longiflora*, and *multifida* were common.

On the 20th of February, 1838, I proceeded from Zacatecas over the high table land to SAN LUIS POTOSI, and thence to the Rancho de los Gallitos. Near San Luis Potosi I found *Berberis trifoliata* in great abundance, forming a shrub 4 to 5 feet high; it was then just coming into flower. The Rancho de los Gallitos, on the eastern declivity of the great table-land in a narrow valley, enjoys a delightful temperature, and is surrounded by constant verdure and noble forests of *Oaks*. It was near this station I found the striking *Berberis Hartwegii*, with its long spikes of flowers and pinnate leaves. This desirable species still remaining to be imported, I shall describe its locality particularly, for its seeds will amply remunerate any traveller that may land at Tampico and proceed to San Luis Potosi or Zacatecas. Before reaching the valley of Los Gallitos, on the ascent from Santa Barbara, there is a bluff rock on the right-hand side of the road, called "El Contadero," with a small chapel hewn in the rock, and always gaily adorned with flowers and candles by the passers by; this place is held in the deepest reverence by the Indians, from the circumstance of Nuestra Senora de Guadalupe being said to have appeared to several of them; and they cannot pass this place without paying homage to their protectress saint. It was at the foot of this rock that I found *Berberis Hartwegii*.

I now resolved to leave the arid plains in the north and proceed to MORELIA, the capital of the state of Mechoacan. The country about this town, from its broken surface, presents a beautiful vegetation; in the higher parts *Pines* and *Oaks* grow intermixed, and the latter are adorned with a great variety of *Epiphytes*. On the western declivity towards the active volcano Jorullo, I found *Pinus oocarpa* in great abundance, forming a tree 40 to 50 feet high; of this I secured an ample supply of seeds, but from its low situation, I fear it will not be proof against our northern winters. The cones of this Pine, after being ripe, will remain on the tree without opening for two or three years, and the seeds in them are equally as sound as the fresh ones. In the more elevated parts I found the showy *Fuchsia fulgens* in the greatest perfection, and beside it *Rigidella flammea*, bearing its bright scarlet flowers on a scape 3 to 4 feet high. In the more shaded places, the pretty little *Hydrotania meleagris* and *Arisæma macrospatha* were met with. In pastures, *Bravoa geminiflora* and *Cyclobothra barbata* were common.

After a two months' stay in this interesting country, I left for ANGANGUEO, at which place I arrived after a two days' ride over a mountain road, where I observed fine trees of *Pinus leiophylla*

and *pseudostrobus*, the former being called "*Ocote chino*," because, from its abundance of resin, it yields the best "*Ocote*," or candlewood; it attains the height of 100 feet, and is often 4 feet in diameter. *P. pseudostrobus* also grows in the same situation, and may be easily distinguished at a distance by its long slender branches diverging at a right angle from the main stem, as in the species of the section *Strobus*. Its chief range is about 8000 ft., while that of *P. leiophylla* is a few hundred feet lower. On an excursion to the "Campanario," the highest point of the mountains of Angangueo, I saw some remarkably fine trees of the "*Oyamel*," or *Abies religiosa*, 5 to 6 feet in diameter, and rising to the height of 150 feet. Its chief range is about 9000 feet above the sea; beyond that elevation its place is supplied by *Pinus Hartwegii*, rising to the height of 40 to 50 feet. With the latter I found *Veratrum frigidum*, the leaves of which are poisonous to cattle, *Muehlenbeckia macrostachya* and *Juniperus mexicana*, the latter forming a small straggling shrub 3 feet high.

On the 30th of Oct., 1838, I arrived at REAL DEL MONTE, after having crossed once more the high table-land of Mexico; but, as usual, without finding much to reward me. The town of Real del Monte, being situated at an elevation of above 8000 feet, is surrounded by high ground, of which the "Sumate," the highest peak, rises to the height of 9500 feet above the level of the sea, the country around being well wooded with a great variety of *Oaks* and *Pines*. On the eastern declivity of the Real del Monte chain of mountains is the deep ravine of Mestitlan, commonly called "Barranca grande," which from its chalky soil is a favourite haunt for *Cactaceæ*. It is the only habitat of *Cereus senilis* that I am acquainted with in Mexico, the largest plants of which, attaining a height of 24 feet, give the scenery a very singular appearance. On another excursion to the natural bridge called "Puente de Dios" I found *Spiræa parvifolia*, *Quercus petiolaris*, *Lindleya mespiloides*, the latter forming a slender shrub 10 to 12 feet high, and the pretty little *Mammillaria Schiedeana*, which seems quite stationary there, having nowhere else been met with.

On the barren hills of ZIMAPAN, *Pinus Llaveana*, forming a tree 15 feet high, was at this time (November) covered with small green cones, which are two years in coming to maturity; *Berberis gracilis*, with its slender stem and red leaf-stalks, and *Berberis pallida*, have been found at this station, as well as near the hot springs of Atotonilco el grande. In the ravine of Encarnaçion I found another new species of *Garrya*, *G. macrophylla*, which from its large foliage is by far the handsomest kind; but, unfortunately, the few seeds I found did not grow. *Juglans nigra* was found in the same locality. Near the Company's farm of "Guajolote" I found several sorts of *Pines*, among which *P. patula*, from its smooth slender stem and valuable timber, particularly attracted my attention. Near the small village of Apulco I found *Berberis lanceolata* and *Pinus apulcensis*, and along the road *Cupressus thurifera* forms a stately tree 120 feet high. From this latter station the descent was very rapid to a place called "El Banco," probably so named in allusion to the bank or ledge of rock over which one has to pass at the imminent risk of falling into the ravine below, in order to reach the small village of San Cornelio. The descent to this place is very interesting; at every step there is some change, the noble *Tree fern* (*Cyathea mexicana*) makes its appearance there; *Lopezia lineata*, *Alstonia ciliata*, *Lophospermum scandens*, *Cobæa stipularis*, *Gaultheria nitida*, were all in full flower. It was in company with those that I found the noble *Habrothamnus fasciculatus* of *Schlechtendahl*, the seeds of which I was unable to procure; it was a very fine shrub about five feet high. It has since been raised in Belgium, and a fresh specimen in flower, communicated by Mr. VAN HOUTTE; Nurseryman of Ghent, has furnished, with the assistance of one of my dried specimens, the means of preparing a figure of one of the gayest plants of the Mexican Flora. [A most beautiful thing.]

The valley of OAXACA is between 4000 and 5000 feet above the level of the sea. The greater part being under cultivation, I resolved to visit the well-wooded heights to the east, which are visible from the town. A ride of five miles over a well-cultivated country, varied by a few patches of sugar cane and cochineal plantations, brought me to the entrance of the mountains, which are thinly covered with *Oaks* of a dwarfish growth, intermingled with *Arbutus jalapensis* and *oaxacana*. *Cratægus mexicana*, *Alnus mexicana*, *Maurandya antirrhiniflora*, and a species of *Salix* grew along the rivulet. About 500 feet higher, at a hut called the Rancho del Estudiante, *Pinus Teocote* and *Leiophylla* appeared in company with *Cercocarpus Fothergilloides*, and *Tilia mexicana*, the latter forming a lofty tree. In shaded places overhanging the rivulet, *Fuchsia arborescens* was flowering profusely, forming a little tree 12 feet high with a stem five inches in diameter; a shrubby *Buddleia* and *Garrya laurifolia* were also met with. At the "Rancho del ojo de agua," the ascent became more steep, the *Oaks* appearing in larger masses and taller trees, and covered with several species of *Tillandsia* and a few *Orchidaceæ*.

Having reached the "CUMBRE" or highest point, there were some stragglers of *Pinus Russelliana* or *Devoniana* which in want of cones I could not distinguish, and some stately trees of *Abies religiosa*. The *Oaks* were no longer clothed with *Tillandsias* and *Orchidaceæ*, but their places were occupied by a brown moss hanging gracefully down the branches in threads nearly three feet long, which gives the trees a singular appearance. *Cornus disciflora*, *Ceanothus azureus*, *Rubus trilobus* with its large white flowers, the pretty little *Cuphea pubiflora* and *Melampodium montanum* were found at that station, the elevation of which above the level of the sea, must at least be 8500 feet. In descending gradually towards "La Parada" which is a kind of inn, the woods consist chiefly of *Pinus Teocote* and *Oaks*. On the latter I found *Odontoglossum nebulosum*, *Cattleya citrina*, and several other species. After passing the bridge, "Puente de Gia," where I found *Echeveria acutifolia*, and the village of San Juan, the *Oaks* ceased entirely, and were replaced by small *Acacias* and *Bromeliaceæ*. *Orchidaceæ*, although few in number, no longer cling to trees, but seek their nourishment from the ground; an instance of which is *Epidendrum fuleatum* with its thick leaves and brittle rhizoma, which was growing most luxuriantly on a heap of loose stones, and perfuming the air towards evening with its large white flowers. After descending from the village of San Juan to the Hacienda of Santa Ana, and following the rivulet as far as the mine of Socorro, I crossed a high ridge, where mining operations are carried on, and arrived at the Hacienda del Carmen, an establishment for reducing the silver ore. Carmen, or Castresana as it had formerly been called, is situate in a deep and narrow ravine, the sides of which are well wooded with *Pines* and *Oaks*, the showy *Arctostaphylos nitida*, *Gaultheria hirtiflora*, *Vaccinium brachystachyum*, *Arbutus jalapensis*, *Lyonia ferruginea* and *Philadelphus mexicanus*. Ascending the steep sides on the right I arrived on the "Monte Pelado" or bald mountain, so called from the upper part being destitute of trees, which gives it a singular appearance compared with the mountain ranges on the opposite side of the ravine. Near "Las Cruces" on the ascent to the Monte Pelado I observed some remarkably fine trees of the *Abies religiosa* and *Pinus Ayacahuite*, the latter measuring three to four feet in diameter. Bordering on the limits of trees I found three plants, remarkable for their geographical distribution; they had previously been known from other countries; they are *Chimaphila maculata*, *Pyrola rotundifolia* and *Ottoa œnanthoides*, the latter found by Humboldt near Ibarra in the Andes of Quito.

Having well examined the vegetation about Carmen, I ascended the high ground at the back, crossed LLANO VERDE and arrived at the Indian village of Tanetze. The name of Llano verde (green plain) is given to the mountain intervening as far as Tanetze, a distance of eighteen miles, and is derived from a green swampy place in the midst of the wood, measuring some twenty feet square. The climate of Llano verde is termed by the natives "caliente humida," or warm and damp, the temperature being about 70° Fahr. and particularly adapted to the growth of *Oncidium ornithorhynchum*, which I found there in great splendour. In the more elevated parts *Pinus apulcensis*, *Tilia mexicana*, *Clethra mexicana*, several *Lycopodiums*, *Pteris aquilina* twelve feet high, and *Cyathea mexicana* were met with. Descending this ridge, several *Melastomaceæ*, *Epidendrum rhizophorum* with its bright scarlet flowers, were growing on the outskirts of the wood. From Tanetze I went over a broken road to Tabaa, where I found *Befaria laevis* and *discolor* in full flower, growing in company with *Magnolia glauca*, the flowers of which are used by the religious Indians in decorating their places of worship. Tabaa, being situate in "tierra caliente," or the warm country, produces some fine *Pine apples*, *Oranges*, *Plantains*, *Sugar-cane*, *Cherimoyers*, and *Coffee*. Descending towards Santa Gertrudes I found a small bean, the seeds of which resemble those of *Abrus precatorius*, and are said to be employed with success against the bite of the little venomous spider called Chiatatlahua.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

THE time for potting plants has now arrived, and the greatest care is necessary in the selection of proper composts for different families. Good friable loam, fibrous turfy peat, leaf-mould, and sand are the proper materials from which composts for all kinds of plants may easily be made; one-third peat, one-third leaf-mould, and the other third of loam and sand, will make a suitable compost for young plants of nine-tenths of those in cultivation. Older plants will require the proportion of peat lessened, and that of the loam increased; sandy peat alone is used for Heaths, Epacrises, and such like; but the more robust of these and all the Chinese Azaleas, ought to have one-third leaf-mould added to their compost. Two-thirds loam, and one-third leaf-mould, charcoal, and sand, is a good compost for Orange-trees, Neriums, and many other strong woody plants; charcoal and ground bones make the best of drainage for all plants, and a greater quantity of them may be used in that way than of pot-sherds; thus making the drainage more efficient, and yielding a great store of nutriment for the more active roots. The day temperature may now be up to 80° with sun heat, but not above 60° at night. The paths should be sprinkled over occasionally on fine days, and the atmosphere of all the houses should be kept more moist for the future.

Conservatory.—Old-established specimens in this house need not be potted for the next six weeks. Old plants in general, do not require to be so early potted as the young portion of the collection. The varieties of the Chinese Primrose are very useful from September to May, on account of their flowering so early in the autumn; a small quantity of their seeds may now be sown, and three more sowings of them, made in April, May, and June, will carry on the succession. Mr. Latter, the great Cucumber grower, is also an excellent grower of these winter flowers; he uses leaf-mould only, in which they grow and flower better than in any compost; cuttings made now from forced Anne Boleyn Pinks, will be ready to be planted out by the end of April and May; as will also cuttings of other Pinks and Picotees now in forcing. Be careful of Bulbs. When they have done flowering, the best plan is to turn them out of the pots and plant them in a cold frame in any light soil: afterwards they come in useful for spring flowers in the borders. Sitting-rooms are destructive to most plants; endeavour to change the plants in them as often as convenient, and keep up a large stock of those most preferred for this purpose.

Greenhouse.—Go on potting the younger portion of these plants, and see that such as are growing too fast are removed to a cool situation.

Forcing-Pits.—Gardenias and young Orange-trees, forced for their blossoms, will now require a strong moist heat of 75°, with a bottom-heat from 80° to 90°. Many of our common border-plants will force from this time, if taken up with balls, potted carefully, and kept in the shade the first week. Common Auriculas and Polyanthuses will answer well in this way; leaf-mould is the best material for them under this treatment. The Evergreen Berberises are good plants for forcing, and they are much sweeter when they are forced. Daphnes do not like leaf-mould so well as poor sandy loam, in which they will force easily; all the herbaceous Pæonies will force in pure sand, or any refuse soil from the potting-bench, and they require no preparation beforehand. Seed-pots should never be exposed to the sun till all the plants are up; many seeds that are difficult to vegetate will come up easily in perfect darkness, but all should receive some bottom-heat.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

In the Flower-garden many of the spring Bulbs will now be showing bloom; it will therefore be necessary, on a dry day, to hoe the beds over, so as to freshen them up, and make them a little neat. After the late frost the lawn should be raked over with the daisy-rake, to clear the grass of worm-casts or stones, and be rolled with a heavy roller at least once a week. Where the grass is coarse it is a good plan to have it mown, cutting it close to the ground at this season, and where the herbage is thin or does not "cut well," all the Dutch Clover-seed should be sown and afterwards thinly covered with some rich soil. To those parts of the lawn which soon burn up in dry weather, apply a dressing of wood-ashes and soot with a little sand, or if more convenient, give a good soaking of liquid manure. Relay or repair Box edgings and Grass verges, so as to have everything ready for trimming the walks, as soon as the weather is favourable.

Rosery.—Most of the hardy Roses being now pruned, the beds may receive their spring dressing. Night-soil is said by Mr. Rivers to be the best manure to use, and if disinfected it is not objectionable, but if not disinfected it will be better to trust to the drainings of the dung-hill, or to a dressing of Potter's Guano, superphosphate of lime, or Lance's Carbonated Humus. Plants that were much infested with green-fly last season, may be cleared of the eggs of that or any other insect, by syringing them with water, at the temperature of 160°, or by painting them over with lime, soot, and cow-dung, mixed to the consistency of thick paint with strong soap-suds. This is a certain remedy.

Pits and Frames.—The plants here, which hitherto have been kept quite dry, may now receive a gentle watering on some sunny morning, and be encouraged to grow a little; give plenty of air in the daytime, but cover securely at night. Proceed with the potting of autumn stock plants, and the pricking out of tender annuals, which should always be attended to before they become crowded in the seed-pots, and encourage the plants afterwards in a close gentle heat until they are established in the new soil. Pot Tigridia pavonia and conchiflora in light turfy soil, putting two bulbs into a 48 sized pot, and placing them in a warm frame or forcing house until they begin to grow. Make a sowing in heat of Œnothera macrocarpa and taraxacifolia, two exceedingly useful plants, which flower beautifully in the autumn, if sown at this season. Stop scarlet and other Pelargoniums intended for planting out, so as to make them bushy.—*W. P. A.*

III.—FLORISTS' FLOWERS.

But little progress has been made during the past week in the Florist's department, owing to the extreme variableness of the weather, the very fickleness of which requires renewed vigilance on the amateur's part.

Florists who have not laid in a sufficiency of plants in the autumn are now thinking of purchasing. The following Auriculas are good sorts for competition, and ought to be in every collection. Green-edge:—Page's Champion, Pearson's Badajoz, and Col. Taylor. Gray-edge:—Waterhouse's Conqueror of Europe, Ringleader, and Lovely Anne. White-edge:—Taylor's Glory, Lord of Hallamshire, and Ashworth's Premier. Selfs:—Dixon's Apollo, Barker's Nonsuch, and Metropolitan. All air must be given when possible, but not if the winds are cold; then tilt the lights.

Polyanthuses ought to be procured without delay. The following may be relied on as good show flowers:—Pearson's Alexander, Buck's George the Fourth, Bullock's Lancer, Hufton's Earl Grey, Lord Ranelagh, and Crowshaw's Invincible.

Ranunculuses.—The seed must be kept moderately moist, by dipping a brush in tepid water and, drawing the hand over it, cause the drops to fall lightly, so that the soil covering it may not be displaced.

Carnations.—Make ready for potting, get the compost under cover the first fine dry day, it being very injurious to the layers to pot them in soil that is too wet.

Pinks.—Try to grow some of these in large pots, mixing a little rough charcoal with the soil; they will well repay the trouble.

Pansies.—Pinch off the leading shoot, to make your plants "stocky;" it will prevent the mortification of having them broke over, at the surface of the bed. Top dress with rotten manure. Potter's Guano has been used with success, "but be careful, do not poison your plants with too much of a good thing."—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—There is much difference of opinion about planting out Pines, and those who would like to convince themselves of the best mode of culture would do well to plant out now, at one end of a pit (heated below by tanks) a few good plants of the Queen and Montserrat, and afterwards to compare the growth of the plants, size and quality of the fruit so treated, with the growth and produce of plants grown in pots in the same pit. I name the Queen and Montserrat for this experiment, as they fruit sooner than many others. The recently potted Pines will require no water for the first few days after potting, unless the soil was dry when used, in which case give a gentle watering. If the watering has to be done from the outside of the pit, choose mild weather for it. Continue to shade during sunshine the plants that were disrooted, using thin bunting or woollen netting.

Vinery.—Vines having their roots inside the house, if the border is the least dry, will require watering: do not be guided by the appearance of the soil on the surface, but examine it nine inches or a foot deep. Add fresh litter to the covering outside, to keep the heat regular. Increase the temperature of the second house to 55° at night, gradually rising, when the buds have all broke and the "shows" have begun to appear.

Peach-house.—Continue the temperature, where the early Peaches are swelling, at 55° or 57° by night during cold nights; they will bear 60° by night during mild weather. Tie in the young shoots nearly parallel with those they proceed from. much of the beauty of a fan-trained Peach-tree depends on the early and careful performance of this. Increase the temperature of the second house gradually to 55° by the time the fruit is fully set.

Cherry-house.—Do not increase the temperature till the fruit begins to ripen, when a few degrees more heat may be maintained. Be careful to use clean soft water in syringing, that the fruit may be perfectly clean when ripe. Attend to watering and keeping the trees free from insects.

Melons.—Much attention will be required to keep the heat in the frames regular; owing to the nature of the heating material, the temperature will vary with the changes of the weather; aim at having 70° of heat by night. Cover with double mats when mild, and keep up the heat during cold or stormy weather by additional covering on the glass and lining. Prevent cold gusts of wind from entering when air is given, by placing slips of bunting or woollen netting over the open space. Stop the plants in frames above the second leaf.—*G. F.*

State of the Weather at Chiswick during the last 13 years, for the ensuing Week ending March 9, 1844.

Feb. 23. Clear, with sharp frost; lightly and uniformly overcast; boisterous, with heavy rain in the evening.
24. Clear and fine; cloudy; clear and frosty; rain.
25. Rain: squally, with showers; slightly clouded and fine.
26. Heavy clouds and showers; barometer exceedingly low: sunshine and showers alternately; hail-shower half past 1; boisterous with rain.
27. Clear and frosty, with very slight sprinkling of snow and hail on ground; clear, cold, and dry.
28. Clear and cold; fine, with sunshine; cloudy and fine.
29. Slight frost; clear and very fine; rain at night.
Mean temperature of the week, 0.3 deg. above the average.

Notices to Correspondents.

GARDENERS' CHRONICLE.—The first Number of the present year has been reprinted, and may now be had. The newspaper part has been omitted.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*W.R., J.C.X., E. Bevan, M.D., A. Pettigrew, P. P., W. Billington, M. G., J. B. K. L., J. Wighton, E. J., A Visitor, J. L. Snow, W. B. Booth, A Subscriber, J. Brown, G. Thompson, Vitis, A Practical Man, Peter Mackenzie, Quercus, R. Errington, Gr., J. M'I., J. Spencer.*

APONOGETON DISTACHYON.—*Alpha.*—I have grown this plant for several years in a small pond at Stoke Newington, and have had flowers sometimes within a week of ice being on the surface of the water. It is necessary to plant it below the influence of frost, but not deeper, as, if too deeply planted, it will not be able to reach the surface, on which its long leaves float. It blooms freely here all the winter months in a shallow tank in the greenhouse, where, on account of its fragrance, it is a great favourite. It seeds freely, and every season produces a numerous progeny of self-sown plants.——*J. B.*—It grew and flowered freely from February till June, in an aquarium formed in a sluggish brook, with a calcareous mud-bottom, from about 1834 to 1840 (when the informant quitted the premises) at Stoke Bishop, in Gloucestershire, and since that, in a pond made with plastic clay, with the superior lining of chalky loam, at Ashby, in Hampshire, till devoured by sheep.—*Anon.*

ARNOT'S STOVE, imitated in fire-brick, is set up in a small greenhouse; the fire is regulated by a valve of easy control, and will burn 12 or 14 hours without attention. The only defect in the stove, is the difficulty of finding a cement that will stay in those joints of the brickwork nearest in contact with the fire: these open joints invite a capricious admission of air, destroying the control of the valve, hindering the continuance of the fire, and influencing the degree of heat. Perhaps some of our kind readers can suggest a cement that will help the dilemma of a subscriber.—*P.*

ASPARAGUS.—*A Subscriber.*—We do not know whether the Biscay mode of growing this has been exactly followed, no report on the subject having reached us. But we do know that the application of very strong manure, in the manner described by Captain Churchill, has been very advantageous. Common Guano, mixed with sea-salt, and applied in a liquid form, has proved most beneficial.

ASPHALTE.—*Nhoi.*—We do not think sea-sand can be employed in making asphalte floorings and paths, because there is no getting it dry, and perfect dryness is indispensable to the success of the operation. One inch thick is not enough. We do not see why lime rubbish should be injurious; we know it, on the contrary, to be advantageous. You may apply gas-water to your Peach-trees safely now.

BOOKS.—*William.*—We agree with you that gardening books are often too dear. Booksellers will allow gardeners some discount for gardening books, if they apply to the publishers of them. We, however, cannot interfere in such matters.——*A Subscriber.*—Your question is quite out of our line. You had better consult the foreman of the nearest brewery.

BRACHYCOME IBERIDIFOLIA.—*Clericus.*—Seeds of this should be sown in pots or shallow pans filled with light rich soil, and well drained. The pots should be plunged in a gentle hotbed. In order to obtain blooming plants early, the seeds may be sown now; but if that is not an object, a fortnight or three weeks hence will be better; as soon as the young plants are up they should be potted into small pots, and if they are to be kept in a greenhouse, shifted into larger ones as they require it. Those that are to be grown out of doors should be planted out in a prepared bed early, say by the end of May, in order that they may perfect their seeds in September or early in October.‡

BEES.—*J. W. K.*—Would be obliged for information as to the success that has attended the use of Bagster's hives.

CARNATIONS AND PICOTEES.—*A Reader of the Chronicle.*—Neither the aspect nor the opaque roof will suit Carnations and Picotees; they require plenty of light when coming into bloom. We recommend you the following sorts:—*Scarlet Bizarres:* Twitchett's Don John, Martin's Splendid, Headley's Wm. Cobbett, Rainsforth's Gameboy, Roi de Capucin, Ely's Lord Durham. *Crimson Bizarres:* Puxley's Prince Albert, Holmes' Count Paulini, Cartwright's Rainbow, Ely's Duke of Bedford, Strong's Linnæus, Ely's Lord Milton. *Purple Flakes:* Mansley's Beauty of Woodhouse, Millwood's Premier, Nix's Lady Chetwynde, Strong's Esther, Lascelles' Queen of Sheba, Hogg's Colonel of the Blues. *Scarlet Flakes:* Chadwick's Brilliant, Maud's Rowton, Wigg's Earl of Leicester, Simpson's Marquess of Granby, Willmer's Hero of Middlesex, Greasly's Mary Anne. *Rose Flakes:* Brooks' Flora's Garland, Wilson's Harriet, Ely's Lady Ely, Willmer's Endymion, Fletcher's Duchess of Devonshire, Sidemone's Lady Rowley.*

CELERIAC.—*P. T. O.*—Should be raised like Celery, and similarly managed, till fit for planting out. It should always be divested of side slips. It requires rich sandy soil, in which it may be planted out, shallow, in the beginning of June, the plants being 15 inches apart. It must not be earthed up. ‖

CUCUMBERS.—*A Subscriber.*—A thermometer plunged into the mould of the bed, about three inches deep, should indicate 80° of heat, which is a safe temperature for the plants. ‡

DATURA, &c.—*An Irishman.*—Presuming that your Datura is D. arborea or sanguinea, it requires the following treatment:—Being large plants, growing to the height of 10 or 12 feet, they flourish best when they are planted in the bed of a conservatory; but they will also grow well in large pots. The soil should be a mixture of peat, loam, and sand, with a little leaf-mould. They do not succeed well when planted in leaf-mould alone, which is, no doubt, the cause of your plant becoming sickly. Brachysema latifolium is an abundant bloomer, and grows freely in peat, loam, and sand, with the addition of a little rotten dung. The same kind of soil will also suit Hovea Celsi, which should be kept in a light and airy part of the greenhouse, and potted and watered with care. To render it bushy, the main shoot should be topped when the plant is young, and the young laterals should also be shortened in when they begin to grow, for if this is not attended to the plant is particularly liable to grow up tall and naked at bottom.‡

FINOCCHIO.—*P. T. O.*—A dwarf variety of Fennel. It will grow in any rich light soil. Sow in drills, and blanch the young shoots by earthing up. It will not do *well* without bottom-heat ‖

FRUIT-TREES.—*Abdulonymus.*—Your Apples and Pears are for the most part subject to canker. They are old varieties. Your soil has doubtless its share in causing the disease; but you had better get new kinds. If you cannot procure fresh rich loamy soil, the *sward of any soil* will certainly prove beneficial. We would still advise you to cut away all unsound wood. Lime will be best applied, in a quick state, early in spring. It should be spread over the surface of the ground, and dug or forked in so as not to injure the roots.‖

GOLD-FISH.—*C.*—The Gold-fish is a species of carp, and all these fish deposit their spawn on weeds growing on the shallow sides of ponds most exposed to the influence of the sun. The common-pond weed, the Water Ranunculus, and the coarse Grasses which float on or near the surface, are the most favourable for this purpose. An artificial pond, 30 feet diameter, of an inverted conical form, 3½ feet deep in the centre, and composed of stone and mortar, is most probably too deep at the sides for the spawn to be hatched, even if the weeds above mentioned are in the pond. If the sides are shallow the common Forget-me-not would afford the proper means for the fish to deposit its spawn on the stems; and other plants that are ornamental may be found to answer the purpose; but without a shallow side it is likely that the spawn, by not receiving sufficient warmth, would perish. Fish are male and female. The female deposits the ova or hard roe, and the male then deposits the milt or soft roe on the ova, without which latter process no vitality ensues. Water-lizards might eat some of the spawn, but unless they were in great abundance it is not likely they could destroy the very large quantities of spawn which the female fish in a healthy state usually deposits. *B.* [There is a book by Boccius "On Fresh-water Fish;" and Mr. Yarrell's "British Fishes" is a classical work.]

GRASSES.—*Paris.*—For the purpose of distinguishing Grasses take "Parnell's Grasses of Scotland;" for their qualities, "Sinclair's Hortus Gramineus Woburnensis;" for systematic questions, "Kunth's Enumeratio." They are all cheap books.

GREENHOUSES.—*A. B.*—Nothing will grow in an old-fashioned hibernatory with an opaque roof and high front sashes; but many things will live in it through winter without growing. For growth, light in abundance is requisite. If you take off the roof and replace it with glass, then Camellias and Oranges may succeed in it in the open ground.

HEATING.—*Hants.*—We find earthenware pipes break at the joints, and we understand that this always happens; but we are told that if the flaws are made good with cement, they will do very well afterwards. You had better use hot-water gutters, constructed as recommended at p. 660, 1843, and covered with slate.——*H. D.*—No doubt gas had distilled from the coals during the night and had exploded. This is *one* of the nuisances attending smoke flues. We would rather not have a greenhouse at all than heat it by smoke flues.——*Clericus* will probably find his purpose answered by a plan of a Melon-pit that will be published next week. Cut down your Vines to three eyes, and enrich with bones and good stable-dung; it is immaterial whether they are started in heat or not. Mr. Roberts's directions are very good, and it is a great pity you cannot cover your border with stable-litter. Perhaps you can keep off the cold rain of spring by boards or some kind of contrivance. You can force vegetables and Strawberries in your pit; but it will not suit Greenhouse-plants where the Vines cover the glass.——*J. H.*—When you are afraid of expense it is difficult to do what you want. The best way for you to proceed would be to get a set of Eurbidge and Healy's iron tanks; but if they are too dear, then you must have recourse to hot-water brick-gutters, which will not be too damp if covered with slate. For the greenhouse end you had better trust to the flue of the fire-place which heats the tanks. We quite agree with you that all the boilers yet manufactured are far too expensive for many little operations. Can't you get an iron saucepan set in brickwork and pierced for a flue and return-pipe? It would do very well.

HYACINTHS.—*Anon.*—We cannot explain your case, which, in the way you state it, is unaccountable.

INSCRIPTIONS.—*A. O. M.*—We know of no application likely to clear away from the surface of a very old rough-hewn limestone slab the incrustation of Lichen, &c., now rendering illegible a supposed inscription, except the strongest possible solution of caustic potash; and we are not sure that it would succeed. It is, however, worth trying.

INSECTS.—*Eileannach.*—As there are many caterpillars which attack fruit-trees when they break into leaf, we cannot tell what species it is that you suffer from, but if you will send us specimens when the larvæ make their appearance we will give you the best information in our power. It may be the caterpillar of the winter-moth, Phalæna (Hybernia) brumata, whose history you will find in vol. i, p. 812, with figures, and the best mode of arresting that pest. *R.*——*A Young Gardener.*—The curious rings of eggs from the branches of fruit-trees will produce the caterpillars of the "Lackey-moth," which spin a web, and are very injurious in orchards and hedges, where they abound to a great extent. See vol. iii., p. 244, under the name of Bombyx Neustria. *R*——*A Constant Reader.*—Train-oil is an excellent application for your Apple-trees. See last week's *Chronicle*, p. 116. *R.*——The beetles communicated by *Professor Royle* feeding upon Cayenne pepper, are a species of Anobium called Leioderma testacea, which inhabits South America as well as the East Indies. The application of heat, either by baking or immersion in boiling-water, would destroy the insects; and if the bottles be made of cast glass, this process will be attended without loss. The East Indian Wheat has been eaten by a Weevil named Calandra oryzæ, from its depredations on the Rice. It is closely allied to C. granaria; see vol. iii., p. 907. *R.*

LAWNS.—*A Novice.*—On 1½ acre of new lawn you may sow the following grass-seeds, viz, Festuca duriuscula, 4½ lbs.; F. tenuifolia, 3 lbs.; Cynosurus cristatus, 7½ lbs.; Avena flavescens, 1½ lbs.; Lolium perenne, 30 lbs.; Poa nemoralis, 3 lbs.; P. sempervirens, 2 lbs.; P. trivialis, 2½ lbs.; Trifolium repens, 11 lbs.; and T. minus, 3 lbs. This is a sufficient quantity to cover the ground closely in a short time.‡

LARKSPURS.—*A Subscriber.*—These will succeed in almost any soil; but a rich friable loam and a situation open to the sun suit them best. They are improved by adding thoroughly rotten manure freely to the soil in which they grow. The seeds of the annual kind do best to be sown in autumn, as when they are sown in spring it is late in the season before they flower. It is probable that your young plants of these are eaten off by slugs, with which you say your soil swarms. These may be effectually destroyed by applying pretty strong gas-water to the ground at their feeding time; but it must be clear of plants.‡

MELONS.—*Theta.*—If you will again refer to the article on the Cultivation of the Melon, on January 27th, you will find it there stated that one plant was planted under each light, from which two shoots were trained up the trellis, and about three Melons were allowed to swell off in the same space; that is to say, that the average number of Melons grown on each plant was three. With regard to your second question, the layer of dung and leaves at the bottom was firmly trodden, but the soil was only pressed with the hand round the sides of the pit, and not trodden; because treading makes it liable to crack when it becomes dry, and the roots are thereby severed from the plant. If your soil is light and dry when it is put into the pit, you may tread it with advantage. There are many little matters necessary to be observed in the cultivation of most plants, upon which it is difficult, without going to a great length, to give directions which shall be applicable under all circumstances. It was the Hoosainee Melon which was grown at Trentham last year. The seeds were obtained from a distinguished cultivator six years since, and were, no doubt, true at the time. Since then, notwithstanding the pains that have been taken to prevent it, it is possible that it may have become impregnated with the Ispahan. If it has become so crossed, it is probably not the less valuable on that account. At all events, I consider that the flavour was as good last year as when I first had it; and there was no other kind grown near it last year. I cannot assist you in obtaining the Sirdar Melon, having only now been able—and that through the kindness of a gentleman in Ireland—to obtain two seeds.—*G. F.*

MANURES.—*W. T.*—We fear sulphate of soda will not prove a good manure. Experiments are not in favour of it. If used at all it had better be mixed with the dunghill at some such rate as two stone to a ton of the dung. Sulphate of ammonia should be applied in March at the rate of 2 or 3 cwt. per acre. Its effects are very powerful but transient.——*R. H. C.*——Give a wine glass of superphosphate of lime to each plant of Pelargonium when prepared for flowering. Potter's Guano is an invaluable manure. Use it as a top-dressing at the rate of 3 lbs. to a rod.——*Monmouth.*—As gas-water varies in strength, no exact quantity of sulphuric acid will fix the ammonia. Add the acid, a little at a time, till effervescence ceases, and then the fixation will be complete. Experiment serves to show that March is the best time to apply gas-water, &c. to grass-land. Applemust has a bad reputation as a manure, and is only fit to be fermented in a dunghill. No means are known of preventing the death of branches of the Moorpark Apricot.——*T. B. C.*—Guano may be applied before the seed is committed to the ground, but it must be mixed with a large quantity of soil or it will kill the seedlings. The best way of applying it is mixed with water, poured between the rows of plants as soon as they are fairly above ground.

MORPHOLOGY.—*K.*—Is it fair to criticise "R.E." before he has stated his case? If his arguments can be refuted, we shall be very happy to insert the refutation, when he has closed the subject; but we confidently expect that so sensible and well-informed a man as you are, will be a convert before then.

NAMES OF FRUIT.—*S. S. S.*—Your Pear is the Virgoulense. ‖

NAMES OF PLANTS.—*Silex.*—Mammillaria tenuis.——*C. D.*—The Trymalium is odoratissimum, and is from Swan River. The Epidendrum is very like ionosmum; but *if* it *really* is from the Organ Mountains it must be new. We cannot, however, take for such a fact the authority which gave you the Cape as the native of the country of the Trymalium. The colour of Centradenia is more or less pink, but the term red is not strictly applicable to it.——*S.*—Erica herbacea.——*C. C.*—1. Some Hedychium. 3. Lotus Jacobæus. Others not in a state for determination.——*J. McI.*—It is impossible to name a plant from a leaf and a sketch, unless it is something well known. Perhaps it is some Cæsalpinia.——*C. H. N.*—1, some Viburnum, perhaps. Fragments out of leaf and flower cannot be named.¶——*W. S.*—1, some Thuja; and 2, some Juniperus, but they cannot be determined from such fragments; the latter resembles J. phœnicea.——*J. S.*—1, Calceolaria pinnata; 2, Pyrus pinnatifida; 3, Cratægus torminalis. The ignorance of natural history of people who write books of travels is disgraceful. Opobalsamum is produced by Protium guadense; Nabbutch is a name we don't remember; Valonidia is Quercus ægilops; the prickly Oaks are——anything.——*A Young Gardener.*—Araucaria imbricata, Gnidia sericea.

PANSIES WITH DISEASED LEAVES.—*C. T.*—You would oblige us by sending more specimens of your Pansy leaves, and say whether the variety from which they are taken is a seedling; and whether the disease is confined to this particular sort, or if others are affected in the same way. What is your compost?*

PICOTEES.—*A Reader of the Chronicle.*—*Red-edged*—Sharp's Duke of Wellington, Brinkler's Masterpiece, Gidden's Teazer, Sharp's Criterion, Wood's Queen Victoria, Brinkler's Duchess. *Purple-edge*—Dickson's Trio to Cambridge, Sharp's Invincible, Gidden's Miss Hennell, Brinklow's Purple Perfection, Ely's Grace Darling, Mrs. Hemningway. *Rose and scarlet-edge*—Kirtland's Squire Annesley, Green's Queen Victoria, Wilson's Miss Fanny Irby, Garratt's Lady Dacre, Beauty of Hemmingford, Sykes's Eliza.*

PITS.—*S.*—We recommend the pit figured in the *Chronicle*, at p. 892, 1843, known by the name of the Heckfield pit, as excellent, when stable manure *must* be used.‡

POLYANTHUSES.—*An Old Subscriber.*—Pearson's Alexander, Buck's George the Fourth, Cox's Prince Regent, Clegg's Lord Crewe, Huston's Lord Rancliffe and Squire Ray, Eckersley's Jolly Dragoon, Nicholson's Gold Lace and Bang Europe, Fletcher's Defiance, Crownshaw's Invincible, and Clegg's Lord John Russell. We do not recommend particular Nurserymen or Florists.*

ROSES.—*R. C. W.*—Your China, Tea-scented, and Bourbon Roses may be pruned when the coverings are removed, cutting well back the strong shoots, and taking out the weak ones entirely; at the same time all dead wood or unsightly stumps should be cut neatly out, leaving the young shoots thin and regular.‡

SEED-SAVING.—*Expansa.*—We hardly understand your question. If seeds are to be saved quite pure, care must be taken to prevent the flowers being hybridised by those of other varieties of the same species: and this is done by setting the flowers artificially or by covering the blossoms with muslin, while expanded, and until the seed-vessels begin to swell. Some seeds, however, are not very prone to hybridise, especially Celery, Endive, Leek, and Carrot; but Beet, and all the Turnip, Radish, and Cabbage races are sure to do so in the absence of precautions. Once transplanting after the plants are full grown is often enough.

STRAWBERRIES.—*C.*—Strong young plants with good balls will fruit this season. Canterbury Bells will not bloom the first year, unless sown very early, nor will plants of Alstrœmeria.‡

THE FASTOLFF RASPBERRY.—*Fair Play* must excuse us. We have already stated, on his authority, what the history of this variety is, and thus due honour is given to those by whom it was raised. We do not find that Messrs. Youell pretend that they raised it themselves. If other people wish to sell it they must advertise it; if not, why complain? We never insert attacks upon individuals, unless for some very grave reason; and here we see no reason at all. To print an anonymous imputation without finding room for a reply, would be anything but fair play, and our columns are intended for something better than disputes.

TOMATOES.—*P. T. O.*—Should be sown in March, in pots, and placed in gentle heat. The plants should be shifted into larger pots, as they require, till the end of May. They may then be planted out in a warm situation, and kept supported from the ground. When a moderate quantity of fruit has formed, the plants should be stopped, and no more fruit allowed to appear, for in this climate only the earliest formed acquire maturity. Regulate frequently in order that the plants may not be deprived of much foliage at any one dressing.‖

WHEAT-SPLITTING.—*Tassel.*—The observations already made upon this subject in our columns have led to some, and we hope to many, such experiments as you propose. It is not worth renewing the subject till the result of those experiments shall be seen.

YEAST.—We have to thank two or three correspondents for communications on this subject, which we shall publish, if they prove useful upon trial.

MISCELLANEOUS.—*A. B. C.*—Seysell asphalte is made by a company. We do not know what its composition is. You may raise Deodars in the same way as Larch, or in many other ways. See our volume for 1842, p. 159. If you have failed it is probable that your seed was bad.——*A. F.*—Your Evergreen Oak will shoot again if cut down; the operation should be performed as soon as the buds are beginning to swell. It is not *very* unusual for Pear buds to bear fruit the first year after insertion; but it usually spoils the bud.——*H. B. J.*—Plant your Arrow-root in light peat and loam, give it *plenty* of pot-room, plunge it in a bottom-heat of 80° or 85°, and keep it damp while growing, so as to drive off red spider.——*Condiscipulus.*—Your distances are proper for Cedars of Lebanon, but too great for Araucarias, which do not spread very much laterally; ten yards are enough for them.——*Flora.*—Commelina cœlestis is the only one of your plants that will flower with any certainty the first season.——*A Gardener.*—Worms may be killed by watering your ground with weak gas-water, or lime-water, or a very weak solution of corrosive sublimate. The kind of Kale known among gardeners by the name of Curled Kale is suitable for a private garden.‡——*W. M.* will find an article on the destruction of rats given in No. 46, 1843. A common way of frightening birds from kitchen garden crops is to set up sticks having Potatoes stuck full of feathers attached to them by means of a piece of twine, in order that they may be moved by the wind.‡——*A Subscriber* is answered in last week's Paper, p. 120.‡——*A Subscriber* should refer to our columns, where the prices of netting are advertised. We never recommend dealers.‡——*&.*—You may plant your Cape bulbs now, and keep them from frost.‡——*A. W. B.*—Thanks. We will attend to it.——*Hereford's* Letter is sent to Mr. Moorman.——*Anon.*—An Ellis's microscope, with knives, &c., complete, may be had for the sum you mention; and it is the most useful we know of. The book you inquire about will not be republished in less than a twelvemonth. "Paxton's Botanical Dictionary" does not contain the names of weeds. To purchase the books you name would be of no advantage to Mrs. Loudon.——*J. H.*—We believe Mr. Hope is correct in his statements respecting Gas Tar; but we have not tried it. Its vapour would probably be deleterious to plants in leaf.——*Omicron's* Letter is sent to the Loudon Committee.——*J. W.*—The wood is impregnated with iron, not copper. The colour is curious. The infiltration seems to have taken place since the wood was separated from the parent tree.——*A., Watford.*—A full Index is always given at the end of each year, as you may see by referring to previous volumes.——*A. P.*—Your Pines are certainly in a woeful state; but it is impossible to say why, without seeing them. It *may* be the iron.——*A Journeyman Gardener.*—Much obliged, but we have no use for the volume.——*M. D. T.*—Pray send your address.

SEEDLING FLORISTS' FLOWERS.

CAMELLIA.—*J. K.*—Your seedling is a promising flower; but having bloomed it under such disadvantages, the probability is that the defects in it may arise from that circumstance, and the flower may be much improved another season, under better treatment. It is of a good size, pleasing colour, the petals well formed, and of good substance, with the centre well filled up; this part of the flower, however, is the defective part, from the petals being so much crumpled and imperfectly marked. If better cultivation will not remove this defect, it will be of little use.*

CINERARIA.—*M. G.*—As far as we are able to judge from the remains of a single bloom, much mutilated, your seedling promises well; the white is pure, the flower large, and of good substance.*

*** As usual, many communications have been received too late.

ERRATUM.—In last week's Paper, p. 116, col. *b*, line 17 from the bottom, for "crevices in the back," read "crevices in the bark."

EXAMPLE FARM.

WANTED, to Rent on Lease, for a term of not less than 21 Years, to enter at Lady-day, a Commodious Dwelling-house, and about 120 acres of Arable Land, for the purpose of forming it into an EXAMPLE FARM. It must be near to a Railway station, and within 50 miles of London; on the greensand formation, under the chalk, or on the London clay or plastic clay above the chalk.—Apply to Mr. MORTON, Chesterhill, Stroud.

FARMS TO BE LET IN THE ISLE OF WIGHT:—

FORELANDS, at BEMBRIDGE, in the Parish of BRADING; Containing:—

Arable	220a.	1r.	33p.			
Meadow and Pasture	26	1	15	a.	r.	p.
Homestead, &c.	2	0	15—218	3		23

TAPNEL FARM, in the Parish of THORLEY; Containing:—

Arable	344	1	39			
Meadow and Pasture	73	1	28			
Down	50	0	29			
Homestead	4	0	8—472	0		24

CHESSELL, in the Parish of SHALFLEET; Containing:—

Arable	267	1	6			
Meadow	6	2	39			
Pasture	10	0	4			
Down	70	2	23			
Homestead	2	2	22—357	1		14

BARTON FARM, in the Parish of WHIPPINGHAM; Containing:—

Arable	350	0	13			
Meadow and Pasture	71	2	33			
Homestead	7	2	14—429	1		14

For Particulars and to treat for Lease apply to Messrs. H. and R. B. SAWELL, Newport, Isle of Wight.—Feb. 24, 1844.

The Agricultural Gazette.

SATURDAY, MARCH 2, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Mar. 6 . { Agricultural Society of England. / Highland and Agric. Society.
THURSDAY, Mar. 7 . Agric. Imp. Society of Ireland.
WEDNESDAY, Mar. 13 . Agricultural Society of England.
THURSDAY, Mar. 14 . Agric. Imp. Society of Ireland.

FARMERS' CLUBS.

March 4 { Wickham Market. / Yoxford. / Wenlock. / West Hereford.
March 5 { Framlingham. / Collingham. / Rayleigh.
March 6 Harleston.

WE all know that correct Agriculture presents to our view a series of the most beautiful illustrations of natural laws, and an amateur of the art may well be carried away by enthusiasm while observing how the facts which come under his eye in the field tally with his scientific knowledge previously acquired in the closet; and he may well be excused instead of being ridiculed for the losses which this enthusiasm, when unbridled, entails upon him. But we must endeavour always to keep in mind that Agriculture is a business by which men earn a livelihood; that it ought to be considered only in the matter-of-fact light of a means of investing capital and labour; that *that* only is an improvement in it which increases the profits of this investment. Now, the means of thus improving Agriculture are two-fold, viz., those arising from the existence of defects in modes of producing, whether the produce be vegetable or animal; and those dependent on the state of the market for articles of produce; and these last are often made use of, as, for instance, when a farmer resolves, after a consideration of market prices, to change his rotation of crops, substituting one crop for another, or commencing the cultivation of, to him, an entirely new plant. It is to an instance of the latter kind that we intend at present to refer.

Several of our correspondents have asked from us an account of the CULTURE OF FLAX. This plant is cultivated to a considerable extent in this country; to an extent which, owing to the disinterested labours of Mr. Warnes, of Trimingham, Norfolk, and to the labours of a Flax Improvement Society at Belfast, is rapidly increasing. It is chiefly confined to the alluvial districts of England and the rich loamy land of North Ireland, these being the descriptions of soils preferred by the plant. To show the rapidity with which the cultivation of this plant is increasing, we may mention that at the third Annual Meeting of the Society referred to above, Mr. S. R. Mulholland said that "the firm with which he was connected had, on an average of previous years, sent no less a sum than 40,000*l.* annually of ready cash out of the country, for the purchase of Flax; but this year they had not expended abroad as many pence." And to show what extent of land in Ireland bore Flax last year, we may mention that it is estimated that 37,817 hogsheads of Flax-seed of 7 bushels each, were sown last spring in that country, and each hogshead containing seed enough for three acres, we find that 112,000 acres was the extent sown. This would probably yield on an average 6 cwt. per acre, or in all 36,465 tons of scutched Flax, which at 45*l.* per ton amounts in value to 1,640,925*l.* These figures are taken from the published report of the Flax Society of Belfast, a pamphlet * which besides containing much valuable statistical information on Flax-culture, is full of useful practical details. We find in the Appendix to this pamphlet that 55,113 tons of Flax were imported, chiefly from Russia, in 1842, and notwithstanding the increased produce of the article at home, it thus appears that there is still ample market for the article, and every prospect of its continuance.

* Proceedings of the third General Annual Meeting for the promotion and improvement of the growth of Flax in Ireland, &c. Belfast, F. D. Finlay, Calendar-st. pp. 74.

The Flax-plant, as we have said, grows best on loamy clays; the soil on our alluvial deposits may be considered as a correct representative of them. It is cultivated in various ways. In many districts it is grown after Wheat; in others, Potatoes and other roots are the preparatory crop; and in Scotland, it is frequently grown after Oats which have been sown on lea. As we may safely follow the example of the Netherland farmers in allowing the plant to seed, for Belgian Flax obtains the highest price in the market, we must consider Flax as a seed-producing crop, and practical men join in calling it a most scourging one; and, therefore, its place in the rotation should be after a green crop—a manure-producing crop. The best crop to precede it is Grass.

The land should be ploughed before winter, so as to let the furrow-slice be well reduced by the frost, and when harrowed down as fine as possible it is ready in the early part of April to receive the seed. The thicker this is sown, the finer will be the fibre of the flax, but the less will be its quantity, as well as that of its seed. About 2½ bushels is generally considered enough; it is sown broadcast, and harrowed in. That which is procured from Holland is considered to be the best, but Mr. Babington informs us that the only seed free from the seeds of a most destructive weed, the Flax Dodder, is obtained from America (see page 89).

Flax must be carefully weeded when young; this, however, ought not to be a work of much labour, as the land ought to be thoroughly clean upon which it has been sown. "The period of pulling the plant is determined by the principal object in cultivating it: when it is wished to procure the fibre, the plant should be pulled somewhat green; when it is wished to procure the seed, either for sowing again or for crushing for oil, the plant must remain till the seeds are ripe. This will be denoted by the hardened state of the seed-vessels, the yellow colour of the stems, and the falling off of the leaves. When Flax of good quality, but not extreme fineness is wanted, the best period of pulling is just when the plant has attained its maturity, with respect to the formation, but not to the full ripening of the seeds. When it is required for the finest fabrics of all, as for cambrics and muslins, it should be pulled when it begins to flower."

As we have already said, it is the interest of the farmer to save the seed of the Flax, and therefore it should not be pulled till the seed-vessels have become brown. It is not necessary *now* to detail the subsequent management of the Flax crop; those who wish further particulars will find them in Professor Low's work on Agriculture, from which the above extract is taken, and in Martin Doyle's "Practical Husbandry."

We are far from recommending that the growth of Flax be inconsiderately commenced on an extensive scale; but it is not necessary to adopt the high figures, such as those of our correspondent Mr. Dickson, which are true only of rare cases—it is not necessary to adopt such figures as true on an average, in order to see that the cultivation of the Flax-plant may be profitably entered upon on suitable soils.

WHEN speaking some time since of the probable—and, indeed, in reference to the few experiments that have hitherto been made, the actual—influence exerted upon the future history of the plant, by the process of steeping the seed in certain solutions, we might have enlarged upon one point which was passed over hurriedly. It was stated that the effect of such a process would probably show itself in the rapid growth of the plant through the period of its germination, and the earlier stages of its growth, during which it is peculiarly liable to injury. It was also intimated that steeping the seeds of plants might have a direct influence upon their growth up to a period considerably beyond that of germination. Now whatever direct influence it may thus possess, it is evident that if it have any influence at all on the condition of the plant during its early stages, it must indirectly exert great influence much beyond those stages. And here we may leave the individual case, and consider for a while the importance of the general principle—

THE IMPORTANCE TO A PLANT OF A VIGOROUS HABIT OF GROWTH WHEN VERY YOUNG.

We do not now allude to plants cultivated merely for their roots and leaves—these differ from those cultivated for their seed in a very important point. Let us take the Wheat-plant and the Turnip respectively as representatives of these two classes. In the latter case, the efforts of the farmer are all bent upon obtaining size of bulb: this is the one point which is the object of cultivation; and, however backward the plant may be at an early stage of growth, genial weather and good cultivation may start it again, and quite remedy previous bad fortune: its size will increase under such influence; its growth is from the beginning to the end a mere process of accumulation—a mere work of addition. In the case of Wheat, however, there are several parts to be looked to. It is the seed which is here important; and the farmer aims not only at obtaining size but number also. This number depends on two circumstances—the tillering of the plant, which increases the number of ears from each root, and the size of these ears—the number of seeds on each. The former of these particulars, equally with the latter, renders it of great importance that plants should be placed in such circumstances when young as will enable them to grow vigorously; but it is to the latter point especially that we wish to direct attention. We have pulled a Wheat-plant early in April, when barely six inches high, and on dissecting it have laid bare the embryo ear, then hardly the tenth of an inch long, and by the help of a microscope we have counted the buds upon it, at this early period—the buds from which the flowers and the seed are to spring. Now this embryo ear in the month of April appeared to possess about the same number of parts, each in an embryo state, as the average of perfect ears; and though we do not know that the ear of Corn is formed in embryo perfect, so far as *the number* of its parts is concerned, from the first, yet it is extremely unlikely that in this case any addition would have been made to the number of those parts, for that was already as great as is usually observed. How important, then, that during the very early period, when this number admits of increase, the young plant should be in a vigorous condition! No future exertions, seconded though they may be by genial weather, will here remedy a fault occasioned by inattention during the first stages of the plant's growth. It is *then*, that the limits are assigned to *number*, and any future vigour on the part of the plant must expend itself in the production of size, and in the full filling up of all the parts which have been formed in an embryo state. This latter point is doubtless of great importance; and the farmer, by all means in his power—the right preparation of the land and due thinness of sowing—must endeavour to push the plant on so as to induce the fertility of all the buds on the ear, which is, be it remembered, of rare occurrence; but let him, by careful attention to these same means, endeavour in the first place to obtain length of ear, such a number of buds on each, as, if all brought to perfection by a good season, may result in a large crop.

ON THE FARMER'S CAPITAL.

WE believe that error is often committed in estimating the capital required on entering a farm; various estimates have been made, but all of them have disappointed the farmer. This remark is suggested by the notice in your *Agricultural Gazette* of the 6th ult., that Professor Low says, "Let no man venture on a farm without having a sufficient capital to work it, which from long experience I compute to be about 6*l.* per acre."

Before we can enter into an estimate of the capital required, we must not only know the kind of farm in question, whether it be a dairy farm, a grazing farm, a stock (hill) farm, or an arable farm; we must also know the state of culture it has been in, and in which it is to be left by the out-going tenant, and the cultivation or tillage and crops the in-coming tenant has to take to and pay for, before we can attempt an estimate with any chance of approaching near to the sum required. Let us, therefore, suppose a case where a lease has just expired, and where a just and rational system of culture has been embodied in the conditions of it, binding the tenant after every seed-producing crop to have a root or dung-producing crop, to be all consumed on the farm; binding him also to apply all the manure to the production of the roots; and to continue this system from the beginning to the end of the lease; but giving him absolute property in all straw and manure of the last crop, for which, as it belongs to the farmer as much as the grain produced or the stock reared that year, he ought when he leaves the farm to get the full value. And, beside this, as half of the culture and the manure put on to produce the root-crop of the last year of his tenancy has not been exhausted, but remains in the soil to produce the seed-producing crop of the in-coming tenant's first year, the out-going tenant ought to have the full value of it.

It is not necessary, at present, to enlarge upon the merits of these conditions in a lease. Believing that they ought to be embodied in the clauses of all leases of arable land, I merely allude to them now as affecting the subject in hand—the capital which the in-coming tenant will require.

I suppose the farm to be one of 300 acres, 240 of which are arable, and the remaining 60 acres in permanent pasture. Of the 240 acres, say 40 acres, or a sixth part, is in Clover; 80 acres, or a third part, in roots or dung-producing crops; and 120 acres, one half of it, in Wheat, Barley, Oats—seed-producing crops. I suppose, further, that the term ends at Michaelmas, with a clause in the lease embodying the conditions already alluded to, binding the landlord or his in-coming tenant either to take to all or to any part of the 80 acres of roots, all or any part of the straw, and all or any part of the Hay (if the Clover be made into Hay) at a valuation, or to allow the whole, or what he does not take, to be disposed of, to be carried off the land; also to pay for one half of the value of the manure applied to the cultivation or tillage of the 80 acres of the root-crop of the last year; and if the Clover has been pastured by sheep being folded thereon, instead of being made into Hay, to allow the value of the manure which the stock has dropped during the time they have been depasturing it.

A farm entered upon under such conditions would be in such a state of culture, that the first crop of the land to the new tenant would be as productive as any of the crops which the last tenant had during the whole of his lease, and the amount paid by the in-coming tenant would be

returned to him on the consumption of the root and the Corn crop at harvest. And assuming that such cultivation-clauses as were in the last lease are continued in the new one, we proceed with our estimate of the capital required for such a farm; an estimate, viz., of the capital required to cultivate a farm of 300 acres, of which 240 is in arable culture, and 60 in permanent pasture: the arable land to be cultivated so as to have one half of it (viz., 120 acres) in Corn every year, and the other half of it in roots and Clover; 40 acres in Clover, and 80 acres in roots.

Working Cattle.			
To 8 working horses and a saddle-horse			£270 0 0
Implements.

7. Tillage and stock			745 0 0
8. Gross-rent for one year			637 10 0
			£4052 7 0

According to the above estimate, the farmer requires a capital of about 13*l.* per acre to cultivate arable land, under such conditions of entry as we have before named. Under these conditions the out-going tenant has no interest in running out the land during the last four years of his term; because he gets full payment for all the cultivation he has left in it, and also because he gets the full value of his last year's crop of straw and roots, either from the in-coming tenant or from public sale. The sixth item in the estimate seems large, but we have seen as great a stock of sheep, and of as much value, on many of the best-cultivated farms in Lincolnshire and Norfolk; and we suppose the root-crop, as in these districts, to be consumed by the farmer's own stock. The 7th item is a payment to the out-going tenant, for the good state of cultivation in which he has left the farm, and it is much less than the new tenant would have to sink in order to recover it into that state had he entered upon a farm which had been run out by his predecessor. I have sunk upwards of 800*l.* during the first two years of my tenancy, and got a farm not so large into a tolerable state of cultivation, without getting a single sixpence of return from it till towards the end of my term, during the last four years of which of course I endeavoured to take it all out again, knowing, from the nature of my term, that this was the only way I could ensure myself against loss. The 8th item contains the rent and parochial taxes, all these becoming due and requiring to be paid out of the capital before any of the crop can be brought to market.

According to Professor Low, a farmer's capital is not quite one-half the sum I have estimated it to be in the best-cultivated districts of Lincolnshire. This, however, may, I think, be explained by the mode which the Lothian farmers adopt of consuming their produce, and by their mode of entry and of paying rent. Thus, the 1st, 2d, 3d, 4th, and 5th items of the above estimate I believe give pretty nearly the amount required by the East Lothian farmer; but in the 6th item I think we shall find a very great difference. If it be true that the arable farmers in the Lothians and Roxburghshire sell all their roots, &c., to the hill or stock farmers to be consumed on their own farms by the other's sheep, then nearly the whole of this item of 1,085*l.* will not be required by them as capital; again, the 7th item will also have to be altered, for the term of the out-going tenant is, there, always May-day (although he gives up to the in-coming tenant all the land in course for Wheat at Midsummer, and all the stubble at Michaelmas); and, of course, he consumes all his roots and straw by stock in the coverts, converting it into manure, as this is the only article he is paid for by the in-coming tenant. This item may, therefore, be reduced to the value of 1,500 cubic yards of well-rotted dung, at 4*s.* per cubic yard; so that it will now stand at 300*l.* instead of 745*l.* Again, the 8th item must be struck off altogether, because the rent in the Lothians, as well as over Scotland generally, is made to become due 18 months after the term of entry; so that this 637*l.* 10*s.* is not regarded as any part of the farmer's capital. The gross rent in Scotland is generally paid to the landlord; there are no tithes, nor poor-rates, nor church-rates, and the only parochial rate is the statute-labour (the road-rate in England), which on a farm of this size may amount to about 4*l.* per annum. Thus, then, we have reduced our estimate, under the Lothian system, as follows:—

1. For working cattle			£270 0 0
2. Implements			459 3 0
3. Food for working cattle			266 0 0
4. Seed-Corn, &c. &c.			150 10 0
5. Servants' wages, Harvest work, &c.			439 4 0
6. Cows, pigs, say			100 0 0
7. 1,500 cubic yards of dung, at 4*s.*			300 0 0
8. Rent (statute labour)			4 0 0
			£1988 17 0

Or about 6*l.* 10*s.* per acre—nearly Prof. Low's estimate.

It only remains to add to these observations a few remarks on items 1, 2, and 5. The capital estimated as necessary under these heads is supposed to be spent in the purchase of everything that is best of its kind, whether it be strong and active horses, efficient and newly-made implements, or intelligent labour; for it is believed that capital so spent will yield a larger annual interest than a less amount spent in the purchase of third-rate horses, second-hand implements, or spiritless labour. Possibly the first two of these items might be reduced one-half by the purchase of horses and tools "good enough for a tenant-farmer," as the common but most erroneous saying has it, and I doubt not but that labour may be had in certain districts one-third cheaper than what I have estimated it at; and looking at this, many will say that the annual return from the employment of such, being nearly equal to that from the 1st class description of stock, which I suppose the farmer to purchase, and the expense of obtaining such being barely more than one-half of that which I suppose the farmer to incur; the interest yielded by the former must be nearly double that yielded by the latter; but it must be remembered that in both cases, in order to calculate the interest yielded by capital thus employed, we must subtract from its gross annual amount, so much as is necessary to keep the stock good; so much in fact, as, added to its value at any time, will enable the purchase of other stock of equal value with that which was purchased to begin with. It is the net annual return thus obtained which is the true interest of our capital. Now the rapidity with which second-hand articles wear out, the amount of disease and death amongst third-rate, *i. e.*, half worn-out horses, and the loss from idleness by the use of half-paid labour, are all so much greater, and in fact the money value of these losses is so much more than double that of the losses under these several heads, under the system I have recommended, and on which I have calculated, that when their respective amounts come to be subtracted from the gross annual returns of capital employed, with which they are respectively connected, even though these returns should be of equal value, which is not reasonably to be expected, I venture to say that the one will thus be so much more reduced than the other, that the annual interest or per-centage, derived from the less amount of capital invested in inferior stock, will be much less than that from the greater amount invested, as I have supposed it to be, in first-rate stock.

The subject of the "capital required by the farmer" is one necessarily of first importance to Agriculturists, and none could better occupy the thoughts or employ the pens of the readers of the *Agricultural Gazette*. I hope that a discussion on this subject conducted here may be useful in bringing out the truth of the matter.—*John Morton, Chesterhill, Stroud.*

The guano consisted of four different samples, distinguished by the marks above given. When applied it was mixed with sifted earth, and then sown in the bottom of the trenches, and well watered. The salts were applied after the plants appeared above-ground.

This result was obtained from the Bread-fruit Potato, planted in the London clay, well drained, and largely mixed with old plaster. The piece of ground was here and there shadowed by trees, so that the total produce was thereby diminished. It had borne a much heavier Potato crop the previous year, as is reported at p. 651 of the *Chronicle* for 1842.

It is sufficiently clear that there is much difference in the quality of guano, all these samples having been furnished by one of the most extensive importers, for the purpose of experiment.—*John Lindley.*

REPORT OF DR. VON MARTIUS ON GUANO.

(*Continued from page* 122.)

The proportion of soluble salts in the guano appears, from the two most recent analyses, to be much greater than in dove-cote manure. According to Klaproth they are only 16.5 per cent.; but according to Völkel they are 39.22 per cent.; and according to Vertels, 44.538. So that if the manuring power of guano be allowed to be in proportion to its soluble ingredients, it will be, in comparison to dove-cote manure, as 39 to 16 according to Völkel, and 44 to 16 according to Vertels. But we may very correctly estimate the manuring power of guano at a higher rate than its solubility, as the nature and combination of its salts are of importance. So that it would not be an over estimate to say, that the manuring power of guano is four times stronger than that of dove-cote manure.

These speculations are confirmed by practice. In Anequiqua, on the coast of Peru, if a field of Potatoes or Maize yielded an eighteen-fold produce with ordinary manure, it yielded, when guano was used, forty-five-fold of Potatoes, and thirty-five-fold of Maize. On the growth of Grass, according to experiments made at Hamburgh, it has an extraordinarily favourable influence. An experiment was made at Flotbeck, near Hamburgh, on a piece of grass, which bore a second cutting five days after the first, whilst double the length of time was required on the ordinary method. For the speedy growth of grass on dry soils, and for the improvement of poor meadows, which are common near Hamburgh, it has been strongly recommended in the Transactions of the Prussian Horticultural Society.

In Peru, three fanegas of guano, or about 714 French pounds, are laid upon a topo of land, which is about a Bava-

rian acre. In England, two cwt. (centner) has been added to an acre for Wheat, and four cwt. for Potatoes and Turnips. In England, on account of the facility and cheapness of transport, the guano seems to promise most. In Peru, a fanega or 238 French pounds, cost between three and five florins (from 5*s.* to 8*s.*). In Hamburgh it is sold at from 3¼ to 5 rix-dollars (from 9*s.* to 14*s.*) per cwt., according to the quantity bought. In Germany, the use of guano can only be recommended in Bavaria, where it is found to be cheaper than bone-dust or *Poudrette*. It is, however, very desirable that some of the rich possessors of land should try some experiments on the subject.

Guano recommends itself on account of its great concentration, and the facility with which it may be employed where heavier manures cannot be carried. It is very probable that many of the steep, stony, mountainous districts which possess at present little soil, but by further breaking down, promise a rich vegetation as soon as they shall be brought into cultivation,—such for instance as the steep ridges of hills in the Rhenish vine regions, would quickly repay the expense of manuring them with guano. But it must not be concealed that such culture in the first instance would require a considerable outlay of capital.

With respect to the peculiar nature of guano, from containing many volatile ingredients, which are lost by immediate contact with the atmosphere, it should be remembered, 1st, that it proves less beneficial for manuring in winter than in spring; and 2d, that it is used cheapest where it can be dissolved, and consequently where manure cannot be carried, yet where a spring of water exists, by which the guano may be dissolved, it may be used successfully.

In America, the farmer often takes a small quantity of powdered guano, about as much as he can hold in his fingers, and places it in a shallow hole at the root of any plant to be manured, and then pours over it a small quantity of water. Guano cannot be recommended in those districts of Germany where the expense of carriage would counterbalance its advantages, or where water cannot be easily obtained. In the cultivation of gardens it promises much, as well as for increasing the growth of Grass on pleasure-grounds.—*Munich, Feb.* 13, 1843.

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. VIII.

(Continued from page 123.*)*

Of the Inorganic Elements in the Composition of Plants.*

Lime.—Composed of calcium and oxygen, one equivalent of each—exists in variable proportions in almost all plants, and, consequently, must form part of the soil in which they grow. It is essential for the formation of bone in animals, hence the necessity for its existence in plants. United with carbonic acid, it is known to the farmer as chalk, marl, &c., with sulphuric acid as gypsum, and with phosphoric acid as phosphate of lime.

Phosphorus united with oxygen forms phosphoric acid, which again uniting with lime, forms the phosphate of lime above alluded to, and this is contained in considerable quantity in the husk of grain. Phosphate of lime is the form in which the earth of bones is deposited. Phosphorus is also essential to the formation of brain and nervous matter. Its importance, therefore, as an ingredient of the soil is evident, and the more so as it is the inorganic ingredient most deficient in all soils. Bran, which contains the phosphate of lime, is therefore a good manure when added to other ingredients. Crushed bones, of course, contain it in abundance, united with the azotised principle gelatine. In some remarks which have been made upon the experiments of His Grace the Duke of Richmond, the fact of the sulphuric acid which was added preventing the escape of ammonia from the decomposition of gelatine has been lost sight of. To be an efficient manure, phosphate of lime must be added to other species of food; thus in guano it is united with sulphate of ammonia; and in the experiments of Mr. Lawes, of St. Alban's, the union of phosphates of lime and ammonia succeeded best.†

Silicon united with oxygen, as silicic acid, and, again, with potash, as silicate of potash, is essential to the stiffness of stalk in the Cerealia. Wheat grows best on light lands, when they contain much silex in the form of fine sand.

Potash.—This, which is a compound of potassium and oxygen, is also an essential ingredient in the soil for agricultural purposes. If it is deficient, the stalks of the Corn do not become stiff, and are subject to mildew and other diseases. A gentleman in this neighbourhood, Mr. Boby, informed me that his father used to burn the straw from his farm for the purpose of procuring the potash. The consequence was, their crops became subject to mildew. The potash manufactory was given up, and the mildew ceased. Either potash or soda are necessary in the soil of all pastures or meadows, for without the alkaline base the cows would produce no milk.

Sulphur is found in most soils, and also as a constituent of plants. Its use in the vital economy is not exactly known, but that it is important is proved by its presence in the egg. With the exception of lime, it is the most constant inorganic constituent of animal structure.

Iron has a very important function to fulfil in the animal body. It exists as an oxide in the blood of all vertebrate animals, and serves the purpose of a "carrier of oxygen" from the atmosphere, through the lungs to all parts of the body. It is therefore an essential ingredient in the plants upon which animals feed.

* This part of the subject is so well handled in the papers now publishing in the *Gazette* by Prof. Sprengel, that I need do little more than allude to each.

† Vide *Agricultural Gazette*, 13th January.

The constituents of plants forming food for animals will stand thus:—

NON-AZOTISED.

Sugar, Starch, Gum, Oil, Fat, Wax — For supporting respiration and animal heat, and for the formation of fat.

AZOTISED.

Albumen, Fibrine, Casein — Restoration of waste, formation of muscle, and all other organic tissue of the animal body.

As existing in the gluten of Wheat, &c., the legumen of Peas, Beans, &c.

Inorganic Elements.

Lime . — for the formation of earth of bone.
Phosphorus — for the formation of brain, nervous matter, and earth of bone.
Sulphur — not known.
Potash or Soda. — for the formation of bile, milk, &c.
Iron . — as a carrier of oxygen.

Silica and Alumina are not used in the vital economy of animals.

The chemical composition of crops will be best considered in the next section, where I propose to treat at some length the subject of the practical application of manures.—*C. R. Bree, Stowmarket.*

(To be continued.)

ON MINERAL AND INORGANIC MANURES. No. IX.

By Professor Charles Sprengel.

Another very important substance contained in marl is the phosphate of lime. It neither occasions nor undergoes any decomposition in the soil, yet it improves the plants more than any other of the component parts of marl—it supplies them with phosphorus, so indispensable to vegetation. Phosphate of lime, as we know already, is not soluble in pure water, yet it dissolves in such as is impregnated with either humic or carbonic acid; from which it may be seen that it is important, even in this respect, that a soil to be manured with marl should contain humic acid. The quantity of phosphate of lime which the soil may obtain from marl is often greater than may be believed, because if the marl contain only ½ per cent. of the above phosphate, 20,000 lbs. of marl used on one acre will bring 100 lbs. on this area, which is enough for more than 100 crops; and there are marls which contain about 2 to 3 per cent. of phosphate of lime.

If marl contains gypsum, which is often the case, it is one of the most valuable of its ingredients, as it is well known how astonishingly this mineral substance promotes the growth of plants. Gypsum passes into plants without being decomposed, and is soluble in 450 parts of water. If any sort of marl were merely to contain ½ per cent. of gypsum, 20,000 lbs. of marl would bring 100 lbs. into the soil, and this would have a great effect on the first crops; and there are sorts of marl which contain 2 to 3 per cent. of gypsum.

Marl also generally contains common salt, which passes without decomposition into plants and nourishes them. By this substance, however, marl acts only for a short time, because common salt is easily soluble in water, and is only contained in the marl in very small quantities. It does not effect any decomposition in the soil.

A substance found in many sorts of marl, especially those of alluvial lands, is silicate of potash. It is not soluble in water, and therefore cannot serve as food for plants until it is decomposed by the humic and carbonic acids of the soil, and converted into humate and carbonate of potash, which are easily soluble in water. Some marls contain one per cent. of potash combined with silica; if, therefore, 20,000 lbs. of marl are conveyed on one acre, the soil will obtain thereby 200 lbs. of potash, on which account the effect of the silicate of potash, which is difficult of decomposition, will last for many years. Another ingredient of several marls of the alluvial lands, is silicate of soda. I have found in several of them so much as 1½ per cent., and as (like the silicate of potash) it is successively decomposed by the humic and carbonic acids, and changed into carbonate and humate of soda, such marl will supply the crops for many years with soda.

At times marl contains also an ingredient which will chiefly improve the growth of cerealia, and this is saltpetre. It will, however, act but very transiently, as its amount is mostly very small, and as it is too easily soluble in water for the furrow slice to retain it for any length of time; it neither induces nor undergoes decomposition, but acts directly on the plants.

(To be continued.)

MANX AGRICULTURE.—No. IV.

(Concluded from page 123.*)*

Before concluding this sketch of Manx Agriculture, it devolves upon the writer, as an impartial historian, to point out any circumstances of a counteracting nature, the knowledge of which may be essential to the personal comfort or the worldly success of an intending emigrant. The chief difficulty which the "stranger" (as every settler in this colony is called) has to encounter, arises not from an ungrateful soil, or a capricious climate, but from the state of existing Manx laws and institutions. The domestic government of the colony is vested in a Governor with his Council, and in the House of Keys. The latter was in better times elected by the people, but now consists of 24 self-elected and irresponsible men.

The island is happily free from the jarring contests of politics, and in a small agricultural community this must be considered as no social evil. Questions of church-rates, *pro* or *con*—the uneasy yoke of an income-tax, or of Queen's taxes, poor-rates, heavy turnpike tolls—vex not the spirit of the Manx farmer; for of all these he is happily ignorant. Little more is required to promote peace and harmony, than the faithful discharge by our Legislature and rulers of their responsible duties.

The present law of arrest is one of the greatest barriers to a stranger's comfort, and, as a consequence, to the island's prosperity. It will surprise the English reader to be informed that it is in the power of any Manxman to arrest a resident stranger (should he even be the lessee or the freeholder of 100 acres) for 5*s.*, nay for 5*d.*, if he (the native) will venture to make oath that he has heard and believes that the stranger is about to leave the island; or he can arrest for any sum above 40*s.* upon a mere loose affidavit that the debtor is not a native of the island.

The frequent facilities which fraudulent debtors possess for escaping to the neighbouring kingdoms, render it quite necessary that some check should be provided for the protection of the creditor; but the stranger has surely a right to expect that such protection should be reciprocal, and that he too, in case of need, shall have an equal right to arrest his Manx debtor. As the law now stands, he has no such privilege.

If he can positively swear that a native, in his debt, is about to leave the island (a subject upon which he may expect no previous information), he can arrest him; but, as before stated, *the stranger* is liable to summary arrest upon the loose oath of his creditor that he "is not a native of the island." Englishmen would almost stand aghast at the tyrannical and galling manner in which the law may be, and often is carried into effect.

The debt may be altogether a fallacious one, or it may arise upon a disputed account, or, what is worse, may be a mere speculative action for damages, as for a libel, an assault, &c., which when brought before a Jury falls to the ground, or perhaps is never brought before a Jury, because the stranger would oftentimes prefer to submit to extortion or to a robbery rather than be torn from his family and his property; the former to be afflicted, and the latter to be distributed during his incarceration. But setting aside commercial engagements (which are allowed to require some extra protection), it is an unpleasant part of the writer's duty to state that the tenant-farmer is placed in a still less enviable position. The laws endow the landlord with the power of arresting for rent before it is due: a tenant may enter upon a farm at Lady Day, or at any other period; he may stock, manure, clean, and crop it, and yet the landlord has the power to arrest the man and imprison him until he finds security for the current year's rent; and, although he may have in hand to-day his landlord's receipt for rent due yesterday, he may to-day be called on to find security for the next year's payment. It is an ungrateful office to announce that such senseless laws should exist in an island claiming to be civilised, and situate within a day's journey of the metropolis of the world; but it would ill accord with the writer's duty to leave these facts unnoticed.

It is but just, in conclusion, to state that an active, industrious farmer, with adequate capital and of conciliating disposition, will find little practical obstruction from these causes. Let the Legislature of the island, who may literally be said to hold the "keys" of its prosperity, only unlock its resources by the timely improvement of its institutions; let it hold the scales of justice fairly balanced between the native and the stranger, and Mona, if not destined to become, in the language of the poet—

"The first flower of the earth,
The first gem of the sea,"

may nevertheless remain the abode of industry, plenty, and harmony; and should be content if, in the peaceful contests of civilisation, commerce, and Agriculture, she can give full effect to her ancient motto of war—

"Quocunque jeceris stabit."

—*Cultor.*

Home Correspondence.

On Gorse.—My attention has been drawn to an article on "Gorse, as a Winter Food for Horses," in your Paper of the 3d ult., and as I can speak from experience, I herewith send you a few remarks on the culture of the Furze—its preparation for food, and its results, as a winter food for all cattle, but more especially for milch cows. Furze will grow well on any soil which is of a dry, gravelly, sandy, or loamy nature. The seed should be sown about the beginning of April, in drills one foot apart, after the land has been made as clean as possible. As soon as the plant appears, the ground should be hoed. In the February following, you may brush off with a scythe what little crop there is, for litter. Continue hoeing till the following November, when you may begin to cut for food; the crop will be comparatively small, but much better the following year. No manure whatever is required in any stage. The period for commencing cutting must be regulated by the season, from the latter end of October or beginning of November, till the middle or end of March, when the sap begins to rise, and the cattle do not relish the food so well. A labourer cuts and carts home sufficient for a day's consumption with a short strong scythe, such as is used for mowing rough grass, or for stubble cutting. On Saturday enough must be cut and prepared for the following day, and to prevent fermentation it must be spread thinly on a barn floor, or other boarded place; and perhaps some chaff mixed with it would assist in preventing fermentation. The least expensive method of preparing the Furze for food, is on a floor of Oak or Ash stubs, raised about 16 or 18 inches above the level on which the labourer stands to chop it. The floor should be about seven feet long and three wide, quite level, and the stubs or blocks of wood both firmly and nicely fitted together; and if placed in the corner of a barn or lodge, additional firmness would be secured by making the building form the back and one side. Round the outsides, in order to prevent the Furze tumbling out, must be placed a strong skirting

board, about seven inches higher than the floor. A certain quantity of Furze, as brought from the field, is trodden down on the floor. The instrument used for chopping is a wooden-headed iron-bound cleaver (such as is used for driving wedges), into the head of which are driven two knives, let into each other at right angles, and wedged together at the bottom. The subjoined is a wood-cut of this instrument, placed so as to show its knives.

The Furze is chopped till the prickle is so subdued that it can be masticated without inconvenience. An able-bodied man will prepare from 20 to 25 bushels per day. If this system (which we will call for distinction, the chopping system), does not prepare a sufficient quantity of Furze for your horses and cows, resort may be had to the grinding system, which is done by the stone cider-mill, as used in the counties of Gloucester, Worcester, and Hereford; it is better that the trough and wheel be shod with iron. There is only one objection to the iron, which is, that sheep will eat, and like other animals no doubt, eventually like the Furze, but they dislike (as I believe it is generally allowed) any food bruised with iron. Preparatory to the grinding, the Furze goes through Passmore's chaff-cutter, which may be worked by hand or by a fly-wheel attached to the axis of the cider-mill. The Furze, cut to the length of an inch, is then ground in the mill till the prickle is completely destroyed. The expense of this apparatus cannot well be reckoned under £*, while that for "chopping" may be erected for about 60*s* I have seen other plans for bruising Furze. The specimens exhibited at the Royal Agricultural Society's shows were none of them I believe considered of sufficient merit or utility to entitle them to the premiums. Much, however, as it is to be desired that some plan might be invented, whereby small occupiers and poor persons living on commons or wastes, may convert the wild growing Furze into food for their cows during the winter, I am inclined to think, from what I have seen of the working of the various implements, that those only which involve the principle of a heavy roller on a plain hard surface, can do the work speedily and effectually. As to the quantity of food to be given to each animal, this must depend on their size and constitution, and it will require the constant watching and judgment of the feeder. For some cows, three bushels will be sufficient; others will consume four bushels per day. A small quantity of salt should be added to every feed, and as Furze is of a binding nature, a single root of Mangold Wurtzel should be given each day, either before or after one of the feeds, when necessary. A bait of Hay, from three to five pounds per day, may also be given to each cow or other animal, but it is not in all cases necessary, as from the time six Alderneys were put into the yard, up to the 6th of April, 1840, they did not have a single blade of Hay, and instead of Mangold Wurtzel, about a month before and after calving, they had a few white round or Swede Turnips. The quantity of salt, the size of the root of Mangold Wurtzel, and the Hay (if given at all), will be regulated by the feeder's observation of the animal's excrement. One acre of tolerably strong Furze will keep two cows about 20 weeks. The Furze must be of one year's shoot only, and cut close to the ground, and if the whole of the field is not used, it must be mown off about March. At this time it is necessary that the person usually cutting the Furze should examine the whole field, and cut off close to the ground any stubs that may have been left, otherwise they become next year too strong for the scythe. On food prepared as above, the cows do well and are healthy, and the quality of the milk and butter is very much improved both in sweetness and richness. I am inclined to think that your correspondent has been misinformed about the large dairy now at Birmingham of two hundred cows kept on Furze during the winter: it may be the case; but I think it more probable that his informant has heard of an establishment that has been for many years kept by a gentleman near Worcester, to whom your readers are indebted for the subjoined figures; being a comparative estimate of the expense of feeding 24 cows per week on *Furze* and *Hay*, computed with the greatest accuracy.

Furze principally.				*Hay entirely.*			
560 bushels of Furze, cost 3*d.* per bushel grinding .	£1	15	0	2 ton 16 cwt. at 4*l.* per ton . . .	£11	4	0
Cost of cutting and carting home .	0	16	0	Man's time . .	0	12	0
					11	16	0
24 cwt. of Hay, at 4*l.* per ton . . .	4	16	0	Expense of Furze .	8	9	0
10 cwt. of Mangold Wurtzel . . .	0	10	0				
Man's time . .	0	12	0				
	£8	9	0	Difference in favour of Furze .	£3	7	0

I have endeavoured to lay before you these facts as clearly as possible, and must leave your readers to judge of the value of the Furze from these statements, which are grounded on the experience of several years.—*Vigora.*

Lucerne.—I send you the following extract from Professor Low's work on Agriculture, on the cultivation of this plant.—"The best period of sowing Lucerne is at or before the middle of April. When sown broadcast the quantity of seed per acre may be 16 or 18lbs.; and when sown in rows 10lbs. The soil should be well prepared by deep ploughing, and a previous summer fallow or fallow-crop, such as potatoes, turnips, &c. When drilled, the rows need not be more than 18 inches apart, which will give room for tilling the intervals by the horse and hand-hoe. After the seeds are sown, care must be taken to keep down, by means of the hoe, all weeds that spring up amongst the plants, and in the rows. In the month of August of the first year, when in flower, the crop may be mown, and after this cutting, the shoots may be kept down by a slight pasturing with sheep, but not while the soil is wet, nor continued till a late period. Early in the following spring the ground is to be horse or hand-hoed, so that all weeds may be kept down, and the earth stirred about the roots of the plants. In the month of May the crop will be ready for the first cutting. After being cut, it is to be horse-hoed in the intervals. It will now grow very rapidly, and when ready for cutting is to be cut again, and after each cutting hand-hoed; in this manner it may be mown four or five times in the season; it does not, however, arrive at maturity till the third year; it requires to be manured at intervals, as every fourth or fifth year; the manure may be farm-yard dung, spread upon the surface after the last cutting in autumn, or early in spring."—*M. S.*

Seaweed as Manure.—The Isle of Thanet is celebrated for its fertility. It sends a great quantity of the very best Wheat to the London market, and produces, in addition to the more common grain, large quantities of Carraway, Coriander, Spinach, Radish, Canary, and other seeds. In many parts of the island the soil is naturally very shallow and poor, but these are rendered extremely productive in consequence of the extensive use of Seaweed as manure. This appears to be a comparatively modern usage. Lewis, in his History of Thanet, written in 1723, in a short account which he gives of the system of agriculture followed in this island says, "Within these few years past the inhabitants of the North and East side of the island next the sea, have made great use of the Alga or Sea Woor, which is often cast up by the sea in great quantities under the cliffs. This the farmers carry on their maxhills, where they mix it with their other dung, which it helps to rot. In this mixture they observe no proportion, but endeavour to have one layer of dung and another of Sea Woor, which they turn once or twice in the summer in order perfectly to mix and rot it. But it is observed that the Sea Woor is not so kind for the land lying near the chalk as for the colder land; and that where the land is very cold the best way is to carry out the dung rough, without laying it into a maxhill at all. The stench of this weed when first laid on the maxhills is very nauseous, but as it is in the open fields, is the more tolerable." The Seaweed is now one of the mainstays on which the farmer who is near enough to the coast depends. Deep cuttings have been made through the chalk cliffs for the convenience of carting up the Seaweed; and as this is very hard work for the horses, the team is in general peculiarly good. They do not wait for any decomposition, but collect it as soon as it has been thrown up by the storms. The common custom is to lay alternate layers of Seaweed and sand, which are turned frequently till the whole is decomposed. I have not heard that the manure is not found as good for the shallow land; indeed, I believe the present fertility of a considerable portion of the land depends mainly on the use of this manure. Neither, again, have I heard that after a series of years the land becomes deteriorated by the presence of magnesian salts. Seaweed is, I believe, sometimes used on the coast of Scotland in its rough state as manure, without any previous decomposition, and is considered very good for Potatoes. I don't know whether its use is at all general. The Potatoes in the isle of Thanet, it may be remarked, are peculiarly good, which may possibly arise from the use of this manure.—*M. J. Berkeley.*

Rats.—Seeing that you recommend "Nemo" to smear the holes and passages frequented by Rats with arsenical ointment, I beg to state, that as accidents frequently happen from the use of poison, perhaps some other method might be acceptable. Slice a number of corks as thin as sixpences, and then roast or stew them in grease, and lay them in the way of the rats; these will prove a delicacy, and will be speedily devoured; the rats that partake of them will die of indigestion. Another method is to cut a piece of sponge into small pieces, and fried and dipped in honey; these are placed along with shallow pans of water in the neighbourhood of their holes. By eating the sponge, and then satisfying the thirst which it produces, their stomachs become so distended, that it generally proves a fatal repast.—*Herbert, Sussex.*

Waste Lands, &c.—I quite agree with "H." in thinking that "A National Agricultural Society" should be formed to bring into cultivation the waste lands of the British islands, and to inclose and reclaim from the sea and at the mouths of large rivers, the vast tracts of land which now are not only lying useless, but are dangerous to navigation. When so many hands are now unemployed, and when so much capital is lying useless, no time could be fitter than the present for the formation of such a Society, and I hope it will be taken up in earnest.—*P.*

Manure Dropped in the Field.—By neglect of the simple means I pointed out in No. 4, page 59, *Agricultural Gazette*, the greater part of the manure made in the fields is lost, the common practice being, to allow it to remain until the spring, when it is knocked and spread about. But the misfortune is, that by that time it has become like so many masses of dried turf. It is in reality then deprived of all its fertilising qualities by atmospheric influences, whereas, were it managed in the way I have described, I am quite sure that the results would be most beneficial. I would suggest that profitable employment would thus be afforded for aged persons, who are incapable of more laborious work, and for women. It would be much better and more economical paying for this labour, than laying out money in foreign, or any other manure; and the poor and the infirm would be happier and better satisfied thus engaged, than if imprisoned in a workhouse. If those who read these observations would only just try the plan recommended, they will soon find how easy it is to improve their land without being at any material expense, for the means are always at hand, and only require application. There is another subject which I beg to bring under the notice of your readers. In almost all parks, woods, and plantations, that have come under my observation, I have remarked that the annual waste of the leaves of trees is very considerable; I mean, these are suffered to be dispersed, and have their virtues, as a manure, nearly dissipated by the effects of drying winds. They are sometimes collected by the gardener, who is the only individual who appreciates their value as an ingredient for the composts he requires. If, instead of wasting them, gentlemen would allow the poor, when unemployed, to collect in the woods or fields, the leaves, weeds, and moss, and then purchase it from them at a reasonable rate, what a valuable supply of litter it would bring to their piggeries and sheepcotes. When spread in the yard, and mixed with the dung, it would add greatly to the quantity and quality of the manure, especially if collected soon after the fall of the leaf, before its fertilising properties were diminished. I am inclined to think that manure thus made would be much better than if made from straw alone. Leaves mixed with dung make excellent manure for Potatoes on strong land. They might be employed in sheep-cotes during the lambing season, as litter for the ewes. After being in this way enriched by the dung of the sheep, if mixed with earth and well decomposed, it will form a most valuable and cheap compost; and if simple vegetable leaf-mould is of such vast importance to the Horticulturist, what would it not be in this enriched state to the Agriculturist, for his Grass, grain, or root-crops? Cottagers, also, are often at a loss for litter for their pigs, and farmers do not like to diminish their own manure by giving or selling their straw; but leaves would answer the purpose perfectly, if gentlemen would permit them to be collected from their woods for the purpose. Those who approve of these suggestions will, I trust, point out to the cottagers such an easy way of procuring good litter, giving them permission, at the same time, with certain necessary precautions, to gather as many as they want. The fertility of their gardens will then be increased, and feelings of good-will towards their employers will be excited. —*W. Billington, Underhill.*

Manure dropped in the Fields.—The plan laid down by Mr. Billington is a great improvement upon the present practice of totally neglecting the manure dropped from cattle in the fields. Through him it is that you have the excellent communication of "R. F. S.," whose practice deserves the particular notice of all graziers. By collecting all the manure and placing it in different situations in each field, say one heap in each corner, an opportunity is afforded for making a valuable compost each year. And these fertilising means will be derived from sources which have, as Mr. Billington justly says, been "hitherto almost wholly neglected."—*J. West.*

Lime.—There are few counties in England where lime is more universally used as a manure than in Devonshire. The farmers apply it both to the Wheat and Turnip crops, and many fields I was assured had never received any dung or other fertilising substance during the memory of man. At Castle Martin, in the north of Devonshire, the limestone rock abounds, and is burnt for agricultural purposes; but limestone from South Wales also is brought by vessels to be burnt there, and is preferred by the farmers although selling at a higher price. I collected some samples of both, which yield the following analyses. It appears from these analyses that the value of limestones for agricultural purposes depends in a great degree upon the quantity of carbonate of lime contained in them.

ANALYSES OF LIMESTONES.

—*J. B. Lawes.*

"*Ought Potatoes to be cut or planted whole?*"—I am in the habit of planting five or six acres of Potatoes yearly, and for the last two years I have planted the greater part with whole Potatoes, and find they produce as good crops as with cut sets, with this great advantage, I have scarcely a Potatoe misses growing, whereas in cut sets I have often had a great loss from dry rot. When taking up the general crop, I pick out my seed Potatoes of a uniform size, each weighing about 1½ oz. I plant them in rows two feet apart, and one foot in the row, and have had exceedingly good crops.—*A. C. Horncastle.*

Seed Wheat.—I last year made the following experiment, the repetition of which I think may prove interesting and valuable to Agriculturists; and, as I have not leisure nor convenience to pursue the subject myself, perhaps some of your readers may be inclined to do so. I took 12 ears of Wheat; from each of the ears I took the top corn, and sowed them in one flower-pot. I then from

* It is impossible to state any definite sum, as the carriage of the stones composing the mill will vary so much, with regard to distance, land or water carriage. The stones themselves at the pit are not so very expensive.

each of the ears took the corns next to the top, and sowed them in another pot, and so on till I had 12 pots, each containing the corns from corresponding parts of the 12 ears. My object was to see whether or not the corns from all parts of the ear were alike valuable for seed, and if not, what corns were the most valuable. As far as my experiment went, the corns taken from the middle of the ear were decidedly the best.—*D. C.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's house, on Wednesday last, the 28th. Present: W. Miles, Esq., M.P., in the chair, T. Alcock, Esq., T. Raymond Barker, Esq., Rev. T. C. Browne, F. Burke, Esq., Col. Challoner, F. Clifford Cherry, Esq., H. Colman, Esq., A. E. Fuller, Esq., M.P., H. Gibbs, Esq., B. Gibbs, Esq., W. H. Hurst, Esq., P. Pusey, Esq., M.P., Professor Sewell, and T. Villiers Shelley, Esq. The following new members were elected:—

Stretton, William R., Dairy Park, Crickhowell, Brecknockshire.
Whitby, M. P., Newlands, Lymington, Hampshire.
Marsh, John, Lydgate Hall, near Sheffield.
Gillespie, Robert, 33, York Place, Portman-square.

The names of 19 candidates for election at the next meeting were then read.

Cottage Tracts.—The Secretary reported the distribution of 15,000 copies during the past two years, of the articles on Cottage Gardening, by Mr. Main; and on Cottage Economy and Cookery, by Mr. Burke, reprinted from the Journal in the form of distinct Tracts, and sold to members at the prime cost of one penny each. The Council ordered that the question of a further reprint of 6000 impressions of these Tracts should be referred to the monthly meeting on the 6th of March.

Drainage.—Mr. J. Clarke, of Long Sutton, Lincolnshire, informed the Council that little or nothing having been yet done to improve the drainage of the low-land district, near Wisbeach, in which he resided, it had been his wish to draw public attention to the subject, and he had accordingly drawn up a work, of which he then presented a copy to the Council, on "Thorough Draining in Principle and Practice," with its advantages and simplicity as applied to a dead level, addressed to the owners and occupiers of the soil in the parts of Holland, in the county of Lincoln, and the great level of the Fens, for which the Council ordered their best thanks to be given to Mr. Clarke. Colonel Challoner gave notice that he should on a future occasion propose that the Society should offer a prize for a practical Essay on the best mode of draining sandy land.

Southampton Meeting.—Mr. Shelley, as one of the stewards appointed for the Southampton Meeting, informed the Council, that agreeably with the directions of the General Southampton Committee he had, in company with the Messrs. Gibbs, visited Southampton on the previous day, for the special purpose of making the requisite arrangements for the ensuing Show of the Society in that district, and now presented to the Council the joint report of himself and those gentlemen on the results of their personal visit and inspection of the localities proposed for the adoption of the Society, and the conditions under which they were offered. Mr. Shelley having read the report, and detailed to the Council the ruinous propositions made to them by the authorities of Southampton, and the great difficulties which presented themselves at every stage of the proceedings, concluded by giving notice that he should move at the next monthly Council to be held on the 6th of March—

That, owing to the difficulties alluded to in the Report of the Stewards, the propriety of holding the Annual Meeting of 1844 at Southampton be reconsidered.

Mr. Gibbs also gave notice that he should, at the same time, move the following resolutions:—

1st. That the bye-law regulating the selection of the place of holding the Annual Country Meeting be suspended.

2dly. That in future the place of holding the Annual Country Meeting shall not be decided upon, until three Members of the Society, who have acted as Director or Stewards of the Yard, shall have visited and inspected the several towns and their localities, and have reported upon their respective fitness for the purposes of the Society.

The Southampton Committee immediately held a meeting for the purpose of enabling them, by reference to all the documents in possession of the Society which had been received from the Mayor or other authorities in reference to the Meeting of 1844 at Southampton, to lay before the Council the specific declarations which had induced them to prefer the site of Southampton to that of other places which had been offered to the Society for the purpose of holding that Meeting.

Sir John William Lubbock, Bart., communicated suggestions on the subject of farm-buildings and cottages, which were received with thanks, and referred to the Journal Committee; Mr. Cottam applied for leave to exhibit at his lecture on the Mechanics of Agriculture, at the Royal Institution, on the 8th of March, the Society's model of Lord Ducie's Uley cultivator; and leave was granted accordingly. Mr. Rickards presented to the Society a copy of his "System of Agricultural Accounts;" Col. Greenwood a copy of his "Tree-lifter;" and Professor Royle, on the part of the East India Company, a collection of Pine-seeds, received from the Company's botanic garden in the north-west of India: for which the best thanks of the Council were ordered.

The Council then adjourned to Wednesday next, the 6th of March.

FARMERS' CLUBS.

Wrentham.—At a recent meeting of this Club, a discussion took place on the most effective means of hindering the destruction of the Wheat-plant by slugs and wire-worms. With regard to the former of these, several remedial measures were stated to have been pursued; the application of soot, lime, or common salt, in small proportions, had each been attended with some degree of success. It would appear necessary that the application of any of these substances be in the night only; for, unless the slugs are exposed at the time of sowing, such measures would prove ineffectual. Another plan pursued was that of slicing Turnips about the land; but the most beneficial effects were experienced by strewing the land with the tops of Turnips only, and in sufficient quantities to afford ample food for these mollusca. Where this latter system has been adopted, the result has generally been, that the plant of Wheat has been preserved, while the leaves of the tops have been almost entirely consumed. The injuries done by slugs are principally confined to an early stage of the Wheat-crop, while the ravages of the wireworm frequently extend over a length of time, and affect the crop at different periods of its growth. In reference to the latter, early ploughing, and afterwards obtaining a sufficient degree of solidity, may be considered as practically amongst the best means to be taken as a preventive. The effects of such a system have also frequently been apparent, not only as a protection from wireworm, but with reference to the ultimate value of the crops. The wireworm is generally most destructive on lands which have been fed through the summer, and also on others where the previous layer was not good. In these cases, shallow ploughing, as well as an additional quantity of seed, were recommended. Treading the land by sheep after the seed is deposited had also been practised, with a view of obtaining more solidity. When, however, the crop is affected in the spring, as (notwithstanding these precautions) is too frequently the case, the greatest benefit appears to have arisen from lightly breaking the soil, either by light harrows, or even raking, as early as circumstances may render practicable. A resolution was passed in accordance with these observations.—*J. D. Robinson, Assist.-Sec.*

Reviews.

The Application of Geology to Agriculture, and to the Improvement and Valuation of Land, with the Nature and Properties of Soils, and the Principles of Cultivation. By Nicholas Whitley, Land Surveyor. London. Longman, Brown, Green, and Longmans, 1843.

This work furnishes an example of the prevalent rage for giving to Geology, applied to Agriculture, credit for more than really belongs to it. The author says in his preface that he has been led to enforce the application of Geology to Agriculture, to which he hopes he has succeeded in demonstrating it to be no less valuable, as an auxiliary, than it has been in the development of mineral wealth; and he enforces the application of Geology to Agriculture, by such arguments as the following:—"But whilst improvable land is worth more than its apparent value, improved land is worth less. If the improvement is substantial and permanent, the full benefit of the increased yearly value is obtained; but this is not always the case; the drains may give way, or become blown, the river may burst the embankment, or a high and forced state of fertility may require such expensive manures to keep it up, that a lower standard of produce would prove the most profitable mode of culture. Geology leads us to detect these circumstances." We should be glad to know how. We had thought that questions as to the sufficiency of drains, the strength of embankments, or the economic value of a given mode of cultivation, were to be solved, not by the Geologist, but by the Engineer and Agriculturist. And so it is throughout, whether it be the classification of soils, the valuation of land, the improvement of its texture, and chemical composition by adding from other strata ingredients in which it is deficient—by draining and subsoil-ploughing, in order to rid it of superfluous moisture—by ploughing in a crop of Clover, in order to increase the humus in the soil; or whether it be the detection in improved land of plethoric symptoms indicating a tendency to apoplexy such as have been mentioned above—everything is ascribed to Geology. Such exaggerated pretensions must ultimately do harm by producing a reaction, and leading to a disparagement of the value of geological knowledge to those engaged in the valuation and improvement of land.

The application of Geology to Agriculture may be said to have commenced with the infancy of Geology itself as an inductive science. William Smith endeavoured to render those studies, by which he established the order in which the sedimentary rocks succeed one another, subservient to his professional duties as a land and mineral surveyor and agricultural engineer. But his views, as Professor Sedgwick has said, were in advance of the age, and he suffered, as many men of genius suffered before him, in his peace and his pecuniary prospects, from that which constitutes his glory among geologists, and earned for him the title of the Father of English Geology. Conybeare and Phillips, in their "Outlines of the Geology of England and Wales," blended with their descriptions of the different formations, notices of their agricultural characters. Dr. Buckland, in the opening of his "Bridgwater Treatise," took a rapid glance at the effects of the geological character of different districts of England, in influencing the nature of the industrial pursuits of their inhabitants, and, by consequence, their numerical amount, their wealth, the amount of health and longevity enjoyed by them, dependent on the salubrity or insalubrity of their employment, together with their moral condition as affected by that employment. Sir H. De la Beche, in his "How to Observe," remarked on the superior fertility observable at the junctions of strata, arising from the intermixture of their constituents, expressing surprise that effects so evident should not have oftener led farmers to seek improvement by similar artificial mixtures of adjoining soils. In his report on the Geology of Cornwall and Devon, he has devoted a chapter to the relations between the Agriculture and Geology of the various districts comprised in the survey—a field which had previously been broken by Dr. Paris in communications to the Geological Societies of Cornwall. Professor Johnston of Durham has more recently treated of the connection between Agriculture and Geology in his lectures on Agricultural Chemistry and Geology. But the first Agriculturist who studied Geology purely for its practical value in the discrimination, improvement, and valuation of land was Mr. Morton, who, in his work on soils, has given the results of his personal examination of every part of England, with that object in view, during a period of years. From these sources, as well as the works of Davy and Liebig on Agricultural Chemistry, and all that has appeared of late in the Journal of the Royal Agricultural Society, on draining and subsoil-ploughing, Mr. Whitley's work is drawn. The volume is a compilation throughout. To this we do not object when a work is fairly announced as such, for a compilation may be more useful than the many and expensive works of which it gives an epitome, and to which, as authorities, it refers for all its statements which are not original. But when it lays claim to originality, its pretensions cannot be allowed to pass as current coin without examination. The Author of the work before us says that his is "principally compiled from notes and observations made by him in various parts of the country, and that though he is conscious of its many imperfections, he feels emboldened in laying his facts and opinions before the public, by the consideration that the subjects here treated of have not received from practical men that attention which they deserve; and by a conviction that, at the present time, when artificial manures are so extensively used, it is of especial importance that the attention of all parties connected with Agriculture should be directed to some more accurate data from which to deduce the value of land, than that which a surface view, abstractedly considered, affords. The soils which occur in the west of England are those which are most fully and particularly described." There is, as we have said, scarcely anything in the book which is the result of original observation. Even for his descriptions of the West of England, that is, of Cornwall and Devon, he has recourse to Paris and De la Beche, sometimes with, sometimes without acknowledgment. He has gleaned, industriously enough, in every field, making notes and observations, no doubt, of what he read, in whatever part of the country he happened to be, but he has not always been satisfied with legitimate gleaning, making free, occasionally, with the sheaves, and stating, as his own, the facts and opinions of others. Like most gleaned corn, too, the sample is unequal, occasionally containing a mixture of defective grain, with that which is sound—of old and new theories without attempt to discriminate between them. Thus, for instance, at p. 115, he ascribes, with Liebig, the exhausting effects of Corn crops to the large quantity of the alkalies which they extract from the soil, and the beneficial effects of Turnips and other fallow crops, to the small quantity of inorganic food which they require; while in the Appendix A, we have a table of the constituents of plants, from which, if Mr. Whitley will take the trouble of making the calculation, he will find, that while four quarters of Wheat and 3000 lbs. of Straw take from the soil little more than five pounds of potash and about the same quantity of soda, a crop of Turnips, weighing 25 tons, or 56,000 lbs., will take up 40 lbs. of potash and 61 lbs. of soda. With silica, however, it is quite the reverse. The Wheat crop contains full 93 lbs. of it, and the Turnip crop not more than 29 lbs. Thus a bare fallow, or a fallow crop not requiring silica, may operate beneficially by the time which it affords for bringing the slowly soluble silicates of the alkalies into solution, and thus presenting the cereals with silica, not potash, in a form capable of being assimilated by them. The author is likewise involved in similar inconsistencies from attempting to adopt both of the opposing theories respecting the assimilation of carbon by plants. We are told, for instance, p. 62, that "although humus is only slightly soluble in water, humic and ulmic acids, which are modifications of humus, unite and form soluble compounds with alkalies. Alkaline earths exist in the soil in sufficient quantities to form such compounds. It is therefore probable that humus not only forms a source of carbonic acid, but also enters into plants in a liquid compound through their roots." At p. 107 it is said, that "decayed animal and vegetable matter (humus) is of the first importance in manuring. Without its presence in the soil, the application of mineral manures will be of little service. If it does not exist naturally in the soil, from the decay of vegetation, it must be supplied artificially." At p. 108 we read, "It appears that three-fourths of the substance of plants usually cultivated is derived from the air, and it is on this fact that the principle of green manuring is founded. If a crop of clover be grown, and ploughed in when it begins to flower, it will give to the soil four times the amount of humus which it extracted from it. Land which is rich in the inorganic food of plants, may, in this manner, be furnished with a proper quantity of humus."

In taking a view of this plan for improving land from a practical point, we think it would be found much more profitable, having obtained such a crop of Clover, to feed it off on the ground with sheep, than to plough it in; and that such a proceeding would be equally beneficial to the land.

Notwithstanding these defects, however, Mr. Whitley's compilation, though somewhat slight and superficial, is not badly made. We have no doubt he will find the knowledge which he has acquired from the works he has read useful to him in his profession; whether that which he has to impart may not be better learned from "Morton

on Soils," and "Johnston's Lectures on Agricultural Chemistry and Geology," admits of a question. His work, however, may fall into the hands of those who would not have purchased the above volumes, and it may induce others to commence the study of the subject of which they treat, who will not be satisfied with the taste Mr. Whitley has given them of it, but will be led to drink at the fountain head. At all events the reputation of being a geologist and a chemist will now be as advantageous to the author, in his profession, as it would, a few years ago, have been detrimental to him; and we heartily wish him success.

In the following sober and judicious summary of the benefits to be derived from Geology in the improvement and valuation of land we fully concur. We give it as a specimen of Mr. Whitley's most successful manner of treating his subject:—

"1st. Geology offers to the practical Agriculturist essential aid in affording the means of definitely describing and classifying the various soils, thereby enabling him to apply to the land he cultivates those means of improvement found by experience to be suitable to any particular soil. 2d. Geology enables us to infer, from the mineral constituents of the parent rock, the chemical composition of the soil, and hence, to select such plants as may be most adapted to it. 3d. Geology points out the causes of fertility or unproductiveness, with the manure generally adapted to any particular soil, and the means by which waste land may be effectively reclaimed. 4th. Geology is of essential importance to the land-valuer, not only furnishing him with the information stated above, but enabling him to distinguish temporary fertility or exhaustion of land from its natural productiveness, and supplying him with data from whence he may estimate with some degree of certainty the value of the unexplored mineral wealth."—*E. W.*

Miscellaneous.

Agriculture in France.—On Monday the Central Congress of Agriculture opened at the Luxembourg its first session, the duration of which is fixed by the rules at one week; the Duke Decazes presided. More than 250 Agriculturists from different parts of France, a great number of Peers and Deputies, and members of scientific societies were present at the meeting. The bureau is composed as follows:—President, the Duke Decazes; Vice-Presidents, MM. de Gasparin, de Tracy, the Marquess de Torcy, and M. de Caumont. After having agreed upon all the questions to be discussed, the Congress entered upon those of Agriculture, Education, and Experimental Farms. Several able speeches were delivered. The members then formed their committees, and adjourned at half-past four till the following day.

Caution to Farmers.—Last week, four bullocks belonging to Mr. Lee, of Neopardy Farm, Crediton, died suddenly, without apparent cause. Mr. Reed, veterinary surgeon, found, on searching their stomachs, a quantity of the common Yew, mixed with the other food. On opening the skull, the membranes of the brain appeared in a very congested state, the poison having acted on the brain and nervous system, producing symptoms resembling apoplexy. A few days before, Mr. Lee had cut down a Yew tree, and two or three of the faggots were left where the animals had free access, and having been for some time deprived of green fodder, they ate it with great avidity.—*Western Luminary.*

Guano from Africa.—We have this morning seen a private letter from Liverpool, in which is the following important information:—"The first vessel from Africa with Guano arrived here yesterday afternoon—the Levenside, with 400 tons, full cargo. She reports a great number of vessels, some loaded, some partially so, riding off the island, and from the information which I have been able to receive, we shall shortly have a very large quantity from that quarter. The Levenside's cargo is on Glasgow account, and the captain set off for Glasgow a few hours after arrival at this port." We find from the Clyde shipping-list that the Levenside sailed from the Clyde on the 20th of September, having cleared out for Valparaiso, and comes to Liverpool from the island of Angia Pequena, coast of Africa.—*Ayr Advertiser.*

Notices to Correspondents.

RURAL CHEMISTRY, By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4*s.* 6*d.*

OUR CORRESPONDENTS will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*J. J. Mechi, Woodend, D. C., A. Huxtable, J. Steele, R. Spooner, P., F. Davies, Northumbriensis, An Old Subscriber, J. Drummond, F. Singer, W. Billington, W. B. Booth,* and *G. Anderson.*

CHEAP WATER-POWER.—*Anonymous.*—The cheapest water-power is one invented and patented by Mr. T. Burstall, manufactured at the Uley Iron Works.

CONVERSION OF SULPHATES OF POTASH AND SODA INTO CARBONATES.—*Clericus.*—It is an expensive process, requiring an apparatus of furnaces, &c., &c.

COURSE OF CROPPING.—*J. L. T.*—We should think that one-half your farm being in Grain crop, the other half might be cropped as follows:—1-3rd Clover, 1-6th Swedes, 1-6th Carrots, 1-6th Mangold Wurtzel, 1-6th Potatoes. Supposing you have 12 fields, your rotation would then be thus:—1 Wheat, 2 Swedes, 3 Wheat or Barley, &c. sown down with Clover-seeds, 4 Clover, 5 Wheat, 6 Potatoes, 7 Wheat or Barley, &c.; 8 Mangold Wurtzel, 9 Wheat or Barley sown down with Clover-seeds, 10 Clover, 11 Wheat, 12 Carrots. We believe by crossing the Down ewe with the Cotswold ram you will obtain as useful a stock of sheep as any one who intends to grow *fat mutton* can obtain. Thanks for your instructive letter. The per centage of potash given in your analysis is so great as to make us doubt its accuracy.

EXTIRPATION OF THE REED.—*J. McJ., Hillsborough.*—Drain the land, and this plant will ultimately die out of it. We doubt the efficacy of specifics for particular weeds, such as the application of salt, &c. Many thanks for your voluminous paper.

FARM ACCOUNTS.—*A Beginner.*—Put the *whole real value* of everything that belongs to you, live stock among the rest, to credit. More on this subject hereafter.

FIXER OF AMMONIA.—*A Subscriber.*—Sulphuric acid. Put it by degrees into the tank till effervescence stops.

GRASSES.—*A Novice.*—Messrs. Drummond and Son recommend ½ bushel of Perennial Rye-grass, 6 lbs. of Timothy, 6 lbs. of Meadow Fescue, 3 lbs. of hard ditto, 3 lbs. of Meadow Foxtail, 3 lbs. of Cocksfoot, 3 lbs. of Cow-grass, 6 lbs. of White Clover, as seed for one acre.

GYPSEOUS MARL.—*A Subscriber.*—We think it would be a most valuable top-dressing for Grass. Try ten cubic yards per acre, uniformly spread.

INSECT-KILLING MANURE.—*W. Cormack.*—We will publish the well-authenticated results of experiments, but cannot insert such a general and apparently extravagant statement as that you send.

LIME.—*G. B. M.*—Lime has been applied on the siliceous soils of Whitfield-farm before scarifying the Turnip land in March for Barley, before ploughing Clover-lea in Oct. for Wheat; and on Oat, Wheat, and Barley-stubble in autumn for the fallow-crop of the following year, and in all these instances with *uniformly* good effect.

LUCERNE.—*G. B. F.*—See Home Correspondence.

MANGOLD WURTZEL.—*γ & δ.*—Mid-April is the proper seed-time. We shall refer to the subject shortly.

MANURES.—*A Beginner.*—Your compost will be benefited by being soaked with liquid manure;—what compost would not?

MARKETS FOR YEARLING CATTLE.—*J. Clark.*—Barnstaple fair, Devonshire, April 21, Sept. 19, for Devon; Steyning fair, Sussex, June 9, for Scotch cattle; Hereford fair, July 18, and Oct. 22, for Hereford; Abingdon fair, Berks, Aug. 5, Sept. 19, for various breeds; at Barnet fair, Herts, April 8, 9, 10, for Scots, or anything you wish.

MARKETS.—Thanks for your suggestion, but we cannot at present adopt it.

MURRAIN.—*Anonymous.*—Your question will be answered if you will inform us which you mean—that usually called "the epidemic," which affects the feet and mouth; or the formidable disease of the chest termed pleuro-pneumonia.

NO. OF ACRES FOR ONE MAN'S EMPLOYMENT.—*W. P.*—It depends on the soil. One man can manage with the spade, 8 or 10 acres of light soil.

POND-MUD.—*L. B. W.*—Mangold Wurtzel and Cabbage will grow luxuriantly on your land. You could hardly do better. Apply wood-ashes to the land before sowing your grain crops, in September for Wheat, and in March for Oats and Barley, previous to harrowing before the drill. 40 bushels an acre might then be applied.

PRODUCTIVE BARLEY.—*O. M.*—Your notice is an advertisement.

SALT.—*Agricola.*—With the number of yards of ditch-scourings you intend to put on an acre, mix 1 cwt. of salt. Do not attempt to kill the weeds with that, lest in your success you have to lament the death of more valuable plants also. The hoe is the true remedy for weeds.

STEEPING SEEDS.—We believe that Mr. Campbell sells a liquid for Turnip seed. We shall be glad to hear your results.

STEAMING APPARATUS.—*A Subscriber.*—Potatoes are almost the only root generally steamed. Parsnips and Carrots are very well, when steamed for pigs; and Swedes are sometimes steamed for cattle. We never advertise tradesmen; it would subject us to stamp-duty. Most machine-makers manufacture a steaming-apparatus.

SWEDES.—*C. G. Sidy.*—Though we have heard it often, yet we do not *know*, if success attends general transplantation of young plants instead of sowing; therefore we do not like to advise. Try it on half an acre this year, and if it succeeds try a larger extent next. It has the advantage of hindering attacks of fly, &c.

TOLLS.—*W. C.*—We cannot advise our correspondent without seeing the local Act regulating the tolls. If he will furnish us with a copy of it we will endeavour to give him the information which he requires. We believe that local Acts universally provide that a person who has paid a toll shall not be liable to a second on the same day, but the right to claim the exemption in general depends on the wording of the particular Act.

*** As usual, many communications have been received too late for answering this week.

Markets.

SMITHFIELD, MONDAY, Feb. 26.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	10 to 4s	2	Best Downs & Half-breds	4s	0 to 4s	6
Best Short Horns	3	6	3 8	Best Long-wools	3	8	4 0
Second quality Beasts	3	0	3 2	Ewes and second quality	3	4	3 8
Calves	4	0	5 0	Pigs	3	0	4 4

Beasts, 2319; Sheep, 24,560; Calves, 83; Pigs, 327.

Our supply of Beef to-day is very small, and there is an advance in the best qualities of 2d per 8 lbs.; some few Short-horns have, perhaps, made 3s 10d per 8 lbs., but cannot be quoted as a general price. The trade is still dull, but the shortness of supply causes all to be sold off. The Mutton trade is very heavy; the best small Downs support our former quotation, large Downs are a slow sale at a little less money, and Long-wools are fully 2d per 8 lbs. less than last week. Veal trade is steady. Pork very heavy, and it must be superior quality to make our highest quotation.

FRIDAY, March 1.

Although we have a short supply to day, it is difficult to maintain Monday's prices; there is, however, no quotable difference. The trade is remarkably dull, the demand on a Friday being generally so very small through Lent. The only briskness we can at all discover is in the Veal trade—the best quality being scarce, they are readily sold at 5s per 8 lbs. Pork is lower.

Beasts, 437; Sheep, 2350; Calves, 124; Pigs, 280.

41, West Smithfield.

POTATOES.—SOUTHWARK WATERSIDE, Feb. 26.

THE weather during the past week has been much like the preceding one—remarkable for its changeableness. The market has been supplied from most of the shipping districts since our last Report, but by no means liberal, yet fully equal to the present demand. The information received from most of the principal shipping districts of the scarcity of Potatoes imparts firmness to holders of the best samples, but it does not induce the retailers to purchase beyond their present wants; they considering that there are plenty of Potatoes left to supply this market, at the present languid demand, as the advance in price has caused a decrease in the consumption.

WOOL.—BRITISH, FRIDAY, March 1.

THERE has been hardly as much business doing in our market during the past week. Those parties who have been desirous of forcing sales have been obliged to submit to a reduction in price, but, upon the whole, we think prices may be quoted the same as last week. All parties are looking forward anxiously to the approaching Wool Fair at Bristol, which will be held on the 6th and 7th March.

KINGSFORD AND LAY.

MARK LANE, FRIDAY, MARCH 1.—We had very little English Wheat fresh up for this morning's market; dry parcels, being scarce, were fully as dear, but a large proportion of that sold last week and on Monday was refused, in consequence of its bad condition, and could only be disposed of at a considerable reduction. The business in free Foreign was limited, but its value is maintained. We only heard of one sale of Bonded Wheat, in which we observe no alteration.—Barley is the turn lower.—Beans and Peas remain as last quoted.—Oats are a dull sale, and Irish 6*d.* per quarter cheaper.

KINGSFORD AND LAY.

COVENT GARDEN, MARCH 1.—Although the weather still continues changeable, the Market is well supplied, and trade begins to get a little brisker. Pine-apples have been more plentiful during the week; they are offered at nearly the same prices as quoted in our last Report. Little alteration has taken place in the prices of Grapes, which are still sufficient for the demand. The supply of foreign Apples has been well kept up during the week; but English ones are scarce. Some good dessert Pears are still offered; they bring nearly the same prices as last week. Oranges are improving in quality, and are very plentiful. Lemons are offered at from 1*s.* to 2*s.* per dozen; Chesnuts are selling at nearly the same prices as last week. A few ripe Strawberries are in the Market. Among vegetables Savoys are becoming less plentiful. Brussels Sprouts are still selling at nearly the same prices as mentioned in our last report, as are also Greens, which are plentiful. Carrots and Turnips continue to be pretty well supplied. Broccoli has been more abundant during the week; a large white variety is selling at from 8*s.* to 12*s.* per dozen. A slight alteration has taken place in the price of French Beans; they are selling at from 2*s.* 6*d.* to 3*s.* 6*d.* per 100. Asparagus, Seakale, and Rhubarb are plentiful, and are offered at nearly the same prices as last week. Celery is becoming scarcer. Cucumbers are a little reduced in price. Cut Flowers chiefly consist of Combretum purpureum, Erica Willmoreana, Burchellia capensis, Lachenalia tricolor, Acacias, Azaleas, Pelargoniums, Camellias, Primulas, Moss, Provence, and China Roses.

MARK FOTHERGILL.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of the subject, and had much experience in the erection of [illegible] apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined therewith economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. Rendle, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON, and at CORNWALL-ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 18 inch	.	.	£2 13s. 0d.
Rogers' Boiler, small size	.	.	1 17 0

Larger in proportion.

Hot-water Pipe, at 2, 3, and 4 inches, at reduced prices.

The TANK SYSTEM on an improved principle, that will heat the house at the same time, without pipes.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST-IRON RICKSTANDS, 2 feet six inches high, 5s. 9d. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

STRONG IRON HURDLES, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles,	3 ft. 6 in. high,	weighing	42 lbs.,	4 0	,,
Strong	do.	do.	do.	45 lbs., 4 4	,,
Ox Hurdles,	4 feet high,		do.	60 lbs., 5 6	,,

BEST WIRE, for STRAINED WIRE FENCING, at 9s. 6d. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every kind of Fencing, Fancy Wirework.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 3s. 4d.; 5 ft., 9s.; 5 ft., 11s.; 6 ft., 15s.; 7 ft., 20s. per dozen.

SHOW-ROOMS at the Manufactory, No. 2, WINSLEY-STREET, where every information may be obtained.

W. A. ROWLAND'S IMPROVED METALLIC WIRE, for WALL-TREES, VINES, and FLOWERS.

This WIRE having given great satisfaction, and its utility being, from the experience of several years, now fully *established*, the INVENTOR most respectively acknowledges the extensive patronage he has received, and as the season is now approaching when it will be in requisition, he respectfully begs to inform his customers that he has been enabled to reduce the List of Prices; and he assures them that no expense or exertion will be spared to render the article deserving of their continued approbation.

IMPROVED NAILS for fastening the Wire, being made so as not to cut or injure the Trees.

Also, IMPROVED METALLIC LABELS and INDELIBLE INK, for naming Flowers, Trees, &c.

Observe, each article has the name of "ROWLAND" affixed to it.

Sold wholesale and retail by Messrs. DICKSON, Seedsmen, Chester, and retailed by all respectable seedsmen throughout the kingdom.

Garden Implements, Engines, Syringes, &c.—Chester, Feb. 14.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

GENUINE PERUVIAN & BOLIVIAN GUANO ON SALE, BY THE IMPORTERS, ANTONY GIBBS AND SONS, LONDON; GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL.

47, Lime-st., Feb. 31. 1844.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported.—Apply to COTESWORTH, POWELL, and PRYOR, London; EDWARDS, DANSON, and Co., Liverpool; or WILLIAM J. MYERS and Co., Liverpool, the Importers.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with Synopsis of mode of use, on applications to MARK FOTHERGILL, 40, Upper Thames-street, and 5, Railway Place, Mark-lane, London.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt. Phosphate of Potash, 15s. per cwt.

" Soda . 12s. "
" Magnesia 9s. "
" Ammonia 1s. per lb.

MANURES FOR WHEAT, &c.

POTTER'S GUANO.—Result of an Experiment on Wheat, tried near Colchester—sown Nov. 1842, reaped August 1843. POTTER'S GUANO.—Seven bushels per acre gave 54½ bush. Grain. Daniell's Manure, 40 bush. per acre, gave 46 bush. Grain. Difference in favour of POTTER'S GUANO, 8½ bush.

Note.—The Daniell's Manure cost 3l. POTTER'S (present price) 2l.—Works 28, Upper Fore-street, Lambeth; sold by M. FOTHERGILL, 40, Upper Thames-street.

BEAUTIFUL FLOWERS.—POTTER'S CONCENTRATED LIQUID GUANO, for Flowers, Kitchen Garden Produce, &c. Sold by appointment, by SAVORY and MOORE, Chemists to the Queen, 136, New Bond-street, and 220, Regent-street, and can be had of most respectable Chemists and Seedsmen. Price 1s. 9d. the quart bottle, with directions.

DR. LINDLEY, in the *Gardeners' Chronicle* for 1843, p. 560, says—"POTTER'S GUANO will convert your desert into a paradise." And in the Number, Feb. 10, 1844—"POTTER'S GUANO is unrivalled."—Works, 28, Upper Fore-street, Lambeth.

HYACINTHS AND GROWING STOCK.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1s. 9d. each, by FLANAGAN and SON, Mansion-house-street; HURST and MCMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-within; SMITH, Islington Nursery; GRIMLEY and Co., Covent Garden; BATT and RUTLEY, 412, Strand; WILLIAM and JOHN NOBLE, Fleet-street; SMITH, Covent Garden; CHARLWOOD, Tavistock-row; W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 18, Piccadilly; JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 156, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and SON, Islington; J. FRYER, Clarendon-terrace, Camberwell; THOMAS ANSELL, Camden Town; THOMAS WATKINSON, Market-place, Manchester; T. S. KING, Rochester: W. E. RENDLE, Plymouth; DICKSON and Co., Edinburgh; PONTEY, Leeds; FISHER, HOLMES, and Co., Sheffield; P. LAWSON and SON, Edinburgh; J. THORNE, Shepton Mallet; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper-Thames-street, London.

THE NEW MANURE.

HUMPHREYS'S FARMERS' COMPOUND, presenting superior advantages to any Manure yet offered to the Public. It is rich in the Phosphates, Silicates, and Nitrogen, with certain new agents, so as to prove most economical and effective for Wheat, Barley, Pulse, Potatoes, Meadow Land, &c. Being manufactured on a new principle, this Manure *will not wash out of the soil* like Guano or the Salts, but with the mild and lasting qualities of the "Home-made" combines the most energetic fertilising chemical agents; adapted to all the purposes of Husbandry and Garden Culture, and unrivalled as a TOP-DRESSING for all Spring Crops. 12s. per cwt.—Wholesale Agents, DAVY, MACKMURDO, & Co., 100, Upper Thames-street, London.

LIQUID MANURE.

PUMPS of a Superior Construction, fixed and portable, for Liquid Manure. Garden Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps for Ships, Barges, Tanners, Soap-boilers, Brewers, &c. Well Digging and Boring executed, BENJAMIN FOWLER (late George Turner,) 63, Dorset street, Fleet-street.

HORSE POWER SUPERSEDED IN AGRICULTURAL OPERATIONS.

THE INVENTOR of a most efficient and economical SUBSTITUTE for ANIMAL and STEAM POWER, invites the attention of Capitalists to his important Discovery, particularly those interested in the prosperity of Agriculture.

A considerable amount of Capital being required, which must be obtained under great disadvantages, the advertiser is prepared to make such arrangements with any respectable party as would secure them from loss under all circumstances, and ensure to them a liberal share of the profits.

Prepaid letters, addressed Mr. ALEXANDER, No. 18, Easy-row, Birmingham.

THE URATE of the LONDON MANURE COMPANY, 5l. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

TO NOBLEMEN, AGRICULTURISTS, and OTHERS.

ANALYSES of SOILS, MANURES, &c., are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, Victoria Cottages Hawley-road, Kentish-town. N.B.—A Vacancy now occurs for One House or Out-door Pupil.—Apply as above.

TO AGRICULTURISTS.—IMPORTANT DISCOVERY.

"Quid faciat lætas segetes."—VIRGIL.

THE CORN-PRODUCING LIQUIDS.—"One of the most extraordinary exhibitions in the yard (at the late Agricultural Show, Dundee), was that presented by Mr. JAMES CAMPBELL, of the Dundee Public Seminaries. It consisted of magnificent plants of Oats and Barley, grown from seed which had undergone a certain chemical preparation, and without the aid of any manure whatever.

"Such a mode of culture is at variance with all practical experience; but Mr. CAMPBELL declares that his prepared seeds, which have produced these strong, healthy plants, were sown by him on land which, to his certain knowledge, had had no manure of any kind for eleven years; and he declared himself quite ready to verify his statement by experiment, and said he was willing, at any time, to impregnate with his chemical preparations the seed which any member of the Society should send to him for that purpose, so as to enable gentlemen to satisfy themselves fully as to the efficacy of this wonderful mode of culture."—*Journal of Agriculture, October*, 1843.

In this discovery is actually realised that boast of science, which some years ago prophetically asserted, that the time would soon come when one might carry in his pocket matter sufficient to manure an acre of land.

After impregnation with these liquids, the seed possesses within itself elements which not only afford additional nourishment to the grain during the progress of germination, but communicate to the expanding vessels of the plant an aptitude to absorb food, both from the soil and the atmosphere.

Of one specimen of Oats exhibited, the average produce of 33 seeds was 1600 grains from each, or a total of 52,800 grains, weighing 48 lbs. per bushel.

The produce of Barley was an average of upwards of 500 grains from each seed sown; and of Wheat sown on 5th July, and taken up on 8th August, to be exhibited, the result was, that while the unprepared seeds gave plants with two, three, and four stems only, the impregnated grain yielded plants with nine, ten, and eleven stems.

The material for these liquids, at the following prices, may be had of the following Agents.

Wheat . . .	material for one gallon	. .	2s. 6d.
Barley . . .	do.	do. . .	2 0
Oats and Grasses .	do.	do. . .	1 6
Beans and Peas .	do.	do. . .	2 0
Turnip and Rape-seed	do.	do. . .	2 6

Agents:—Messrs. GEORGE GIBBS & Co., 26, Down-street, Piccadilly, and Mr. EDWARD PURSER, London Manure Company, 40, New Bridge-street, London; JAMES HADEN, Ironmonger, Warminster, Wilts; CROUCH & Co., Newcastle-on-Tyne; P. BRUCE, Hull; JOHN CAMPBELL, 5, Mersey-street, Liverpool; SAMUEL WALDIE, Carlisle; W. W. FYFE, *Agriculturist* Office, Berwick; and F. KARKEEK, Truro.

One-third, or even one-half less grain, is required for seed than is commonly used; and twelve gallons will impregnate eight bushels of grain; for the operation may be repeated in the residual liquid with additional measures of grain, as not more than one-tenth is absorbed in each operation.

Particular printed instructions for using the liquids will accompany invoices. No order under 20 gallons will be supplied.

1, Dudhope-street, Dundee.

SUPERIOR SUBSTITUTE FOR TARPAULIN, &c.

C. MACINTOSH & Co. having made a considerable reduction in the price of the Patent India Rubber Covers for Carts, Waggons, Ricks, &c., beg to call the attention of Users of Tarpaulin and Oiled Sheets to the superiority of their manufacture as an effectual protection against wet, not liable to crack on being folded, and more economical than any other Waterproof cover.—22, York-street, Manchester; and 46, Cheapside, London.

THE LATE MR. LOUDON.—The following Subscribers to the Works of the late Mr. LOUDON have been obtained since making up the List which appeared in the *Gardeners' Chronicle* of Saturday last:—

ARBORETUM BRITANNICUM.—10l.

John Wolfe, Esq. Kennington
James Yates, Esq., F.R.S., L.S., &c., 49, Upper Bedford Place

Orange Tubs
Flower Boxes, &c.

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

GREAT YARMOUTH NURSERY, NORFOLK, 1844.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

A SELECT CATALOGUE of the NEWEST and VERY BEST VARIETIES OF FUCHSIAS, VERBENAS, PETUNIAS, CHRYSANTHEMUMS, & ANAGALLIS, offered by YOUELL & Co.

YOUELL & Co., in submitting their Catalogue of FUCHSIAS for 1844, take this opportunity of drawing the attention of admirers of the above elegant tribe of plants, to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attended their mode of selection last season, collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12*s.*, the Selection left to Youell & Co.
12 ditto ditto 21*s.*, the Selection left to the Purchaser.
50 Fine varieties . . 40*s*, the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s.*, the Selection left to the Purchaser.

With the exception of those marked thus. *

The plants will be strong and healthy, and ready for delivery by the latter end of March, with the exception of those marked thus * (which will be ready in April), thus ensuring the Purchaser fine plants for competition in the ensuing season. Many of the varieties can be supplied now.

NEW AND SPLENDID SEEDLING FUCHSIAS.

* "FUCHSIA LINDLEYANA." This brilliant Fuchsia, the entire stock of which is in the possession of YOUELL & Co., is now for the first time offered to the notice of the public.

Its exceedingly large tube and sepals are of the most vivid vermilion, and excessively expansive, surpassing in brilliancy any hybrid that has yet been raised. It was exhibited at the London Horticultural Society's Meeting, Regent-street, and greatly admired, and was pronounced by all who saw YOUELL & Co.'s specimen plant to be the most dazzling object of this tribe they ever witnessed. The foliage and habit exceedingly fine, a most abundant bloomer, and will be found a desideratum to every collection. Plants will be ready for delivery by the first week in April, at 7*s.* 6*d.* per plant. Usual discount to the Trade, when not less than six plants are ordered.

YOUELL & Co., in calling the notice of Amateurs and others to the following seedling Fuchsia, raised in their nursery, beg to state that in the summer of 1842 they bestowed every care in hybridising the best varieties in cultivation, from which they succeeded in raising upwards of 3000 plants, to the flowering of which one house was entirely devoted last year. And although many varieties possessing superior claims to the attention of those cultivating this elegant tribe, were submitted for the opinion of Dr. LINDLEY, and most favourably noticed, yet YOUELL & Co. feel that, in making a selection of the following six varieties, to which a most accurate description is affixed, will prove not only satisfactory to the purchaser, but to themselves.

These will be ready for delivery in April next, and as the stock is very limited, early orders are solicited.

* "QUEEN VICTORIA." Tube and sepals smooth, of a bright vermilion, corolla stout, long, of a fine purple rose colour, forming a good contrast, and of fine texture, price 7*s.* 6*d.* per plant.

* "PRINCE OF WALES." Tube and sepals rosy vermilion, the latter tipped with green, expanding well, and showing a fine corolla of maroon purple; price 7*s.* 6*d.* per plant.

* "PRINCESS ROYAL." Tube and sepals bright red, corolla large and peculiarly bright in colour; price 5*s.* per plant.

* "MARCHIONESS OF NORMANBY." This is a large and showy flower, measuring four inches from the commencement of the pod to the termination of the pistil, tube and sepals scarlet, corolla stout, having a tinge of purple on it; price 7*s.* 6*d.*

* "LADY ALICE PEEL." A flower of good form and substance, fine rosy red tube and sepals, the latter terminating in a decided green, corolla very large and stout, of a beautiful crimson purple; price 5*s.* per plant.

* "LADY WALSINGHAM." Tube and sepals smooth, of a rosy vermilion, the latter turn up, and expose the whole of the corolla, which is stout, and of a fine purple crimson; price 5*s.* per plant. When the six are ordered, they will be charged 1*l.* 11*s.* 6*d.* the set.

"FUCHSIA QUEEN." Quite new, very beautiful, and not yet out, tube and sepals large and stout, of pure white, showing a dark crimson corolla; price 10*s.* 6*d.* p. plant; ready in April next.

Fuchsia Seed, saved from the best varieties, 6*s.* to 10*s.* per packet, with Directions for sowing, &c. &c.

With every other variety worthy of cultivation, that may be advertised by other parties after the publication of this list.

YOUELL & Co. are preparing a short treatise upon their successful mode of cultivation of the Fuchsia, which will be presented Gratis to Purchasers.

VERBENAS.

*"MONARCH" (Youell's) is a delicate creamy white, surpassing in its size and fragrance every other variety; the tufts of bloom measuring from 3½ to 4 inches diameter, and will be sure to give satisfaction. Price 5*s.* per plant.

* "BRILLIANT," (Youell's). This fine variety is of the most vivid scarlet, equal in this respect to "Melindris;" the bloom, however, is three times the size, and very fragrant, and will prove most desirable in any collection. Price 3*s.* 6*d.* per plant.

*"ELEGANS" (Youell's), is a most interesting variety, being a delicate lilac, with a distinct white eye; flower large and fragrant. Price 3*s.* 6*d.* per plant.

*"SURPRISE" (Youell's), can be recommended as a variety completely novel, and one that must be cultivated in every collection, the colour being of the richest rosy crimson, or ruby, producing tufts of flowers of 3½ ins. in diameter, and delightfully fragrant. Price 5*s.* per plant.

The above four varieties have been selected from upwards of 2000 Seedlings, and may be confidently relied upon as possessing superior claims, and will be sure to give satisfaction; will be ready to send out in April next (post-free). If the four varieties are taken, they will be charged 15*s.* the set.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.)

Directors.

Chairman.—Robert Currey, Esq.

Edward Baker, Esq. | Thomas Bax, Esq.
Jasper Capper, Esq. | Joseph Cooper, Esq.
Thomas Dakeyne, Esq. | Russell Jeffrey, Esq.
Giles Redmayne, Esq. | William R. Spicer, Esq.
James Spicer, Esq. | Joseph Sterry, jun., Esq.
Henry Sterry, Esq. | Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*

A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

MUTUAL LIFE ASSURANCE SOCIETY, No. 37, Old Jewry, London.—Established 1834.

DIRECTORS.

S. Adams Beck, Esq. | W. Chapman Harnett, Esq.
James Burchell, Esq. | Jonathan Hayne, Esq.
John Clayton, Esq. | Valentine Knight, Esq.
Solomon Cohen, Esq. | Colonel Robinson.
John Cole, Esq. | Samuel W. Rowsell, Esq.

TRUSTEES.

John Clarke, Esq. | Phillip C. Moore, Esq.
Richard Groom, Esq. | Henry Thomas Windsor, Esq.

ACTUARY: Peter Hardy, Esq., F.R.S.

Extract from the Report of the Directors of the Society, to a General Meeting of the Members, holden the 17th January, 1844:

"At the end of the six years which have been completed since the 31st of December, 1837, there are in existence in the Society three times as many policies as there were in existence at the end of the year 1837. The capital sums assured under these policies are nearly doubled in amount. The corresponding income derived from annual premiums is also nearly doubled. The accumulated property of the Society is four times as great as it was at the end of that year, and the present divisible surplus is nearly six times as much as that declared in the division of the year 1837."

The Directors invite the public to compare the following Table of the Additions made to the Ten oldest existing Policies in the Society, up to the 31st of December, 1843, with the additions made by other Societies within the same time:—

1834. Policy No.	Sum Assured.	Premium.	Age at Admission	Total Addition made in 1842.	Increase, 1843.	Total Addition made in 1843.	Amount of Premiums paid.	The total addition is equivalent to the following per centage on the amount of premiums paid.
	£	£ s. d.		£ s. d.	£ s. d.	£ s. d.	£ s. d.	
1	1000	24 0 0	29	146 12 0	24 4 0	170 16 0	289 0 0	61

PETER HARDY, Actuary.

Price, in cloth, 1*s.*; stitched, 6*d.*

VILLAGE HORTICULTURAL SOCIETIES.—History, details, and rules of that established in 1837, at Pytchley, Northamptonshire; together with the rules of the Labourers Land Allotments, and engravings of the old Hall and Gateway lately removed.

"How much innocent and simple enjoyment, how much additional comfort might be promoted in English villages, were such societies more general."

Sold by PARKER, London; and DASH, Kettering.

On January the 8th, 1844, was published, handsomely printed, in Demy 8vo, Part the First, Price 12*s.*,

SPECIES FILICUM; OR, A SYNOPSIS OF ALL KNOWN FERNS. This first Part contains GLEICHENIACEÆ, POLYPODIACEÆ in part, and PLATES i. to XX. By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., F.R.S., &c. &c., Vice-President of the Linnean Society, and Director of the Royal Botanic Garden at Kew.

*** Part the Second was published on the 1st of March, 1844.

London: WILLIAM PAMPLIN, 45, Frith-street, Soho-square.

Cloth, gilt edges, price 6*s.*; silk, 7*s.* 6*d.*; or morocco elegant, 8*s.* 6*d.*

THE SENTIMENT of FLOWERS; with Twelve Groups of Flowers, tastefully designed and coloured.

"In eastern lands they talk in flowers,
And they tell in a garland their loves and cares:
Each blossom that blooms in their garden bowers
On its leaves a mystic language bears."

This work teaches the eloquent language referred to in the above beautiful lines. As in the East, so in the fair island of Britain, "flowers are here made the language of sentiment."

"A charming little book. With a dozen of sweet floral coloured plates, it is precisely the thing for a fair lady's boudoir."—*Literary Gazette.*

HOULSTON & STONEMAN, 65, Paternoster-row; J. MENZIES, Edinburgh; and S. J. MACHEN, Dublin.

SECOND SERIES of TYAS'S POPULAR FLOWERS.

This day is published, price Sixpence,

THE RANUNCULUS (with a coloured plate), being its Propagation, Cultivation, and general Treatment simply laid down. With a List of choice varieties. Also, price 6*d.* each, with a coloured plate, the Pink, Geranium, Pansy, Fuchsia, Carnation, Dahlia, Rose, Camellia, Cactus, Chrysanthemum, Auricula, Hyacinth, and Tulip.

HOULSTON & STONEMAN, 65, Paternoster-row; J. MENZIES, Edinburgh; and S. J. MACHEN, Dublin.

BEE-HIVE.—THE BAR AND FRAME-HIVE.

Early in April will be published, by Mr. JOHN VAN VOORST, of Paternoster-row, in the form of a pamphlet, for the convenience of transmission through the Post-office,

A DESCRIPTION of the BAR and FRAME BEE-HIVE, invented by W. A. MUNN, Esq., with some short Directions for the Management of an Apiary.

A Bar and Frame-Hive may be seen at Mr. JOHN MILTONS', No. 10, Great Marylebone-street, London.

ALL the FASHIONS for MARCH 1, 1844, in immense variety, consisting of Morning, Evening, and Dinner Dresses; Caps, Bonnets, Coiffures, &c.; just published in the LADY'S BLACKWOOD MAGAZINE of FASHION for March. Such a combination of Fashions was never before presented to the Public, and the Illustrations will be of intense interest, entitled "Views in India and Affghanistan;" while the Literature will consist of Tales, Romances, Poetry, &c. Price only 2*s.*

BLACKWOOD & PAGE, at the office, 154, Strand; and may be had of all booksellers in the world.

Fifteen Volumes of Blackwood's Lady's Magazine are now completed to December, 1843, which may be had in sets at 5*s.* per Volume, or single (each Volume of six Parts complete) Volumes at 10*s.* 6*d.* The whole are beautifully bound in green and gold, well calculated for general perusal and reference. The last two Volumes contain the following Embellishments, alone worth the price; also 36 Plates of Fashions, representing upwards of 140 figures, taken from life, attired in all the novel costumes of the day, coloured by a new process; rich in literary articles, and contain nearly two thousand pages of closely-printed letterpress, each Volume being equal to four guinea-and-half novels of the present day. May be ordered of any bookseller at this price in town or country, or purchased at the office as above. No. for January, 1843: GROUP of INDIAN WOMEN. No. for February: GRAND PALACE at CANDAHAR. No. for March: A full-length PORTRAIT of LADY SALE, as she appeared in the advanced guard of the British army, in the late disastrous retreat from Cabul, under a heavy fire from the Ghilzees, during the passage of the Khoord Cabul Pass, January 9th, 1842. No. for April: INDIAN BRIDGE OVER a GULLY, and Grand Mountain and River Scenery. No. for May: AKHBAR KHAN and Sir W. M'NAGHTEN. No. for June: WHOLE of the CABUL PRISONERS—THE MEETING; an Authentic Sketch, by an Officer, taken at the time (at an expense of Fifty Guineas), representing the joyful meeting of Lady Sale with General Sale and his brigade. No. for July: MOUNTAIN PASSES, and grand Mountain Scenery, with Rivers, Bridges, &c. &c. (Two Plates.) No. for August: a full-length Authentic PORTRAIT of Mrs. ALFRED SHAW, the Popular Singer. No. for Sept.: Full length PORTRAIT of LADY M'NAGHTEN, on a camel, in the Khoord Cabul Pass. No. for October: GRAND ENTRANCE to a SERAI. No. for November*: the CITY of CABUL, from a Sketch by Lieut. Skinner. No. for December: the AUBDOUR, WATER-COOLER, or Luxuries in India during the hottest part of the summer.

Also, by the same publishers (just out, 13th thousand),

The ILLUSTRATED COMPANION to LADY SALE'S JOURNAL.

Price 2*s.* 6*d.*, seven fine large Plates.

* Any of the back Numbers, price 2*s.* each, may still be had. Those containing Lady Sale, Lady M'Naghten, the Assassination of Sir William M'Naghten, and Cabul, have been reprinted.

HAMILTON'S TREATISE ON THE PINE, VINE, AND CUCUMBER, is now ready, and may be had, postage free, on receiving a post-office order of 6*s.*, of Mr. T. WILD, 3, Taveren-street, Ipswich; Mr. J. MASTERS, 33, Aldersgate-street, London; or, J. HAMILTON, Thornfield, Stockport.

SECOND EDITION.

MILLS'S TREATISE ON THE CULTURE OF THE CUCUMBER, MELON, SEA KALE, AND ASPARAGUS. Published by WILLIAM SMITH, 113, Fleet-street.

The truth of Dr. LINDLEY'S statement in his review of the above work was strictly verified at the late Great Exhibition of Cucumbers at Ipswich, viz., "Any person having Mills's book, whether a gardener or not, can grow Cucumbers."

By the report of the above exhibition in the *Gardeners' Chronicle*, the first prize was won by an amateur, Edward Leathes, Esq., on Mills's system.

MILTON'S BEE HIVES, &c.—A sheet of Illustrations, price 1*s.*, of the various Bee Hives, Feeding Machines, and other apparatus connected with the Apiary, being all the Plates of the "Practical Bee Keeper," a new work on Bees, published by J. W. PARKER, West Strand, and may be had of all Booksellers. The sheet of Illustrations will be sent post free on inclosing 1*s.* and a stamp—all letters pre-paid—to J. MILTON, 10, Great Marylebone-street, Wimpole-street.

BENJAMIN EDGINGTON respectfully informs the Nobility and Gentry, that he has made arrangements for SELLING OFF his extensive Stock of Marquees and Tents, the accumulation of years, at a reduced price. It consists of every variety of size and shape, from the colossal Tent, 300 feet in circumference; the extraordinary Marquee of 700 feet long, to the Garden Tent of 10 feet in diameter. The Public are invited to an inspection at his Manufactory, 2, DUKE STREET, SOUTHWARK. The Marquees and Tents will be found well worthy the attention of all requiring this very ornamental out-door accommodation. The Sale of this Stock will continue till the 25th of March.

THE MECHIAN DRESSING CASE, the most Portable ever invented, being only the size of a Pocket-book, and containing one pair of Mechi's ivory-handle peculiar-steel razors, his magic strop and comb, badger-hair shaving-brush, his patent castellated tooth-brush, and a neat useful nail-brush, price only 25*s.* The same, with hair-brush and soap-dish, 35*s* To Military men, and as a Steam-boat or Travelling-companion, this Invention is an invaluable acquisition. An immense variety of other Dressing Cases, both for Ladies and Gentlemen, either in fancy woods or leather, at all prices, to suit either the economical or the luxurious. An extensive stock of Writing Desks, Writing Cases, Work Boxes, and Bagatelle Tables, Razors, Strops, Table Cutlery, superb Papier Maché Articles, &c.—Manufactory, 4, Leadenhall-street, four doors from Cornhill.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130*B*, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

News of the Week.

THE seizure of Otaheite by Admiral Dupetit Thouars, which at one time threatened to compromise the relations between this country and France, has been formally disavowed by the French Government. The reason assigned for this important step is the absence of sufficient grounds in the circumstances, reported by the Admiral, for abandoning the Treaty of 1842, which established a French protectorate in Otaheite and confirmed Queen Pomaré in the internal sovereignty of the island. The Opposition papers, however, have eagerly seized the opportunity to charge the Cabinet with an unworthy concession to England, and they attribute the disavowal of the seizure more to the dictation of the British Ministry than to any desire on the part of the Government to respect the rights of Queen Pomaré. No circumstance has occurred since the stormy agitation on the Right of Search, which has so much aroused the national susceptibilities of the people, and the effect of it will, no doubt, add greatly to the unpopularity of M. Guizot. The Opposition in the Chamber of Deputies were to commence their attack on Ministers on Thursday. The result of that debate is looked for with some interest, though from the form in which the question will be brought forward it can have no practical effect on the immediate stability of the Cabinet, as no vote will be taken upon it. The Government it is said will defend themselves on the facts that they resolved to disavow the act at a Council which was held as soon as the intelligence was received—that (as Lord Aberdeen stated in Parliament last night) no remonstrance had been made by England—and that their disavowal was delayed solely at the request of the Minister of Marine, who asked as a personal favour for himself, and as a mark of consideration for the Admiral, that the final decision might be postponed for eight days. In the meantime the documents relative to the seizure have been laid before the Chamber, and we learn from them that the offence which induced the Admiral to depose Queen Pomaré was merely her substitution of a closed crown, as a mark of sovereignty, in the place of an open crown, the mark of a dependent Princess, in her national flag.—The insurrection in Spain is still unsubdued; the bombardment of Alicante commenced on the 17th, and a blockading army of 10,000 men has assembled before Carthagena.—The rebellion in Portugal may be regarded as extinguished, and the revolted troops are said to have retreated in despair across the Spanish frontier.

At home, the proceedings in Parliament have not been without interest. On Monday Mr. S. Crawford again brought forward his motion for stopping the supplies until the people's grievances be redressed, but the motion was negatived by 105 to 11, and the House proceeded with the Naval Estimates. On Tuesday Lord J. Manners brought forward a motion calling for the interference of this country in behalf of Don Carlos, but the motion was withdrawn without a division. On the third reading of the Horse Racing Bill Mr. Christie moved that it be read a third time that day six months, but the motion was negatived by a majority of 66. On Thursday, after a discussion on the formation of harbours of refuge on the coast of England, and on the establishment of railways across Ireland, to facilitate steam communication with America, the Clontarf meeting was again brought before the House. Col. Rawdon moved a vote of censure on Ministers for their delay in issuing their proclamation to suppress that meeting, but the motion was negatived by 90 to 62. Lord Worsley then obtained leave to bring in a Bill for the inclosure of waste lands, and stated at some length the mode in which he proposes to effect his object. Last night, Mr. T. Duncombe's motion respecting the Irish trials was negatived by a majority of 71.

Home News.

COURT.—Her Majesty and Prince Albert are expected to leave Windsor Castle this day, for Buckingham Palace. Her Majesty's stay in town will, in all probability, not exceed a fortnight, when the Queen will retire to Claremont for several weeks. Her Majesty and the Prince have taken their usual exercise in the grounds of the Castle during the week, when the state of the weather has permi ted it. The Prince of Wales and the Princesses have also had their usual airings in the Park, and are in excellent health. The Duchess of Kent is expected to take her departure from Frogmore House, this day, for Witley Court, on a visit to the Queen Dowager, where her Royal Highness will probably remain during the ensuing week.—Saturday was the birthday of his Royal Highness the Duke of Cambridge. The Duchess of Gloucester gave a dinner in honour of the day, at Gloucester-house, at which the Duke and Duchess of Cambridge and the Princess Mary were present.—Orders have been issued from the Lord Chamberlain's Office directing the Court to change the mourning for the late Duke of Saxe Coburg Gotha on Thursday next; to change it further on the 14th, and go out of mourning on the 21st inst.—The State apartments at Windsor Castle, which have been closed since the intelligence reached England of the death of the Duke, will it is expected be opened to the public as usual on Monday next.—The Duke of Cambridge has appointed Sir James Reynett Deputy Ranger of Richmond Park, in the room of the late Lord Sidmouth.

Death of Lord Wallace.—Lord Wallace died on the 23d ult., at his seat Featherstone Castle, Northumberland, in his 77th year. The late Baron married the widow of Henry Viscount Melville, and daughter of the second Earl of Hopetoun, by whom he has left no issue. Lord Wallace was Master of the Mint, and Vice President of the Board of Trade under the Wellington Administration, and was raised to the Peerage in 1828 by the title of Baron Wallace of Knaresdale. Before his elevation to the Upper House, his Lordship sat for Penryn and Weymouth. His Lordship dying without issue the title becomes extinct.

Foreign.

FRANCE.—The occupation of Otaheite by Admiral Dupetit Thouars has assumed an aspect of great importance. The Government have disavowed the seizure of the island, and published the following announcement in the official journal:—"Government have received despatches from the Island of Tahiti, dated 1st and 9th of November, 1842. Vice-Admiral Dupetit Thouars, who arrived in the Bay of Papaiti on the 1st of November, to carry into execution the treaty of the 9th of September, 1842, which the King had ratified, had deemed it his duty not to adhere to the stipulations of that treaty, but to take possession of the island. Queen Pomaré has written to the King to demand the fulfilment of the stipulations of the treaty which assured to her the internal sovereignty of her country, and to pray that she be maintained in her rights. The King, by the advice of his Council, not finding in the circumstances reported sufficient grounds for abandoning the treaty of the 9th of September, 1842, has ordered the execution, pure and simple, of that treaty, and the establishment of the French Protectorate in that island." The following is the letter of Queen Pomaré to Louis-Philippe, referred to in the above announcement:—"Poofai, Tahiti, Nov. 9, 1843.—O King, I have been this day deprived of my government. My sovereignty has been violated, and your admiral has seized, with arms in hand, on my territory, because I was accused of not observing the treaty of the 9th of September, 1842. I never intended, when I placed my crown on my flag, to condemn the said treaty and insult you, O King. I suppose you will not consider the fact of my placing my crown on my flag to be a crime. Your admiral only required a slight change in it, but had I acceded to his desire, I should have been despised by my great chiefs. I knew not, moreover, any article of the treaty which regulated the nature of my flag. I protest formally against the harsh measure taken by your admiral; but I have every confidence in you, and I expect my liberation from your compassion, your justice, and your kindness, for a powerless Sovereign. My prayer is the following:—May the Almighty soften your heart! May you acknowledge the justice of my claim, and restore to me the sovereignty and government of my ancestors. May God bless you, O King, and may your reign be long and flourishing! Such is my prayer. POMARE."—The following is the report of Rear-Admiral Dupetit Thouars, dated Bay of Papaiti, Tahiti, November 9, 1843:—"On my arrival here on the 1st, I forwarded to Queen Pomaré the ratification of the treaty of the 9th of Septembet, 1842. On the 3d, having ascertained that the Queen, being ill-advised, continued to hoist a flag which she said had been sent to her by the Queen of England, and feeling that I could not tolerate any longer such an insulting act for our national consideration, wishing moreover to put a period to her inconsistency, I adopted, agreeably to our rights of sovereignty, the resolution which I communicated to her, of hoisting the French flag in succession on all the places of defence and protection of the Society Islands.—DUPETIT THOUARS."—It appears that the flag which gave so much offence contained a *closed crown*, as the usual sign of sovereignty, which the Admiral required to be changed to an open crown, to signify that the queen, being under the protection of France, was no longer an independent sovereign.—The papers of Monday evening state that for the execution of their decision the Government has resolved to send a corvette to the South Seas, with the special mission of recalling Admiral Dupetit Thouars, and of establishing the authority of Queen Pomaré. It was rumoured that thirty-six members of the Chamber of Deputies had resigned their seats in that Assembly, disgusted with the acquiescence of Ministers in the demand of England, and that a meeting of Opposition Deputies was to be held that night at the residence of M. Thiers to discuss the expediency of an impeachment of Ministers. In the sitting of the Chambers on the same day it was expected that the affair would give rise to some interpellations, but nothing was said on the subject in the Bureaux, which were occupied with a question concerning the mode of taking the votes. The Deputies having subsequently removed to the hall of their sittings, M. de Carne ascended the tribune and said, "The *Moniteur* of this morning contains an announcement calculated to excite surprise. Queen Pomaré having refused to execute the treaty concluded with France, our Admiral, M. Dupetit Thouars, thought proper to supersede her in the government of the island. This act appeared equitable. Nevertheless, what do we read in the *Moniteur*? The disavowal of the Admiral's conduct, and his recall. I request the Chamber to fix a day for the interpellations which I intend to address to Ministers." M. Guizot here rose and declared that he was ready to enter into any explanation the house might require. M. Billault next observed that it was important that the assembly should be made acquainted with the despatch of the Admiral, which M. Guizot having agreed to communicate to the Chamber, it was decided that the interpellations should take place on Thursday. The interest of the affair is increased by the statement that Admiral Thouars is notorious for his professed hatred of England, and that he requested M. Thiers during the Anglophobia of 1840 to put him at the head of a squadron, with which he pledged himself to enter the Thames and burn every ship to be found between the Downs and the Tower of London.—The proposition of Colonel de Briqueville relative to the removal of the rémains of General Bertrand to the Invalids, to be there interred near those of Napoleon, was afterwards taken into consideration, only one member having alone opposed it. At a previous sitting M. Remuzat's motion for excluding public functionaries from the Chamber was rejected by a large majority. This motion arose out of the affair of M. Salvandy's resignation as Minister at Turin, and the debate on it was remarkable chiefly for the hostile speech delivered by M. Thiers against the King, and for his attack upon the participation of his Majesty in compelling the resignation of the Ambassador.—M. Charles Laffitte the Paris banker whose election at Louviers was, some weeks ago, almost unanimously annulled by the Chamber, owing to his having entered into some engagement with his constituents for the construction of a railroad, has been returned at the same place by a majority of 340 votes to 141. The Government would appear to have procured a candidate who has some chances of frustrating M. de Larochejaquelin's re-election at Ploermel.—Queen Christina slept at Avignon on the 22d, and arrived at Nismes in the morning of the 23d inst. The steam-boat in which her Majesty passed along the Rhone being overtaken by the night, she was obliged to land on the Ile de la Barthelasse, which she crossed by torchlight. The Prefect of Vaucluse offered her Majesty his carriage, in which she arrived safely at Nismes. The Queen went the same day to Montpellier, whence she was to proceed direct to Narbonne, in which town she proposed to rest on Sunday last, and on Monday to cross the Spanish frontier.—M. Dolle, editor of the journal *France*, was sentenced on Monday, for libel on the King, to eight months' imprisonment and 8000f. fine.—Public attention has been much excited by the murder of M. Donon Cadot, a wealthy banker at Pontoise, by a man named Rousselet. After several inquiries the murder has become more and more complicated, and has assumed a melancholy aspect. Rousselet, finding his own case hopeless, has not only confessed his participation in the crime, but has accused the youngest son of the deceased, a youth about 18 years of age, of having instigated him to it by promising him a reward of 100,000f., and also a young woman, named Caroline Mirandon, a servant of the father, and mistress of the son. The police of Pontoise arrested both the son and the girl on Saturday in a furnished hotel, where they were lodging under false names. The son was immediately interrogated, and answered all the questions put to him with the greatest self-possession and coolness, positively denying the truth of the charge made against him. The girl had been previously arrested, and was discharged for want of evidence, and as Rousselet had already accused two other persons whose innocence had been fully established, hopes are entertained that these two also may be able to exculpate themselves from the charge.

SPAIN.—The Madrid letters and papers of the 21st contain no news of importance from the disturbed districts. General Roncali commenced the bombardment of Alicant on the 17th. The blockading force assembled before Carthagena consisted of 6000 National Guards and 1000 soldiers of the line. The Consuls of England and France in that city repaired to Murcia on the 17th, and left again for Carthagena on the 18th. It was believed that they had come to offer terms of submission on the part of the insurgents. The insurgents were retaliating upon General Roncali for shooting seven officers taken at Murcia, by shooting 14 carabiniers who had the misfortune to fall into their hands. The son of General Tacon was appointed Secretary of the Spanish Embassy in London. Great preparations were in progress for the reception of Queen Christina at Madrid, and a circular had been addressed to the diplomatic body, the grandees and clergy, to the effect that the young Queen would proceed as far as Aranjuez to meet her mother, and that she would be much gratified if they accompanied her. M. Cortina and M. Madoz are still in prison and unable to communicate with their friends. Though the Government prosecutor has reported that there is no charge against them, it is still said that they are to be sent to Valencia to be tried by a court-martial. A letter from Barcelona of the 17th states that several persons have been arrested in that city, and among others M. Borell, one of the richest merchants in the place and a distinguished member of the liberal party. Domiciliary visits had been made to several of the inhabitants in search of arms and ammunition, of which a considerable quantity had been found. The possessors were sent to prison and are to be tried by court-martial. The disarmament of the National Guard was everywhere effected without resistance, and the greatest tranquillity prevailed throughout the province.

PORTUGAL.—Accounts from Lisbon of the 21st ult. state that the insurrection may now be regarded as extinguished, and there is little doubt that the revolted troops have at this moment retreated in despair across the Spanish frontier, where orders were given by the authorities to disarm them the moment they presented themselves and move them inwards. The latest intelligence comes down to the 19th inst. from Abrantes, the Governor of which place writes that a great many more of the soldiers of the 12th had rejoined their regiment, that not a peasant joined the rebellion or took part with it in any direction, and that the insurgents, both horse and foot, were disheartened. Their ranks, which but a few days before comprised 600 soldiers, were then, according to the best accounts, reduced to about 250 men. The fact of Count Bomfim taking the command has not been of the slightest service to them, and never in the history of Peninsular insurrections was a rebellion, which at one period looked somewhat formidable, so effectually and easily suppressed. Not a village in Portugal responded to the invitation of the insurgents. The Cortes met on the 21st for the purpose of conceding the extraordinary powers to Government till the end of March, till which time they stand prorogued.
